There are many reaſons why a church might be called *titulus*, *title*; the moſt probable, Cowel takes to be this, that in ancient days the name of the ſaint to whom the church was dedicated was engraven on the porch, as a token that the ſaint had a *title* to that church: whence the church itſelf became afterwards to be called *titulus.* See *Clerical* TITLE.

TITLES, or TITULAR *Churches*, M. Fleury obſerves, was formerly the denomination of a particular kind of churches at Rome. See CHURCH.

In the VI. and VII. centuries, there were four ſorts of churches in that metropolis, *viz. patriarchal*, *titular*, *diaconal* and *oratorial.*—The *tituli*, *titular*, were, as it were, pariſhes, each aſſigned to a cardinal prieſt, with a certain diſtrict or quarter depending thereon, and a font for the adminiſtration of baptiſm in caſe of neceſſity. See PARISH, CARDINAL, *&c.*

Clerical or *Sacerdotal* TITLE, denotes a yearly revenue or income of the value of 50 crowns, which the candidates for prieſthood were anciently obliged to have of their own; that they might be aſſured of a ſubſiſtance. See ORDERS, ORDINATION, *&c.*

By the ancient diſcipline there were no clercs made, but in proportion as they were wanted for the ſervice of the church, which is ſtill obſerved with regard to biſhops; none being conſecrated, but to fill ſome vacant ſee. See BISHOP, PRIEST, *&c.*

But for prieſts and other clercs, they began to make vague ordinations in the eaſt as early as the Vth century: this occaſioned the council of Chalcedon to declare all vague and abſolute ordinations null.

Accordingly, the diſcipline was pretty well obſerved till towards the end of the XIth century; but then it began to relax, and the number of prieſts was exceedingly increaſed; either becauſe the people became deſirous of the privileges of the clericate, or becauſe the biſhops ſought to extend their juriſdiction.

One of the great inconveniencies of theſe vague ordinations was poverty, which frequently reduced the prieſts to ſordid occupations, and even to a ſhameful begging. To remedy this, the council of Lateran laid it on the biſhops to provide for the ſubſiſtance of ſuch as they ſhould ordain without *title*, till ſuch time as they had got a place in the church that would afford them a ſettled maintenance.

There was alſo another expedient found out to elude the canon of the council of Chalcedon, and it was appointed that a prieſt might be ordained on the title of his patrimony; that is, it was not neceſſary he had any certain place in the church, provided he had a patrimony ſufficient for a creditable ſubſiſtance.

The council of Trent retrieved the ancient diſcipline in this reſpect, forbidding all ordinations, where the candidate was not in peaceable poſſeſſion of a benefice ſufficient to ſubſiſt him; and allowing no body to be ordained on patrimony or penſion, unleſs where the biſhops declare it to be expedient for the good of the church: ſo that the benefice is the rule, and the patrimony the exception.

But this rule is not regarded, even in ſome catholic countries, particularly France, where the patrimonial *title* is the moſt frequent; and the *title* is even fixed to a very moderate ſum, about 3*l.* 15*s. per annum* ſterling. Indeed at Paris, and in ſome other dioceſes, 150 livres are required.

As to religious, the profeſſion they make in a monaſtery ſerves them for a *title*, in regard the convent is obliged to maintain them: and as to mendicants, they are maintained upon the *title of poverty.*

Thoſe of the houſe, and ſociety of the Sorbonne, are alſo ordained without any patrimonial *title*, and on the ſole *title* of poverty, it being ſuppoſed a doctor of the Sorbonne can never want a benefice. See SORBONNE.

TITUBATION, or TREPIDATION, in aſtronomy, a kind of libration or ſhaking, which the ancient aſtronomers attributed to the cryſtallin heaven, to account for certain inequalities, which they obſerved in the motion of the planets. See TREPIDATION.

TITULAR, or TITULARY, denotes a perſon inveſted with a title, in virtue whereof he holds an office or benefice, whether he perform the functions thereof or not. See OFFICE, and BENEFICE.

In this ſenſe the term is uſed in oppoſition to ſurvivor, and to a perſon only acting by procuration or commiſſion. See PROCURATOR, *&c.*—An officer is always reputed *titular* till he have reſigned his office, and the reſignation have been admitted.

TITULAR is ſometimes alſo applied adjectively to a perſon who has the title and right of an office or dignity, but without having poſſeſſion, or diſcharging the function thereof.

It is ſometimes alſo uſed abuſively for a perſon who aſſumes and pretends a title to a thing, without either a right thereto, or a poſſeſſion thereof.

TITULAR *Churches.* See the article TITLE.

TMESIS, * ΤΜΗΣΙΣ, in grammar, a figure whereby a compound word is ſeparated into two parts, and one or more words interpoſed between them.

* The word is formed from the Greek, τεμνω, *ſeco, I cut.*

Thus, when Terence ſays, *quæ meo cunque animo lubitum eſt facere*, there is a *tmeſis*; the word *quæcunque* being divided by the interpoſition of *meo.*

Lucretius abounds in *tmeſes*; as, *ſæpe ſalutantum tactu præterque meantum:* or, *diſſidio potis eſt ſejungi ſeque gregari*; and, *diſpectis diſque gregatis.*

TOBACCO, or TABACCO, a medicinal herb, not known in Europe till after the diſcovery of America by the Spaniards, and firſt imported about the year 1560.

The Americans of the continent called it *petun*, thoſe of the iſlands *yoli.* The Spaniards, who gave it the name *tabaco*, took it from Tabaco, a province of Yucatan, where they firſt found it, and firſt learned its uſe.

The French, at its firſt introduction among them, gave it various names; as *nicotiana*, or the *embaſſador's herb*, from John Nicot, then embaſſador of Francis II. in Portugal, who brought ſome of it with him from Liſbon, and preſented it to a grand prior of the houſe of Lorrain, and to queen Catherine de Medicis; whence it was alſo called *queen's herb*, and *grand prior's herb.*—They alſo gave it other names, which are now all reduced to the original name *tobaco*, or *tobacco*, from *tabaco*, given it by Hernandez de Toledo, who firſt ſent it into Spain and Portugal.

Culture and preparation of TOBACCO.—*Tobacco* is cultivated in ſeveral parts of America, particularly in the Caribbee Iſlands, Virginia, *&c.* where they are forced to mix aſhes with the ſoil, to prevent its riſing too thick.—After ſowing, they water it every day, and on very hot days cover it up, to prevent its being ſcorched by the ſun.

When it is riſen to a convenient pitch, they tranſplant it, much as we do lettice, only at a diſtance of three feet, and in a ſoil prepared with great care: when replanted, it is kept continually weeding, the ſtem frequently cleanſed, and the loweſt leaves and the ſuckers it puts forth, taken off, that ten or fifteen of the fineſt leaves may have all the nouriſhment.

The leaves thus reſerved being ripe, which is known by their breaking when bent, the ſtalks are cut, and left to dry two or three hours in the ſun; after which they are tied two by two, and hung up on ropes under a ſhed to be dried by the air. When the leaves are ſufficiently dried, they are pulled from off the ſtalks, and made up in little bundles; which being ſteeped in ſea-water, or for want thereof, in common water, are twiſted in manner of ropes, and the twiſts formed into rolls, by winding them with a kind of mill around a ſtick.—In which condition it is imported into Europe, where it is cut by the tobacconiſts for ſmoaking, formed into ſnuff, and the like.

Beſides the *tobacco* of the Weſt-Indies, there are conſiderable quantities cultivated in the Levant, the coaſts of Greece and the Archipelago, the iſland of Malta and Italy.—The marks of good twiſt *tobacco*, are a fine ſhining cut, an agreeable ſmell, and that it have been well kept.

Tobacco is either taken by way of ſnuff, as a ſternutatory, or as a maſticatory by chewing it in the mouth, or by ſmoaking it in a pipe. See PIPE, STERNUTATORY, MASTICATORY, FUMIGATION, *&c.*

It is ſometimes alſo taken in little longiſh pellets put up the noſe, where it is found to produce very good effects, to attract a deal of water or pituita, unload the head, reſolve catarrhs, and make a free reſpiration; for the ſubtile parts of the *tobacco* in inſpiration are carried into the trachea and lungs, where they looſen the peccant humours adhering thereto, and promote expectoration.

Some have left this *tobacco* in their noſes all night; but this is found to occaſion vomiting the morrow morning. Another thing charged on this way of application, is, that it weakens the ſight.

Tobacco is held a firſt rate narcotic. See NARCOTIC, and OPIATE.—When taken in great quantities in the way of ſnuff, it is found to prejudice the ſmelling, greatly diminiſhes the appetite, and in time gives riſe to a phthiſis.

That taken in the way of ſmoak, dries and damages the brain. Borrhi, in a letter to Bartholine, mentions a perſon who through exceſs of ſmoaking had dried his brain to that degree, that after his death there was nothing found in his ſkull but a little black lump, conſiſting of mere membranes.

Some people uſe the infuſion of *tobacco* as an emetic; but it is a very dangerous and unjuſtifiable practice, and often produces violent vomitings, ſickneſs and ſtupidity.

Bates and Fuller give ſome receipts, in which *tobacco* is an ingredient, with mighty encomiums in aſthmatic caſes.—A ſtrong decoction of *tobacco*, with proper carminatives and cathartics, given clyſter-wiſe, ſometimes proves of good effect in what is uſually called the *ſtone colic*, and alſo in the iliac paſſion. See COLIC, and ILIAC *Paſſion.*

A drop or two of the chymical oil of *tobacco* being put on the tongue of a cat, produces violent convulſions, and death itſelf in the ſpace of a minute; yet the ſame oil uſed in lint, and applied to the teeth, has been of ſervice in the tooth-ach; though it muſt be to thoſe that have been uſed to the taking of *tobacco*, otherwiſe great ſickneſs, retchings, vomitings, *&c.* happens; and even in no caſe is the internal uſe of it warranted by ordinary practice.

A ſtrong decoction of the ſtalks, with ſharp-pointed dock and allom, is ſaid to be of good ſervice, uſed externally, in cutaneous diſtempers, eſpecially the itch: ſome boil them for that purpoſe in urine. The ſame is ſaid to be infallible in curing the mange in dogs.

Sig. Pauli, phyſician to the king of Denmark, in an expreſs treatiſe on *tobacco*, obſerves that the merchants frequently lay it in bog-houſes, to the end that becoming impregnated with the volatile ſalt of the excrements, it may be rendered the briſker, more fœtid and ſtronger.

Amurath IV. emperor of the Turks, the grand duke of Muſcovy, and the emperor of Perſia, have prohibited the uſe of *tobacco* in their ſtates.—Our king James I. wrote a treatiſe expreſs againſt it, intitled, *A counter-blaſt to tobacco.* By a bull of pope Urban VIII. ſuch are excommunicated as take *tobacco* in churches.

TOD *of Wool* is mentioned in the ſtatute 12 Car. II. c. 32. as a weight containing 28 pounds, or two ſtone. See STONE, WOOL, *&c.*

Some will have the word derived from the French, *toilet*, a *wrapper*, within which, by uſage, two ſtone of wool is folded.

TOES, by anatomiſts called *digiti pedis*, are the extreme diviſions of the feet; anſwering to the fingers of the hand. See FOOT.

The *toes* of each foot conſiſt of 14 bones; the great *toe* having two, and the reſt three each; they are like the bones of the fingers, but ſhorter. See FINGER.

In the *toes* are found twelve oſſa ſeſamoidea, as in the fingers. See SESAMOIDEA.—The gout chiefly ſeizes the great *toe*. See GOUT.

TOFT, TOFTUM, or TOFTA, in our law-books, a parcel of land, or a place where a meſſuage hath ſtood, but is decayed, or caſually burnt, and not re-edified.

TOGA, in antiquity, a wide woollen gown, or mantle, without ſleeves, uſed among the Romans, both by men and women.

In proceſs of time, none wore the *toga* but lewd women, whence that of Horace.—*In matrona, peccesve togata.*

The *toga* was of divers colours, and admitted of various ornaments: there was that called *toga domeſtica*, wore within-doors; *toga forenſis*, wore abroad; *toga militaris*, uſed by ſoldiers, tucked up after the Gabinian faſhion; and *toga picta*, or *triumphalis*, wherein the victorious triumphed, embroidered with palms: that without any ornaments, was called *toga pura*.

The *toga* was ſometimes wore open, called *aperta*; ſometimes girt or tucked up, called *præcincta*; and this cincture or girding again, according to Sigonius, was of three kinds; *laxior*, or the looſe kind, where the tail trailed on the ground; *adſtrictior*, the cloſe kind, wherein it did not reach ſo low as the feet; and *Gabinia*, where one of the ſkirts or lappets was girt round the body.

Sigonius diſtinguiſhes the ſeveral *togæ*, or Roman gowns, into *pura*, *candida*, *pulla*, *picta*, *prætexta*, *trabea*, and *paludamentum*. See PRÆTEXTA, PALUDAMENTUM, *&c.*—The *toga pura* was alſo called *virilis*. See VIRILE.

Jus **TOGÆ**, or privilege of the *toga*, was the ſame with the privilege of a Roman citizen, *i. e.* the right of wearing a Roman habit, and of taking, as they explain it, fire and water through the Roman empire. See CITIZEN.

TOILES, ſnares, or nets ſet by hunters for catching of wild beaſts; as deer, *&c.*

TOILET, a fine cloth, of linnen, ſilk, or tapeſtry, ſpread over the table in a bed-chamber, or dreſſing-room, to undreſs and dreſs upon.

The dreſſing-box, wherein are kept the paints, pomatums, eſſences, patches, *&c.* the pin-cuſhion, powder-box, bruſhes, *&c.* are eſteemed parts of the equipage of a lady's *toilet*.

That of the men conſiſts of a comb-caſe, bruſhes, *&c.* To make a viſit to one at his *toilet*, is to come to entertain him while he is dreſſing or undreſſing.

Sattin, velvet, brocade, point de France, *&c.* are now ordinarily uſed for *toilets:* anciently they were made much plainer, whence the name, which is formed from the French, *toilette*, a diminutive of *toile*, any thin ſtuff.

TOISE, a French meaſure, containing ſix of their feet, or a fathom. See FATHOM, and MEASURE.

TOISON *d'Or*, a term in heraldry for a golden fleece, which is ſometimes borne in a coat of arms. See GOLDEN *Fleece*.

TOL, in law, a term ſignifying to defeat, or take away.—From the Latin, *tollere*, which ſignifies the ſame.

Thus, to *tol the entry*, is to take away the right of entry. See ENTRY.

TOL-BOOTH, or TOLL-BOOTH, a place in a city, where goods are weighed, to aſcertain the duties or imports thereon.

TOLERATION, in religion, a term which has made a great figure in the diſputes among proteſtants, who have been exceedingly divided about the meaſures of *toleration*, or the degrees to which heretics and ſchiſmatics are, or are not to be ſuffered. See PERSECUTION.

Many of the church of England have zealouſly oppoſed the *toleration* of preſbytery, *&c.* nor has the church of Scotland been behind-hand with them in their zeal againſt epiſcopacy.*

But all who have reaſoned conſiſtently from the principles of the reformation, have been for *toleration*; as well perceiving they had no right to oblige any body to follow their particular ſentiments: but the difficulty is, the ſetting bounds to this *toleration*. See LIBERTY *of Conſcience*.

M. Baſnage and ſome others diſtinguiſh *civil toleration* from *eccleſiaſtical*.—The latter allows of different, and even oppoſite ſentiments in the church, and the firſt permits them in civil ſociety.

By *civil toleration* is meant impunity and ſafety in the ſtate for every ſect which does not maintain any doctrine inconſiſtent with the peace and welfare of the ſtate.—This civil or political *toleration* implies a right of enjoying the benefit of the laws, and of all the privileges of the ſociety, without any regard to difference of religion.

---

* When a bill was brought into parliament for the toleration of all proteſtants in the exerciſe of religious worſhip; the general aſſembly of the kirk did moſt humbly beſeech; yea, they were bold in the Lord, and in the name of the church of God, earneſtly to obteſt his grace [the lord high commiſſioner] and the moſt honourable eſtates, that no ſuch motion of any legal toleration to thoſe of the prelatical principles might be entertained by the parliament. See *Life of Qu. Anne*, p. 95.

Eccleſiaſtical toleration, is an allowance of certain opinions, which not being fundamentals, do not hinder thoſe who profeſs them from being eſteemed members of the church.—But as to the quality and number of theſe fundamental points, they never could, nor in all probability ever will, be agreed upon.

TOLL, TELONIUM, a Saxon term, though derived originally from the Latin *tollere, to take away*, or rather the Greek τελ@, *tribute, tax*.—It has two acceptations, denoting, 1°. a liberty to buy and ſell within the bounds of a manour.

TOLL is alſo uſed for a tax or cuſtom paid for paſſage, or for vending goods in a market, fair, or the like. See PASSAGE, FAIR, *&c.*

Some records make mention of *toll thoro*, or *thorough toll*, which is money paid for paſſage in or through ſome highways, or over ferries, bridges, *&c.*—*Toll travers*, for paſſing or driving cattle over a private man's ground.—*Toll-turn*, or *turn-toll*, paid at the return of beaſts from fairs and markets, though they were not ſold.

By the ancient law, the buyers of corn and cattle in fairs or markets ought to pay *toll* to the lord of the market, in teſtimony of the contract theſe lawfully made in open market, becauſe privy contracts were held unlawful.

Some interpret *toll* a liberty as well to take, as to be free from *toll*; for that they who are enfeoffed with *toll*, are cuſtom free. Of this freedom from *toll*, the city of Coventry boaſts an ancient charter, granted them by Leofrick or Luriche, earl of the Mercians in Edward the Confeſſor's time, who, at the importunity of Godeva his lady, granted this freedom to the city.

TOLLBOOTH, } See the articles { TOLBOOTH,
TOLU *Balſam*, } { BALSAM.

TOMAN, or TOUMAN, a kind of imaginary money uſed among the Perſians in the keeping of their books, and to facilitate the reduction of money in the payment of conſiderable ſums. See MONEY.

The *toman* conſiſts of fifty abaſſi's, or a hundred mamoudi's, or two hundred ſhahees, or ten thouſand dinars, which amount to about three pounds ſix ſhillings eight pence ſterling.

D'Herbelot derives the word from the language of the Moguls, where it ſignifies the number ten thouſand.—Eben Arabſchah ſays, that the word *touman*, when uſed to expreſs a weight, or money, contains ten thouſand ſilver Arab drachma's, called *methkal*; which are a third lighter than the Attic. See DRACHM.

The Moguls, *&c.* frequently uſe *toman* for ten thouſand men; and ſay, *e. gr.* that the city Samarcand contains ſeven *tomans* of people fit to bear arms; and that of Andekhan nine *tomans*.

TOMB,* includes both the grave or ſepulchre, wherein a defunct is interred; and the monument erected to preſerve his memory. See SEPULCHRE, and MONUMENT.

* The word is formed from the Greek, τυμβ@, *tumulus, ſepulchre*; or according to Menage, from the Latin, *tumba*, which ſignifies the ſame.

Among the Romans none but the emperors, veſtals, and perſons ſignalized by great actions, were allowed to have *tombs* in the cities; the reſt were all in the country, near the highroads; whence thoſe common words, *ſiſte, & abi, viator*; which are ſtill retained in the inſcriptions of our monuments in churches, *&c.* though the occaſion be no more. See EPITAPH, INSCRIPTION, *&c.*

At Anchiale was anciently ſeen the *tomb* of Sardanapalus, with this inſcription in verſe: *Sardanapalus built Anchiale and Tarſus in one day: go, paſſenger, eat, drink, and be merry; the reſt is nothing.* Vid. Strab. Geog. lib. 14.

The Romans had a kind of empty *tomb*, called *cenotaphium*, an *honorary tomb*, wherein no deceaſed was laid. It was uſed to be built in favour of perſons periſhing at ſea, in remote countries, *&c.* where no ſepulture could be had.

The occaſion hereof was a ſuperſtitious notion, that the ſouls of thoſe whoſe bodies were not buried, wandered an hundred years by the banks of the rivers of hell, before they were admitted to paſs over.—The κενόταφιον being made, the ſame ceremonies were practiſed as at real funerals.

The cenotaphia were inſcribed with the words *ob honorem*, or *memoriæ ſacrum*; whereas other *tombs*, wherein the aſhes were really depoſited, were inſcribed D. M. S. *q. d.* ſacred to the manes.—When the words *tacito omine* were added, it declared the aſhes incloſed therein infamous for ſome crime. See FUNERAL.

Characters on TOMB-*ſtone*. See the article CHARACTER.

TOME, ΤΟΜΟΣ, a bound book, or writing that makes a juſt volume. See BOOK.

All the works of ſuch an author are compiled, and reduced into one, or more *tomes*. There are *tomes* in folio, in quarto, in octavo, duodecimo, *&c.*—The councils printed in the Louvre are in 37 *tomes*. Salmeron has wrote the life of Chriſt in 12 *tomes*. See VOLUME.

TOMENTUM, properly ſignifies flocks, or locks of wool; but by botaniſts is uſed for that ſoft downy matter, which grows on the leaves of ſome plants, hence denominated *tomentoſe*; as, *gramen tomentoſum, carduus tomentoſus, &c.*

M. Winſlow obſerves a kind of *tomentum* in the ſecretory veſſels of the glands; and from this accounts for the ſecretion of the various fluids from the blood. See GLAND, and SECRETION.

TON. See the article TUN.

TOMKIN *and* **TOMPION.** See the article TAMPION.

TONDIN, or TANDINO, in architecture. See TORE.

TONE, or TUNE, in muſic, a property of ſound, whereby it comes under the relation of *grave* and *acute*; or, the degree of elevation any ſound has, from the degree of ſwiftneſs of the vibrations of the parts of the ſonorous body. See SOUND, GRAVITY, *&c.*

For the cauſe, meaſure, degree, difference, *&c.* of *tones*, ſee TUNE.—The variety of *tones* in human voices ariſes partly from the dimenſions of the wind-pipe, which, like a flute, the longer and narrower it is, the ſharper is the *tone* it gives; but principally from the head of the larynx, or knot of the throat; the *tone* of the voice being more or leſs grave, as the rima, or cleft thereof is more or leſs open. See VOICE.

TONE is more particularly uſed in muſic for a certain degree or interval of tune, whereby a ſound may be either raiſed or lowered from one extreme of a concord to the other; ſo as ſtill to produce true melody. See INTERVAL, and CONCORD.

Muſicians, beſide the concords, or harmonical intervals, admit three leſſer kinds of intervals, which are the meaſures and component parts of the greater, and are called *degrees*: the nature, origin, uſe, *&c.* whereof, ſee under the article DEGREE.

Of theſe degrees, two are called *tones*, and the third a *ſemitone*; their ratio's in numbers are 8 : 9, called a *greater tone*; 9 : 10, called a *leſſer tone*; and 15 : 16, a *ſemitone*.

The *tones* ariſe out of the ſimple concords, and are equal to their differences: thus the *greater tone* 8 : 9 is the difference of a fifth and a fourth; the *leſſer tone* 9 : 10 the difference of a leſſer third and fourth, or of a fifth and ſixth greater; and the *ſemitone* 15 : 16 the difference of a greater third and fourth. See SEMITONE.

Of theſe *tones* and *ſemitones* every concord is compounded, and conſequently is reſolvable into a certain number thereof.—Thus the leſſer third conſiſts of one *greater tone* and one *ſemitone*—the greater third of one *greater tone* and one *leſſer tone*. See THIRD.—The fourth of one *greater tone*, one *leſſer tone*, and one *ſemitone*. See FOURTH.—The fifth of two *greater tones*, one *leſſer tone*, and one *ſemitone*. See FIFTH, *&c.*

For the uſe of theſe *tones*, &c. in the conſtruction of the ſcale of muſic, ſee SCALE.

Diazeuctic TONE. See the article DIAZEUCTIC.

TONGUE, *Lingua*, in anatomy, an oblong member, whoſe form and ſituation are ſufficiently known, and whoſe uſe is to be the organ of taſte, and the principal inſtrument of ſpeech and deglutition. See SPEECH, *&c.*

It is faſtened to the os hyoides, the larynx, and to the fauces, by means of a membranous ligament running along the lower ſide of it, about half way, called the *frænum*. See OS HYOIDES, *&c.*

The main bulk and body of the *tongue* is made up of muſcles, which are covered on the upper part with a papillary nervous ſubſtance, over which are ſpread two membranes.—The outer of theſe membranes is pretty thick and ſhort, and full of papillæ, of a pyramidal figure, eſpecially towards the tip; which papillæ ſtand pointing towards the root of the *tongue* in a bending poſture, which makes their figure to be concavo-convex. Theſe apices, or papillæ are ſo very minute and ſlender in men, that they make the coat appear on the upper part to be villous, eſpecially as they approach nearer to the root. The figure of the papillæ, in human *tongues*, is not ſo plainly diſcernable to the naked eye as not to need the microſcope. In brutes they are generally larger, ſtiffer, and more conſpicuous; and in ſome almoſt cartilaginous, as may be felt in the *tongues* of cats, oxen, but more ſenſibly in lions. On the upper ſide, at a little diſtance from the tip, this membrane becomes thin, ſmooth, and glabrous, and as it were, poliſhed by the lower parts of the mouth whereon it ſlides.

Under this lies a thin, ſoft, reticular kind of coat, punched through with innumerable holes, and always lined with a thick and white yellowiſh mucus. This membrane is ſo exceeding tender, and full of mucus, that it is not to be examined by the naked eye, unleſs boiled: by which it grows tough, and eaſily ſeparable from the external membrane, and from the nervous part of the *tongue* which lies immediately under it. After boiling, it appears like a kind of gawſe, between whoſe threads innumerable holes appear, through which the apices of the papillary body underneath it are exerted. This membrane on the upper ſide, next the outward, appears white, with a caſt towards yellow, but black on the ſide next the *tongue*.

Many authors do not allow this to be a membrane, and will only have it to be a mucus hardened by boiling; but ſince it has ſo much of the reſemblance of a membrane, and that authors agree in allowing two membranes to the *tongue*, Dr. Drake does not ſcruple to number it among them; ſince there does not appear to be any other ſecond membrane: reckoning with Malpighi, the ſmooth part under the *tongue* a part of the outer membrane.

Immediately under this appears a nervous papillary body ſpreading itſelf to a pretty thickneſs over the whole ſurface of the *tongue*. This body, on the under ſide, is every where level and ſmooth, except in ſome few places, where it is connected to the ſubjacent muſculous part by ſome nervous twigs which it ſends into it.—Malpighi diſtinguiſhes the papillæ, which make the principal part hereof, into three kinds, from their different magnitudes and figures when obſerved with the microſcope; of which, thoſe ſeated on the ſides and tip are very ſingular, reſembling little round pyramids, with globes on their tips like the horns of ſnails.—All theſe papillæ, which are the immediate organs of taſting, ſend their apices, or extremities, through the mucous membrane, into the pyramidal papillæ of the outer membrane, which are hollow to receive them, and ſeem to be nothing elſe but a kind of caſes to defend theſe nervous papillæ from injuries, which the ſalts and aſperities of thoſe bodies which we take into our mouths, might do them. See Papilla, Tasting, &c.

The reſt, and much the greateſt part, of the body of the *tongue* is muſculous, conſiſting of plans of fibres in different directions: the firſt, or external plan, conſiſts of ſtrait fibres, which cover the *tongue* from one extreme to the other; when theſe contract, they ſhorten it. Under this are ſeveral other plans, running from the under to the upper ſide, which ſerve to make it broad and thin. Theſe two kinds of fibres lie *ſtratum ſuper ſtratum*, a plate of the one, and then a plate of the other.

Authors are not agreed about the number of muſcles which compoſe the *tongue*: ſome confounding thoſe of the os hyoides with thoſe of the *tongue*, reckon eight, others nine, others ten, and more pair. Some number thoſe proper to the *tongue* alone ſix pair, others five, others four, and ſome no more than three. Of this laſt opinion is our accurate Mr. Cowper, who allows no more than three genuine pair of muſcles to the *tongue*, viz. the pair *genioglossum*, which pull the *tongue* forwards, and put it out of the mouth; the *ceratogloſſum*, which draws it into the mouth, or pulls it on one ſide; and the *ſtylogloſſum*, which draws the *tongue* up in the action of deglutition. See Genioglossum, Ceratoglossum, &c.

Beſides the muſcles, the *tongue* is alſo moved by a bone ſituated at its root, and making as it were its baſis, called *os hyoides*. See Hyoides.

Down the middle of the *tongue*, lengthwiſe, runs a ſeam, called *linea mediana*, which divides it to the bottom into two equal parts, but not ſo effectually but that the blood veſſels of one ſide communicate with thoſe of the other.—Theſe veſſels are arteries from the carotides and veins called *ranulæ*, and are very conſpicuous about the frænum under the tongue, ſerving to reconvey the blood to the external jugulars. Theſe veins are frequently opened in the angina, and are the laſt reſort of old women in this caſe.—The nerves of the *tongue* come from the fifth, ſixth, and ninth pairs; the two firſt of which have been called *guſtatorii*, and the latter *motorii linguæ*. See Nerve.

Howſoever neceſſary an organ the *tongue* be in ſpeech, &c. yet Jac. Rolandus has publiſhed an account of a mouth without a *tongue*, which ſpake perfectly, and performed its other natural functions; the perſon he ſpeaks of is Pet. Durand, who loſing his *tongue* by a gangreen, could yet ſpeak perfectly, as alſo taſte, ſwallow, and chew his food; which laſt, however, he could only do on that ſide he put it into, being unable to turn it to the other ſide of his mouth.

Tongue-*tied*, } { Ranula.

TONIC,* τονικος, in medicine, is applied to a certain motion of the muſcles, wherein the fibres being extended, continue their extenſion in ſuch manner, as that the part ſeems immoveable, though in reality it be in motion. See Muscle.

* The word is formed from the Greek, τεινειν, *to ſtretch*.

Such is the caſe of a man ſtanding, of birds planing or ſwimming through the air, &c.—Galen ſays, that the muſcles act even when at reſt; for after having made any contraction to fix themſelves in a certain ſtate or diſpoſition, the preſerving of that contraction is what we call the *tonic motion*.

TONICAL *Echo*. See the article Echo.

TONNAGE, } { Tunnage,
Duty of Tonnage, } See the articles { Duty,
TONNING, } { Tunning.

TONSILS, Tonsillæ, in anatomy, two round glands, ſituate near the root of the tongue, on each ſide the uvula, under the common membrane of the fauces, with which they are covered: called alſo *amygdalæ*, or *almonds of the ears*. See Almonds.

TONSURE,* the art or act of cutting the hair, and ſhaving the head. See Hair.

* The word is formed from the Latin, *tondere*, *to ſhave*.

The *tonſure* was anciently a mark of infamy in France; inſomuch, that when they would render any prince incapable of ſucceeding to the crown, they cut off his hair, and ſhaved him. See further under the article Beard.

Tonsure, in the Romiſh church, is uſed for the entrance, or admiſſion into holy orders. See Orders.

In propriety, *tonſure* is the firſt ceremony uſed for devoting a perſon to God and the church, by preſenting him to the biſhop, who gives him the firſt degree of the clericate, by cutting off part of his hair, with certain prayers and benedictions. Some hold the *tonſure* a particular order; others, as Loyſeau, only the mark and form of eccleſiaſtical orders in general. The *tonſure* ſuffices to make a clerc: the reſt is only to qualify him for the holding benefices.—A perſon is capable of the *tonſure* at ſeven years of age; hence a benefice of ſimple *tonſure* is ſuch a one as may be enjoyed by a child of ſeven years old. The *tonſure* is the baſis of all the other orders.

Tonsure is particularly uſed for the corona, which prieſts, &c. wear, as the mark of their order, and of the rank they hold in the church. See Crown.

The barbers have the meaſures and dimenſions of the different kinds of *tonſures*, or clerical crowns; to be practiſed according to the different degrees and orders.—A clerc's *tonſure*, a ſub-deacon's *tonſure*, a deacon's *tonſure*, a prieſt's *tonſure*, are each ſucceſſively bigger than other.

TOOLS, ſimple and popular inſtruments, uſed in the more obvious operations; and particularly in the making of other more complex inſtruments. See Instrument.

Tools are divided into *edge-tools*, *ſpring-tools*, *pointed-tools*, &c. See Steel, and Tempering.

TOOTH, *Dens*, in anatomy, a little, hard, ſmooth bone, ſet in the gums, and ſerving to maſticate or chew the food, to bite, &c.—See *Tab. Anat.* (Oſteol.) *fig.* 2. *lit. d, e, f.* See alſo the articles Food, Mastication, &c.

Men, and moſt terreſtrial animals, as alſo ſome fiſhes, have two rows of *teeth*, the one in the upper jaw, and the other in the lower. See Gum, and Maxilla.

In men, the ordinary number of *teeth* is 32; ſixteen in each jaw; all fixed in peculiar ſockets, called *alveoli*, by the juncture or articulation called *gomphoſis*, and by the joiners, *pegging*. See Gomphosis.

They are of three ſorts: thoſe in the fore-part of each jaw are called *inciſores*, *cutters*; and are four in number in each jaw, broad, thin, and flat: ſome call them the *primores*, becauſe they appear the firſt; others the *adverſi*; and others the *ridentes*, *laughers*, becauſe they ſhew themſelves firſt in laughing. See Incisivi.

Behind theſe, on each ſide of each jaw, ſtand two which are a little more prominent, and pointed, called *canini*, by the people *eye-teeth*, becauſe part of the nerve which moves the eyes is inſerted into them, whence the danger of pulling them out. See Canine.

Behind theſe are five in each jaw, called the *molares*, or *grinders*, being thoſe which in men ſerve chiefly for maſtication. See Molares.

The inciſores have generally only a ſingle root, or twang; the canini ſometimes two; and the molares three or four, eſpecially the hind ones, which are put to the greateſt ſtreſs.

The *teeth*, according to Peyer, are formed of convolved ſkins, hardened and bound together by a viſcid mucus: and if we view the grinders of deer, horſes, and ſheep, &c. we ſhall find great reaſon to be of his mind.

Others ſpeak of their formation otherwiſe. The ſockets, Dr. Quincy obſerves, are lined with a thin membrane, upon which are ſeveral veſſels, through which there paſſes a thick tranſparent humour, that, as it increaſes, hardens in form of *teeth*; and about the ſeventh or eighth month after birth, they begin to pierce the edge of the jaw, tear the perioſteum and gums, which being very ſenſible, create a violent pain, and other ſymptoms incident to children in the time of dentition. See Dentition.

The *teeth* begin not to appear all at a time; but firſt the dentes inciſivi of the upper, and then thoſe of the lower jaw appear, becauſe the thinneſt and ſharpeſt; after them come out the canini, becauſe they are ſharper than the molares, but thicker than the inciſivi; and laſt of all the molares, becauſe they are thickeſt and blunteſt.

Of this viſcous tranſparent liquor, which is indurated into the ſubſtance of the *teeth*, there are two lays, one below the other, divided by the ſame membrane which covers all the cavity of the jaw: the uppermoſt lay forms the *teeth* which come out firſt; but about the ſeventh year of age they are thruſt out by the *teeth* made of the undermoſt lay, which then begin to ſprout; and if theſe *teeth* be loſt, they never grow again.

If ſome have been obſerved to ſhed their *teeth* twice, they have had three lays of this viſcous humour, which hardly ever happens.

About the one and twentieth year, the two laſt of the molares ſpring up, and are called *dentes ſapientiæ*, becauſe they ariſe when the perſon is at years of diſcretion. See Sapientiæ.

The *teeth*, M. de la Hire the younger has found to have all that part which ſtands out beyond the jaw, covered with a peculiar ſubſtance called *enamel*, quite different from the reſt of the bone.

This enamel, by ſome others called the *perioſteum*, is compoſed of an infinity of little fibres, which grow to the bone by their roots, much like nails or horns. See Nail.

This compoſition is very diſcernable in a broken *tooth*, where the origin and ſituation of the fibres are apparent. M. de la Hire is perſuaded, that the growth of theſe fibres is performed much like that of nails. If by any accident a little part of this enamel be broke of, ſo that the bone is left bare, that is, if the very roots of the fibres be taken away, the bone, in that part, will grow carious, and the *tooth* inevitably periſh; there being no bone in the body that can bear the air. See BONE. Indeed, in ſome perſons the enamel is very much wore and ſhattered, by rubbing them much with dentrifices, &c. ſo that the bone appears through, and yet the *tooth* keeps ſound; but the reaſon is, that the bone is not quite bare, but there is ſtill a thin lay of the enamel which preſerves it; but this lay being thin enough to be tranſparent, the yellow bone is ſeen through it.

Sometimes alſo a *tooth* breaks, and the bone is left bare, yet the perſon does not find any pain or aking from it: the reaſon is, that the hole in the root or twang of the *tooth*, through which a little branch of a nerve enters that renders the *tooth* ſenſible, being quite ſtopped up by age, or the like, has pinched off the nerve, and taken away all communication between the *tooth* and the origin of the nerves, and, by conſequence, all ſenſibility.

It alſo happens in ſome *teeth*, that the fibres are only in little ſheaves, or bundles, whoſe upper extremities meet, but not their lower; as is the caſe in moſt of the grinders, where the ſeparation of the bundles is apparent. Here, if the upper extreme of the fibres chance to be broken, or wore off, the ſeparation between two of the bundles often enlarges itſelf, ſo as to admit ſome hard particle of the food, by which means a little aperture being made through the enamel, the bone is laid bare, and the *tooth* ſoon rots. This inconvenience is remedied a little by ſtopping up the hole with lead, which prevents the ſharp pungent parts of the food from penetrating to the bone, and there occaſioning pain. See ODONTALGY.

What we have ſaid is illuſtrated by the figures in *Tab. Anat.* (Oſteol.) *fig.* 14. where ACFH expreſſes the extremity of the jaw the *teeth* are ſet in; AEC and FGH the roots or twangs of the *teeth* incloſed in the jaw; ADCB and FLHII the enamel, compoſed of little fibres ranged aſide of each other, which cover all that part of the *tooth* without ſide the jaw; II ſeveral threads joined at the upper extremity, but apart at the lower; MM holes through which the nerves enter the roots of the *teeth*; NN a *tooth* cloſed up.

The *teeth*, Mr. Derham obſerves, furniſh us with a notable inſtance of the wiſdom and goodneſs of the Creator: their peculiar hardneſs is very remarkable, conſidering the tender ſubſtance they are formed of. See BONE.

The ancients, and even Riolanus, among the moderns, have held them to be incombuſtible, and the only part of the body that was ſo; on which account they were placed with great care in the urns among the aſhes of the deceaſed: but the opinion is falſe, there having only been two found in the tombs of Weſtphalia, one of which was half calcined.

Another popular error is, that the *teeth* continue growing for ever, even in old people, to the hour of their death. M. de la Hire obſerves, it is only the enamel or poliſh that grows, which is a ſubſtance very different from the *teeth*.

The form, diſpoſition, and order of the *teeth*, are admirable: the foremoſt are weak and far from the centre, as being only preparers to the reſt; the others being to grind and mince, are accordingly ſtronger, and placed near the centre of motion.

Galen puts the caſe, that the order of the *teeth* ſhould have been inverted, and the grinders, *e. gr.* put in the place of the inciſores; and aſks, what uſe the *teeth* had then been of, and what confuſion would not there have aroſe by ſuch a ſlight overſight in the diſpoſal only? Upon which he argues, that if any perſon ſhould diſpoſe a company of 32 men, the number of the *teeth*, in a juſt order, we ſhould judge him an intelligent perſon: why then ſhould we not judge the ſame of the Creator, &c? *De uſu partium.*

Again, their various forms, in various animals, is no leſs conſiderable, being all curiouſly adapted to the peculiar food and occaſions of the ſeveral ſpecies of animals: thus in the rapacious they are fitted for the catching, holding, and tearing the prey; in herbaceous for the gathering and comminution of vegetables; and in ſuch as have no *teeth*, as birds, the bill ſupplies the defect.

Add, that the temporary defect of them is no leſs obſervable in ſome: that children, for inſtance, ſhould have none while they are not able to uſe them, but to hurt themſelves, or the mother; and that at the very age when they can take in the more ſubſtantial food, and live without the breaſt, and begin to need *teeth* for the ſake of ſpeech; that then, we ſay, their *teeth* ſhould begin to appear, and gradually grow as they more and more ſtand in need of them.

Some perſons are born with all their *teeth*, as Marcus Curius Dentatus, and Cneius Papirius Carbo: others have only had one continued *tooth*, reaching the whole length of the jaw, as Pyrrhus king of Epirus, and Pruſias ſon of the king of Bithynia: others are ſaid to have had two or three rows on the ſame jaw, as Hercules.

Mentzelius, a German phyſician, aſſures us, that he ſaw an old man at Cleves, in 1666, aged 120 years, who had a new ſet of *teeth* two years before, which cut with great pain; and he ſaw an Engliſhman at the Hague, who cut a new ſet of *teeth* in his 118th year.

A Daniſh phyſician, named Hagerup, maintains in certain theſes, that one may hear with the *teeth*. See HEARING.

As to animals, there are ſome fiſhes have *teeth* on their tongues, as trouts; others have them at the bottom of their gullet, as the cod-fiſh; ſome, as the great ſea-dog, called *canis carcharias*, have three, four, or five rows of *teeth* on the ſame jaw; the requiem and crocodile have each three, and thoſe all inciſors; vipers have two large crooked canine *teeth*, which are moveable, and ordinarily lie flat, only raiſed when they would bite. See VIPER, &c. And the ſea-frog, or ſea-devil, has whole rows of the like moveable *teeth*.—The toad and cuttle-fiſh have no *teeth*, and yet bite.

Artificial TEETH, are thoſe ſet in lieu of natural ones which are wanting.—They are uſually made of ivory; but in regard ivory, in a little time, grows yellow in the mouth, Fabricius adviſes them to be made of the ſhin-bone of a bullock, which preſerves its colour.

The cuſtom of wearing ivory *teeth*, and of binding them in with a gold wire, is very ancient: Lucian and Martial ſpeak of it as practiſed among the Romans.

Guillemeau gives us the compoſition of a paſte for making *artificial teeth*, which ſhall never grow yellow: the compoſition is white wax granulated, and melted with a little gum elemi, adding powder of white maſtic, coral, and pearl.

TOOTH *in the manage.*—It is by a horſe's *teeth*, chiefly, that his age is known. See HORSE, and AGE.

The *teeth* of a horſe are of four kinds, *viz.* 24 *jaw-teeth*, or *grinders*, at the bottom of the mouth, beyond the bars; 12 on each ſide the channel, ranged ſix above, and as many below.—Theſe never fall, nor are they uſed for the diſtinction of age.

Twelve *foal-teeth*, or *milk-teeth*, which come in the fore-part of the mouth at three months old, and are uſually caſt at two years and half.

Four *tuſhes*, placed alone in the bars between the fore-*teeth* and grinders, one on each ſide below, and as many above. Mares ſeldom have tuſhes, and when they have, they are ſmall, and are reckoned an imperfection.

Twelve *gatherers*, growing before in the place of the foal-*teeth* and grinders, and with which horſes draw their fodder, cut graſs, &c. Theſe are divided into

Nippers, which are the two foremoſt *teeth* above, and as many below, which a horſe firſt changes.

Middle teeth, or *ſeparaters*, parting the nippers from the corner *teeth*, are the two next the nippers, one on each ſide of them, both above and below, and are thoſe which change next.

Outward, or *corner teeth*, are thoſe next the tuſhes above and below, and which are caſt laſt.—They ſhoot forth from the gum at five years of age, and have a hollow, wherein is a black ſpeck, reſembling a bean, called the *mark*, which continues till ſeven or eight years of age, and then begins to fill up. See MARK.

TOOTH-ACH, a popular diſeaſe, by phyſicians called *odontalgy*. See ODONTALGY.

The *tooth-ach* uſually proceeds from a caries which rots the bone, and eats it hollow. For the cauſes, &c. of this caries, ſee TOOTH.

Sometimes it proceeds from a defluxion of a ſharp matter upon the gums.—For the *tooth-ach*, a paſt made of ſoft bread, and the ſeed of ſtramonium, laid on the tooth affected, abates the pain; if the tooth be hollow, and the pain great, a compoſition of equal quantities of opium, myrrh, and camphire, made up in a paſte with brandy or ſpirits of wine, and about a grain or two put into the hollow place, puts a ſtop to the caries, and blunts the acute pain of the nerve; by which it often gives immediate relief.

Chymical oils, as thoſe of origanum, cloves, tobacco, &c. are alſo of ſervice, deſtroying, by their hot cauſtic nature, the texture of the ſenſible veſſels of the tooth affected; though, from too liberal an uſe of them, frequently proceeds a defluxion of humours, and impoſtumation.

A bliſter applied behind one or both ears ſeldom fails to cure the *tooth-ach*, eſpecially when attended with a hot defluxion of humours, and ſwelling of the gums, face, &c. Liniments of ointment of marſhmallows, alder, &c. mixed with rum, brandy, or ſpirit of wine camphorated, are good, uſed outwardly, to abate the ſwelling.

Mr. Cheſelden mentions one cured of the *tooth-ach* by applying a ſmall cauterizing iron to the anthelix of the ear, after he had undergone bleeding, purging, ſalivation, ſetons, &c. to no purpoſe: the caſe was very remarkable; for when he was ſeized with it, a convulſion of that whole ſide of his face followed, whenever the pain became acute, or he attempted to ſpeak.

Scoockius, in his treatiſe of butter, maintains, that there is no better means of keeping the teeth fair and ſound, than by rubbing them over with butter: an opiate not much leſs diſtaſte-ful than that of the Spaniards, who waſh their teeth every morning with urine.

To prevent and cure the ſcurvy in the gums, it is recommended to waſh the mouth every morning with ſalt and water; and to hinder the teeth from ſpoiling or growing carious, ſome uſe only powder of hartſhorn to rub the teeth with, and then waſh the mouth with cold water: it is alledged, this is preferable to other dentifrices, on this account, becauſe their hard particles are apt to abrade that fine ſmooth poliſh, with which the ſurface of the teeth is covered, and which is their preſervative from the ill effects of air, aliment, liquors, *&c.* which occaſion ailments of the teeth when wore off.

Dentifrices are uſually compounded of powders of hartſhorn, red coral, bone of the cuttle-fiſh, burnt alum, myrrh, dragon's blood, *&c.* Some commend powder of bricks, as ſufficient to anſwer all the intentions of a good dentifrice. See DENTIFRICE.

TOP-*gallant*,	See the articles	FORE-*top-gallant*,
TOP-*maſt*,		FORE-*top-maſt*,
Heave out TOP-*ſails*,		HEAVE.

TOPARCHY,* a little ſtate, or ſignory; conſiſting only of a few cities, or towns; or a petty country governed and poſſeſſed by a *toparch*, or lord.

* The word is formed from the Greek, τοπος, *place*, and αρχη, *command, government.*

Judæa was anciently divided into ten *toparchies.* See Pliny, *lib.* 5. *c.* 14. and Joſeph. *lib.* 3. *c.* 2. *de Bel. Jud. & lib.* 5. *&c.*—The laſt mentioned author calls the cities of Azotus, Jamna, and Phaſaelis, which Herod left by teſtament to his ſiſter Saloma, a *toparchy.*

Procopius only gives the quality of *toparchy* to the kingdom of Edeſſa; to Abgarus, the *toparch* or lord whereof there is a tradition, that Jeſus Chriſt ſent his picture, with a letter.

TOPAZ, a ſort of gem or precious ſtone; the third in order after the diamond. See GEM, and PRECIOUS *Stone.*

The *topaz* is tranſparent; its colour, a beautiful yellow, or gold colour: it is very hard, and takes a fine poliſh.—It is the true chryſolite of the ancients, and is found in ſeveral parts of the Indies, in Ethiopia, Arabia, Peru, and Bohemia. See CHRYSOLITE.

The oriental *topazes* are moſt eſteemed; their colour borders on the orange: thoſe of Peru are ſofter, but their colour much the ſame: the yellow of thoſe of Bohemia is a little blackiſh; they are the ſofteſt of all, and their poliſh the coarſeſt. Thoſe of Madagaſcar were in much eſteem, but are now held good for little.

Tavernier mentions a *topaz*, in the poſſeſſion of the great Mogul, weighing 157 carats, which coſt 20,300 *l.* ſterling: and Boetius de Boot, in his treatiſe of precious ſtones, affirms to have ſeen in the cabinet of the emperor Rudolphus, whoſe phyſician he was, a *topaz* above three foot long, and ſix inches broad. Probably it might be ſome marble a little tranſparent, of a *topaz* colour.

The *topaz* is eaſily counterfeited; and there are factitious ones, which, to the eye, do not come behind the natural ones. If we might believe the ancients, the *topaz* has very notable virtues; but thoſe are now in diſcredit: and yet the *topaz* is of ſome uſe in medicine, reduced into an impalpable powder, and applied in water. See GEM.

Some ſay, it takes its name *topaz* from an iſland in the red ſea of the ſame name, where it was firſt found by Juba, king of Mauritania; but it was known to the Hebrews before, as appears from the 118th pſalm.

TOPHUS, in medicine, a ſtony or chalky concretion in any part of an animal body; as in the bladder, kidneys, *&c.* (ſee STONE) or in the joints, *&c.* See GOUT, NODE, *&c.*

Dr. Rutty, in his treatiſe of the urinary paſſages, takes the ſtone to ariſe from the attraction between volatile ſaline particles: of which particles the ſtone, when viewed with a microſcope, ſeems to be made up: he thinks the fault of theſe aggregates of ſaline particles, ought generally to be ſuppoſed to begin in, or proceed from, the papillæ of the kidneys, and not from the ſediment of urine in the bladder.

The reaſon why wine-drinkers are more ſubject to the ſtone, and other concretions, than malt or water-drinkers, he ſuppoſes to be the volatile and ſaline, or earthy particles contained in the wine in greater quantities than in the ale, *&c.* A calculus, he obſerves, reduced to a caput mortuum, will upon the affuſion of warm water, diſſolve, and intirely mix; but in a ſhort time will again ſettle, and the particles thereof ſo cloſely unite or attract, as that, by repeated affuſions, they cannot be brought again to diſſolve. See LITHONTHRIPTIC.

TOPIC, in rhetoric, a probable argument, drawn from the ſeveral circumſtances and places of a fact, *&c.* See PLACE, *&c.*

TOPICE,* ΤΟΠΙΚΗ, TOPICA, expreſſes the art or manner of inventing and managing all kinds of probable argumentations. See INVENTION.

* The word is formed from the Greek, τοπικος, of τοπος, *place:* its ſubject being the *places*, which Ariſtotle calls the *ſeats* of arguments.

Ariſtotle has wrote *topics*; and Cicero a kind of comment on them, to his friend Trebatius, who, it ſeems, did not underſtand them.—But the critics obſerve, that the *topica* of Cicero agree ſo little with thoſe eight books of *topics* which paſs under the name of Ariſtotle, that it follows neceſſarily, either that Cicero was much miſtaken, which is not very probable, or that the books of *topics* attributed to Ariſtotle, are not wholly his.

Cicero defines *topica*, or *topice*, to be the art of finding arguments, *diſciplina inveniendorum argumentorum.* See ARGUMENT.

Rhetoric is ſometimes divided into two parts: judgment, called alſo *dialectice*; and invention, called *topice.* See RHETORIC.

TOPICS,* or TOPICAL *remedies*, in medicine, are commonly uſed for what we otherwiſe call *external remedies*, i. e. ſuch as are applied outwardly to ſome particular diſeaſed, and painful part. See MEDICINE.

* The word is formed from τοπος, *locus, place.*

Such are plaiſters, cataplaſms, bliſters, unguents, ſalves, collyriums, *&c.* See EMPLASTER, CATAPLASM, UNGUENT, *&c.*

The gout is never cured by *topics:* they may aſſuage the pain for a time; but for a cure, the ſource of the evil muſt be attacked with internals. See GOUT.

TOPOGRAPHY,* a deſcription, or draught of ſome particular place, or ſmall tract of land; as that of a city or town, manour or tenement, field, garden, houſe, caſtle, or the like; ſuch as ſurveyors ſet out in their plots, or make draughts of, for the information and ſatisfaction of the proprietors. See MAP, SURVEYING, *&c.*

* The word is formed from τοπος, *place*, and γραφω, *I deſcribe.*

Topography differs from *chorography*, as a particular from more general; chorography being a deſcription of a country, a dioceſe, province, or the like. See CHOROGRAPHY.

TORCH, *Tæda*, a ſort of luminary; being, properly, a ſtick of fir, or other reſinous and combuſtible matter, as pine, linden, *&c.* more or leſs thick, and long; encompaſſed at one end with ſix wax candles, which being lighted, yield a kind of gloomy brightneſs.

Torches are uſed in ſome church ceremonies, particularly at the proceſſions of the holy ſacrament in the Romiſh church, and at the interrments of the poorer people.

Formerly they were uſed at the funerals of thoſe of the firſt rank; but tapers and flambeaux are now introduced in their ſtead; and frequently alſo called by their name. See FLAMBEAU, and TAPER.

TORCULAR, or TORCULARIS, among chirurgions, a contrivance for ſtopping bleedings in amputations. See AMPUTATION, HÆMORRHAGE, *&c.*

TORCULAR *Herophili*,* in anatomy, a name given to a part in the duplicatures of the dura mater; formed of a concourſe of a branch of the longitudinal ſinus, with the lateral ſinus's. See DURA *Mater*, DUPLICATURE, BRAIN, SINUS, *&c.*

* It has its name *torcular* from its reſembling a preſs, or ſcrew: *Herophili* is added from the diſcoverer's name.

TORE,* TORUS, in architecture, a large round moulding, uſed in the baſes of columns. See BASE.

* Davilier derives the word from the Greek, τορος, a *cable*, whereof it bears ſome reſemblance; or from the Latin, *torus*, a *bed*, as being ſuppoſed to repreſent the edge of a bed or quilt, ſwelled out with the weight of the incumbent column.

The *tore* is alſo called *gros baton*, and *tondin.*—It is the bigneſs that diſtinguiſhes the *torus* from the aſtragal. See ASTRAGAL.

The baſes of Tuſcan and Doric columns have but one *tore*, which is between the plinth and the liſtel.—In the Attic baſe there are two; the upper, which is the ſmaller; and an under, or bigger.—See *Tab. Architect. fig.* 3. *& fig.* 24. *lit. t. & fig.* 26. *lit. h. m.*

TOREUMATOGRAPHY, a Greek term, ſignifying the knowledge, or rather deſcription, of ancient ſculptures, and baſſo-relievo's. See SCULPTURE, BASSO-RELIEVO, ANTIQUE, *&c.*

The invention of *toreumatographia* is owing to Phidias, and its perfection to Polycletes: the Italian gravers have let a great deal of light into the *toreumatographia.*

TOREUTICE,* ΤΟΡΕΥΤΙΚΗ, that part of ſculpture, called *turning.* See SCULPTURE, and TURNING.

* The word is formed of the Greek, τορνος, *lath*, of τορεω, *terebro, perforo.*

TORIES, or TORYS, a party or faction in England, oppoſite to the whigs. See FACTION, PARTY, WHIG, *&c.*

Theſe two celebrated parties, which have ſo long divided our country, will make a conſiderable article in the Engliſh hiſtory, nothing inferior, in many reſpects, to that of the Guelſs and Gibellins.—The diviſion has gone ſo deep, that it is preſumed, no Engliſhman, who has any concern or principles at all, but inclines more to one ſide than the other: for which reaſon, we ſhall borrow our account of them from the mouths of foreigners, who may be ſuppoſed more impartial; and particularly from M. de Cize, a French officer, ſome time in the ſervice of England, who has wrote the *Hiſtory of whigiſm and toriſm*, printed at Leipſic, *anno* 1717; and M. Rapin, whoſe *Diſſertation ſur les wighs & les torys*, printed at the Hague the ſame year, is well known.

During the unhappy war, which brought king Charles I. to the ſcaffold; the adherents of that king were firſt called *cavaliers*, and thoſe of the parliament *round-heads*; which two names were afterwards changed into thoſe of *tories* and *whigs*, on the following occaſion.

A kind of robbers, or banditti in Ireland, who kept on the mountains, or in the iſlands formed by the vaſt bogs of that country, being called *tories*; a name they ſtill bear indifferently with that of rapparees; the kings enemies accuſing him of favouring the rebellion in Ireland, which broke out about that time, gave his partiſans the name of *tories:* and on the other hand the *tories*, to be even with their enemies, who were cloſely leagued with the Scots, gave them the name of *whigs*, which is that given in Scotland to another kind of banditti, or rather fanatics, in that country. See WHIG.

The cavaliers, or *tories*, had then principally in view the political intereſts of the king, the crown, and the church of England: and the round-heads, or whigs, propoſed chiefly the maintaining the rights and intereſts of the people, and of proteſtantiſm. Nor have the two factions yet loſt their firſt views; though their firſt names, *cavalier* and *round-head*, be now entirely diſuſed.

This is the moſt popular account; and yet it is certain the names *whig* and *tory* were but little known till about the middle of the reign of king Charles II. M. de Cize relates, that it was in the year 1678, that the whole nation was firſt obſerved to be divided into *whigs* and *tories*; and that on occaſion of the famous depoſition of Titus Oates, who accuſed the catholics of having conſpired againſt the king and the ſtate.—The appellation *whig* was given to ſuch as believed the plot real; and *tory* to thoſe who held it fictitious.

We ſhould here confine ourſelves to the *tories*; and for what regards the *whigs*, refer to that article; but ſince by comparing and confronting the two parties together, both the one and the other will appear in the ſtronger light, it would be imprudent to ſeparate them: ſo that we rather chuſe to ſay the leſs under the word *whigs*, and refer thence hither.

The factions we are ſpeaking of, may be conſidered either with regard to the *ſtate*, or to *religion*.—The *ſtate tories* are either violent or moderate: the firſt would have the ſovereign to be abſolute in England, as in other countries, and his will to be a law. This party, which is not very numerous, has yet been conſiderable; 1°. On account of its leaders, which have been lords of the firſt rank, and generally miniſters and favourites. 2°. In that being thus in the miniſtry, it engaged the church *tories* to maintain ſtiffly the doctrine of paſſive obedience. 3°. Becauſe the king has uſually thought it his intereſt to ſupport them.

The moderate *tories* would not ſuffer the king to loſe any of his prerogatives; but neither would they ſacrifice thoſe of the people. Theſe, ſays M. Rapin, are true Engliſhmen; have frequently ſaved the ſtate, and will ſave it again whenever it ſhall be in danger, either from the violent *tories*, or from the republican *whigs*.

The *ſtate whigs*, again, are either republican or moderate: the firſt, according to our author, are the remains of the party of the long parliament, who took in hand to change the monarchy into a commonwealth: Theſe make ſo ſlender a figure, that they only ſerve to ſtrengthen the party of the other *whigs*. The *tories* would perſuade the world, that all the *whigs* are of this kind; as the *whigs* would make us believe that all the *tories* are violent.

The moderate *ſtate whigs* are much in the ſame ſentiments as the moderate *tories*; and deſire the government may be maintained on its ancient foundation: all the difference is, that the moderate *tories* lean a little more to the ſide of the king, and the moderate *whigs* to that of the parliament and people. Theſe laſt are in a perpetual motion to prevent the rights of the people from being broke in upon; and have ſometimes taken precautions at the expence of the crown.

Before we conſider our two parties with regard to religion, it muſt be obſerved, that the reformation, as carried on to a greater or leſſer length, divided the Engliſh into epiſcopalians, and preſbyterians or puritans: the firſt contended, that the epiſcopal juriſdiction ſhould be continued on the ſame footing, and the church in the ſame form, as before the reformation: the latter maintained, that all miniſters or prieſts had equal authority; and that the church ought to be governed by preſbyteries, or conſiſtories of prieſts and lay elders. See PRESBYTERIAN, &c.

After long diſputes, the more moderate of each party relaxed a little of their ſtiffneſs, and thus formed two branches of moderate *whigs*, and moderate *tories*, with regard to religion; but there was a much greater number kept to their principles with inconceivable firmneſs: and theſe conſtituted two branches of rigid epiſcopalians and preſbyterians, ſubſiſting to this day; and now comprized under the general names of *whigs* and *tories*; in regard the firſt join the *tories*, and the latter the *whigs*.

From what has been obſerved, we may conclude, that as the names *tory* and *whig* have a regard to two different objects, they are equivocal, and of conſequence ought never to be applied without expreſſing in which ſenſe it is done—for the ſame perſon may be, in the different reſpects, both *whig* and *tory*.

A preſbyterian, for inſtance, who wiſhes the ruin of the church of England, is certainly on that ſcore, of the party of *whigs*; yet if he oppoſe the attempts ſome of his party would make againſt the royal authority, it cannot be denied but he is effectually a *tory*.

After the like manner, the epiſcopalians ought to be eſteemed as *tories* with regard to the church; and yet how many of them are *whigs* with regard to the government?

For the reſt, the general motives that have formed and kept up the two parties, appear, in the main, to be no other than the private motives of particular perſons: ſelf-intereſt is the primum mobile of their actions; ever ſince the riſe of theſe factions, each has ſtruggled earneſtly to get the advantage over the other; inaſmuch as from ſuch ſuperiority accrue places, and honours, and promotions, &c. which the prevailing party diſtributes among its own members, excluſive of the contrary party.

As to the characters commonly attributed to the *whigs* and *tories*; the *tories*, ſays M. Rapin, appear fierce and haughty: they treat the *whigs* with the laſt contempt, and even ſomewhat hardly, when they have the advantage over them: they are very hot and vehement, and proceed with a rapidity which yet is not always the effect of heat and tranſport, but has its foundation ſometimes in good policy: they are very ſubject to change their principles, as their party prevails, or gives way.

If the rigid preſbyterians prevailed in the *whig* party, it would not be leſs hot and zealous than that of the *tories*; but it is ſaid they have not the direction thereof; which gives room to affirm, that thoſe at the head of the *whig* party are much more moderate than the chiefs of the *tories:* add, that they uſually conduct themſelves on fixed principles, proceed to their end gradually, and without violence; and their ſlowneſs is not leſs founded on good politics, than the haſtineſs of the *tories*.—Thus much, ſays our author, may be ſaid to the advantage of the moderate *whigs*, that, in the general, they maintain a good cauſe, *viz.* the conſtitution of the government as by law eſtabliſhed. See WHIGS.

TORMINA, in medicine, a term ſometimes uſed to expreſs pains in the general; but more particularly a ſpecies of pain called *tormina ventris*, or *alvi*; in Engliſh, the *gripes*. See GRIPES.

Young children are very often troubled with gripes; it is upon this account, that nurſes, in order to prevent or remedy them, uſually mix with their ſpoon-meats, a little brandy or ſome carminative ſeed, as caroway ſeeds, &c. See CHILDREN.

Some children breed their teeth with violent gripes, which is apt to turn to convulſions of the bowels. See DENTITION.

In adults, the dry gripes is uſually cured by the exhibition of warm cathartics, ſuch are tincture of hiera picra, elixir ſalutis, tincture of rhubarb, &c. with the aſſiſtance of opiats.

TORNADO, or TURNADO, a ſudden and violent guſt of wind from all points of the compaſs; frequent on the coaſt of Guinea. See WHIRLWIND.

TORNESOL. See the article TURNESOL.

TORPEDO, in natural hiſtory, a ſea-fiſh, famed both among the ancient and modern naturaliſts, for a remarkable numbneſs wherewith it ſtrikes the arm of ſuch as touch it.

Various are the accounts given us of this ſingular fiſh; ſome authors raiſing the effects it produces, to a kind of miracle; and others treating them as little better than chimera's; ſome ſolving the appearance this way, and ſome that. But M. Reaumur, of the French academy of ſciences, has at length cleared the point, and ſet the matter in a ſatisfactory light.

The *torpedo* is a flat fiſh, much of the figure of the thornback; ſufficiently deſcribed in moſt treatiſes of fiſhes, and commonly enough found about the coaſts of Provence, Gaſcony, &c. where the people eat it without any danger. See its figure repreſented in *Tab. Natural hiſtory*, *fig.* 9.

Phænomena of the TORPEDO.—Upon touching it with the finger, it frequently, though not always happens, that the perſon feels an unuſual painful numbneſs, which ſuddenly ſeizes the arm up to the elbow, and ſometimes to the very ſhoulder and head.

The pain is of a very particular ſpecies, and not to be deſcribed by any words; yet meſſieurs Lorenzini, Borelli, Redi, and Reaumur, who all felt it ſeverely, obſerve it to bear ſome reſemblance to that painful ſenſation felt in the arm, upon ſtriking the elbow violently againſt a hard body: though M. Reaumur aſſures us, this gives but a very faint idea of it.

Its chief force is at the inſtant it begins; it laſts but a few moments and then vaniſhes entirely. If a man do not actually touch the *torpedo*, how near ſoever he holds his hand he feels nothing: if he touch it with a ſtick, he feels a faint effect: if he touch it through the interpoſition of any pretty thin body, the numbneſs is felt very conſiderably; if the hand be preſſed very ſtrong againſt it, the numbneſs is the leſs, but ſtill ſtrong enough to oblige a man ſpeedily to let go.

Theory of the TORPEDO.—There are different ways of accounting for this effect: the firſt is, that of the ancients, who contented themſelves with aſcribing a torporific virtue or faculty to this animal.

The ſecond will have the effect produced by the *torpedo* to depend on an infinite number of corpuſcles iſſuing continually out of the fiſh, but more copiouſly under ſome circumſtances than others: this is the opinion moſt generally received; being adopted by Redi, Perrault, and Lorenzini.

They explain themſelves thus, as the fire emits a quantity of corpuſcles, proper to heat us, ſo the *torpedo* emits a quantity of corpuſcles fit to numb the part they inſinuate themſelves into; whether it be by their entering in too great abundance, or by their falling into tracts or paſſages very diſproportionate to their figures.

The third account, is that of Borelli, who looks on this emiſſion of corpuſcles, as imaginary: he ſays, that upon touching the fiſh, it puts itſelf into a violent tremor or agitation, and that this occaſions a painful numbneſs in the hand that touches it. But M. Reaumur aſſures us, that notwithſtanding all the attention he could view this fiſh withal, when ready to ſtrike the numbneſs, he could perceive nothing of this trembling or agitation.

The laſt and juſteſt hypotheſis, is that of M. Reaumur: the *torpedo*, like other flat fiſhes, he obſerves, is not abſolutely flat, but its back, or rather all the upper part of its body, a little convex: when it did not, or would not, produce any numbneſs in ſuch as touched it, its back, he found, always preſerved its natural convexity; but whenever it would diſpoſe itſelf to reſent a touch or thruſt, it gradually diminiſhed the convexity of the back parts of the body; ſometimes only rendering them flat, and ſometimes even concave.

The very next moment, the numbneſs always began to ſeize the arm; the fingers that touched, were obliged to give back, and all the flat and concave part of the body was again ſeen convex: and whereas it only became flat inſenſibly, it returned to its convexity ſo ſwiftly, that one could not perceive any paſſage from the one to the other ſtate.

The motion of a ball out of a muſket, is not, perhaps, much quicker than that of the fiſh reaſſuming its former ſituation; at leaſt the one is not more perceivable than the other.

It is from this ſudden ſtroke, that the numbneſs of the arm ariſes; and accordingly, the perſon when he begins to feel it, imagines that his fingers have been violently ſtruck. It is the mere velocity of the ſtroke that produces the numbneſs.

The wonder is, how ſo ſoft a ſubſtance, as that of the fiſh, ſhould give ſo rude a blow: indeed a ſingle ſtroke of a ſoft body could never have done it; but in this caſe, there is an infinity of ſuch ſtrokes given in an inſtant. To explain the admirable mechaniſm hereof, we muſt give a view of the parts whereon it depends.

This mechaniſm, then, conſiſts in two very ſingular muſcles, *b*, *b*, deſcribed by ſeveral authors, who have given the anatomy of the *torpedo*. Redi, and after him Lorenzini, call them the *muſculi falcati*; their form is that of creſcents, and they together take up almoſt half the back of the fiſh; the one on the right ſide, and the other on the left. Their origin is a little above the mouth; and they are ſeparated from each other by the bronchia, into the laſt of which they have their inſertion.

What is ſingular in them, is their fibres; if, with the authors above-mentioned, we may give that name to a ſort of ſmaller muſcles as big as gooſe quills; of an aſſemblage whereof the two great muſcles are formed. Theſe leſſer muſcles are hollow cylinders, their length nearly equal to the thickneſs of the fiſh, and ranged a-ſide of each other; all perpendicular to the upper and lower ſurfaces of the fiſh, accounting theſe ſurfaces as two nearly parallel planes. The exterior ſurface of each of theſe cylinders, conſiſts of whitiſh fibres, whoſe direction is the ſame with that of the cylinder: but theſe fibres only form a kind of tube, whoſe parietes are not above the thickneſs of a leaf of paper. The cavity of the tube is full of a ſoft matter, of the colour and conſiſtence of pap, divided into twenty five or thirty different little maſſes, by ſo many partitions, parallel to the baſe of the cylinder; which partitions are formed of tranſverſe fibres: ſo that the whole cylinder is in ſome meaſure compoſed of twenty-five or thirty ſmaller cylinders placed over each other, and each full of a medullary ſubſtance.

We need only now remember, that when the *torpedo* is ready to ſtrike its numbneſs, it ſlowly flattens the outer ſurface of its upper part; and the whole mechaniſm, whereon its force depends, will be apparent. By that gradual contraction it bends, as it were, all its ſprings; renders all its cylinders ſhorter, and at the ſame time augments their baſes, or, which amounts to the ſame, ſtretches all the little incloſures which divides the ſoft matter. In all probability, too, the large fibres, or little muſcles, in that moment, loſe their cylindrical form, to fill the vacuities between them.

The contraction being made to a certain degree, all the ſprings unbend; the longitudinal fibres are lengthened, the tranſverſe ones, or thoſe which form the incloſures, are ſhortened; each incloſure, drawn by the longitudinal fibres which are lengthened, drives the ſoft matter it contains, upwards; in which it is apparently aſſiſted by the undulatory motion, which is in the tranſverſe fibres when contracting.

If then, a finger touch the *torpedo*, it inſtantly receives a ſtroke, or rather ſeveral ſucceſſive ſtrokes, from each of the cylinders whereon it is applied. As the ſoft matter is diſtributed into divers incloſures, it is more than probable, all the ſtrokes are not given preciſely at the ſame moment: nay, were there no incloſures to ſeparate the matter, its impreſſion would give ſtrokes, in ſome meaſure, ſucceſſive: for all parts of ſoft bodies do not ſtrike at once; the impreſſion of the laſt does not take till after the firſt have done acting. But theſe ſeveral incloſures ſerve to augment the number of the ſprings, and, of conſequence, the velocity and force of the action.

Theſe quick re-iterated ſtrokes given by a ſoftiſh matter, ſhake the nerves, ſuſpend, or change the courſe of the animal ſpirits, or ſome fluid equivalent: or, if you had rather, theſe ſtrokes produce an undulatory motion in the fibres of the nerves, which claſhes or diſagrees with that they ſhould have, in order to move the arm. And hence the inability we are under of uſing the ſame, and the painful ſenſation which accompanies it.

Hence it is, that the *torpedo* does not convey its numbneſs to any degree, except when touched on theſe great muſcles; ſo that the fiſh is very ſafely taken by the tail, which is the part by which the fiſhermen catch it.

The authors who have accounted for the effect of the *torpedo* from torporific effluvia, have been obliged to have recourſe to the ſame two muſcles; but then they only make them reſervoirs of the corpuſcles, whereby the numbneſs is effected.

Lorenzini, who has obſerved the contraction as well as Reaumur, pretends that all its uſe, is to expreſs thoſe corpuſcles from out of the hollow fibres of theſe muſcles wherein they are impriſoned; but this emanation of corpuſcles admitted by moſt authors, is diſproved by M. Reaumur, from the following conſiderations:

1°. In that no numbneſs is conveyed, if the hand be at the ſmalleſt diſtance from the *torpedo*: now, to uſe their own compariſon, if the *torpedo* numbs as the fire warms, the hands would be affected at a diſtance from the one as well as the other.

2°. In that the numbneſs is not felt till the contraction of the muſcles is over; whereas were the cauſe in torporific particles expreſſed by the contraction, the effect would be felt in the time of the contraction.

3°. In that were the numbneſs the effect of torporific particles, it would be conveyed by degrees, as the hand warms by degrees, Laſtly, in that the *torpedo* conveys its numbneſs to the hand, through a hard, ſolid body, but does not do it through the air.

Were the only uſe the *torpedo* makes of its faculty, the ſaving itſelf from the fiſhermen, as ſome have ſuppoſed, it would ſignify but little; for it is very rare that it eſcapes their hands.

Pliny, Ariſtotle, and moſt naturaliſts, therefore agree, that it likewiſe ſerves it for the catching of other fiſhes: all we know for certain, is, that it lives on other fiſhes, and that it is generally found on banks of ſand, *&c.* probably to ſerve it as a foundation or ſupport for the exerting its faculty.

M. Reaumur had no fiſhes alive to examine what the *torpedo* would do to them; but an animal, next a-kin to a fiſh he tried it on, *viz.* a drake, which being ſhut up a while in water with the fiſh, was taken out dead; doubtleſs from its too frequent contacts on the *torpedo*.

In the hiſtory of Abyſſinia, we are aſſured, that if the *torpedo* kill living fiſhes, it ſeems to bring dead ones to life again; dead fiſhes being ſeen to ſtir if put in the ſame veſſel with it: but this is much leſs credible than what is told us in the ſame hiſtory, that the Abyſſinians uſe *torpedo's* for the cure of fevers, by tying down the patient to a table, and applying the fiſh ſucceſſively upon all his members, which puts him to cruel torment, but effectually rids him of his diſeaſe.

Bellonius aſſures us, that our own *torpedo's*, applied to the ſoals of the feet, have proved ſucceſsful againſt fevers.

M. du Hamel, in his hiſtory of the academy of ſciences, *anno* 1677, mentions a kind of *torpedo's*, which he compares to conger eels: M. Richer, from whom he has the account, aſfirms, on his knowledge, that they numb the arm ſtrongly, when touched with a ſtaff, and that their effects even go to the giving vertigo's.

TORQUE, in heraldry, a round roll of cloth twiſted and ſtuffed; ſuch is the bandage frequently ſeen in armories about the heads of moors, ſavages, *&c.*

It is always of the two principal colours of the coat. The *torque* is the leaſt honourable of all the enrichments wore on the helmet by way of creſt. See CREST.

TORREFACTION, * in pharmacy, a kind of roaſting or aſſation, wherein a drug is laid to dry on a metalline plate placed over coals, till it become friable to the fingers. See ASSATION.

* The word is formed from the Latin, *torrefacere, to roaſt.*

Torrefaction, is particularly uſed, when, after reducing ſome drug, as rhubarb, or myrabolans, into powder, it is laid on an iron or ſilver plate, and that placed over a moderate fire till the powder begin to grow darkiſh; which is a mark thoſe remedies have loſt their purgative virtue, and have acquired a more aſtringent one. See RHUBARB, USTION, *&c.*

Formerly they uſed to *torrefy* opium, to get out ſome malignant parts fancied to be in it, before they durſt uſe it in medicine; but the effect was, that its volatile ſpirits and ſulphur, wherein its greateſt virtue conſiſts, were hereby evaporated. See Opium.

TORRENT, Torrens, in geography, a temporary ſtream of water, falling ſuddenly from mountains wherein there have been great rains, or an extraordinary thaw of ſnow; ſometimes making great ravages in the plains. See River, *&c.*

TORRICELLIAN, a term very frequent among phyſical writers, uſed in the phraſes, *torricellian tube*, and *torricellian experiment*, on account of the inventor, Torricelli, a diſciple of the great Galileo.

Torricellian *Tube*, is a glaſs tube, as AB, about 3 foot long, and 3¼ of an inch in diameter, repreſented *Tab. Pneumatics, fig.* 6. *n.* 2. whoſe upper orifice A is hermetically ſealed.

Torricellian *Experiment*, is performed by filling the *torricellian* tube AB with mercury; then ſtopping the orifice B with the finger, inverting the tube, and plunging that orifice in a veſſel of ſtagnant mercury C.—This done, the finger is removed, and the tube ſuſtained perpendicular to the ſurface of the mercury in the veſſel. See Mercury.

The conſequence is, that part of the mercury falls out of the tube into the veſſel, and there only remains enough in the tube to fill from 28 to 31 inches of its capacity, above the ſurface of the ſtagnant mercury in the veſſel.

Thoſe 28, *&c.* inches of mercury are ſuſtained in the tube by the preſſure of the atmoſphere on the ſurface of the ſtagnant mercury; and according as that atmoſphere is more or leſs heavy, or as the winds blowing upwards or downwards, heave up or depreſs the air, and ſo increaſe or diminiſh its weight and ſpring, more or leſs mercury is ſuſtained from 28 inches to 31. See Air, and Atmosphere.

The *torricellian experiment* makes what we now call the *barometer.* See Barometer.

TORRID *Zone*, that tract of earth lying under the line, and extending on each ſide to the two tropics, or to 23 degrees and a half of latitude. See Tropic, Zone, *&c.*

The ancients believed the *torrid zone* uninhabitable; but from the late navigations we learn, that the exceſſive heat of the day there is tempered by the coldneſs of the night.

TORT, in law, denotes injuſtice, or injury: as, *de ſon tort meme*, in his own wrong, *&c.* See Wrong, and Injury. Hence alſo *tort-feaſor*, &c.—The word is pure French, where it ſignifies the ſame.

Executor de ſon Tort. See the article Executor.

TORTOISE-*Shell*, the ſhell, or rather ſcales [*] of a teſtaceous animal, called a *tortoiſe*; uſed in inlaying, and in various other works, as for ſnuff-boxes, combs, *&c.* See Testaceous, and Shell.

> [*] Mr. Cateſby obſerves, that this hard ſtrong covering which incloſes all ſorts of tortoiſes is very improperly called a ſhell; being of a perfect bony contexture; but covered on the out ſide with ſcales, or rather plates, of a horny ſubſtance: which are what the workmen call *Tortoiſe-ſhell.* Phil. Tranſ. Nº 438. p. 117.

There are two kinds of *tortoiſes, viz.* the *land* and *ſea tortoiſe*; *teſtudo terreſtris, & marina.*

The *ſea tortoiſe*, again, is of four kinds, *viz.* the *freſh tortoiſe*, the *caretta*, the *cahobanna*, and the *lager-hu*; but it is the caret alone furniſhes that beautiful ſhell, ſo much admired in Europe.

The ſhell of the caretta, or hawkſbill tortoiſe is thick, and conſiſts of two parts, the upper, which covers the back, and the lower, the belly: the two are joined together at the ſides by ſtrong ligaments, which yet allow of a little motion.—In the fore part is an aperture for the head and fore legs, and behind for the hind legs and tail.

It is the under ſhell alone is uſed: to ſeparate it from the upper, they make a little fire beneath it, and as ſoon as ever it is warm, the under ſhell becomes eaſily ſeparable from the upper with the point of a knife, and is taken off in laminæ or leaves, without killing the animal, which, it is ſaid, being turned to ſea again, gets a new ſhell.

The whole ſpoils of the caret conſiſt in 13 leaves or ſcales, 8 of them flat, and five a little bent: of the flat ones, there are 4 large ones, about a foot long, and ſeven inches broad.

The beſt *tortoiſe-ſhell* is thick, clear, tranſparent, of the colour of antimony, ſprinkled with brown and white: when uſed in marquetry, *&c.* the workmen give it what colour they pleaſe by means of coloured leaves which they put underneath it.

In generation, Rondeletius obſerves, the embraces of the male and female *ſea-tortoiſes* continue for a whole lunar month; and that they ſquirt water out of their noſtrils in the ſame manner as the dolphin. On the Braſilian ſhore they are ſaid to be ſo big as ſometimes to dine fourſcore men; and that in the Indian ſea the ſhells ſerve the natives for boats. De Laet notes, that in the iſland of Cuba they are of ſuch a bulk, that they will creep along with five men on their backs.

TORTOISE, in the military art. See Testudo.

TORTURE, a grievous pain inflicted on a criminal, or perſon accuſed, to make him confeſs the truth. See Question.

The forms of *torture* are different in different countries. In ſome they uſe water, in others iron, in ſome the wheel or rack, in ſome the boot, thumbkins, *&c.* See Rack, Boot, *&c.*

In England the uſe of all *torture* is aboliſhed, both in civil and criminal matters, and even in caſes of high treaſon; though ſomething like it ſtill obtains, where the criminal refuſes to plead. See Paine *fort &-dure.*

In France the *torture* is not practiſed in civil matters; but by an ordonnance of 1670, if a perſon be accuſed of a capital crime, he may be put to the queſtion, *i. e.* to the *torture*, if there be conſiderable proof againſt him, and yet not proof enough to convict him. See Proof.

There are two kinds of *torture:* the one *preparatory*, appointed before ſentence paſſed; the other *definitive*, decreed by a ſentence of death.

The *preparatory torture* is ordered *manentibus indiciis*, ſo that if the accuſed do not confeſs, he cannot be condemned to death, but only *ad omnia citra mortem.*

The *definitive torture* is that which a condemned criminal is put to, to make him confeſs his accomplices. The ordinary *torture* is given at Paris with ſix pots of water, and the little treſtle; and the extraordinary, with ſix other pots, and the great treſtle.

In Scotland the *torture* is given with the boot. See Boot.—In ſome other countries, by heating the criminals feet; in others, with wedges, *&c.*

The *torture*, ſays M. Bruyere, is a ſure expedient to deſtroy an innocent perſon of a weak complexion, and to ſave a criminal of a robuſt one.—It was a noble ſaying of an ancient, *They who can bear the torture will lie, and they who cannot bear it.*

TORY. See the article Tories.

TOTAL *Cauſe*, } See the articles { Cause.
Total *Eclipſe*, } { Eclipse.

TOTTED.—A good debt to the king is, by the foreign appoſer, or other officer in the Exchequer, noted for ſuch by writing the word *tot*, q. d. *tot pecuniæ regi debentur*, whence it is ſaid to be *totted.*—Alſo that which is paid is to be *totted.* See Exchequer.

TOUCAN, in aſtronomy, a modern conſtellation of the ſouthern hemiſphere, conſiſting of eight ſmall ſtars; otherwiſe called *anſer Americanus.* See Constellation.

TOUCH, in muſic. An organ is ſaid to have a good *touch*, or ſtop, when the keys cloſe and lie down well, being neither too looſe nor too ſtiff. See Organ.

Touch *the wind*, in the ſea language, is when the ſteer's-man at the helm is bid to keep the ſhip as near the wind as may be. See Steering.

TOUCHING is ſometimes uſed for the ſenſe of feeling. See Feeling.

Touching, in geometry. A right line is ſaid to *touch* a circle, when it meets in ſuch a manner as, that being produced, it does not cut, but falls without the circle. See Tangent.

TOUCH-*ſtone*, a black, ſmooth, gloſſy ſtone, uſed to try metals upon. See Stone, Essay, *&c.*

The ancients called it *lapis Lydius*, the *Lydian ſtone*, from Lydia, a country of Aſia minor, whence it was brought.

The moderns call it *touch-ſtone*, in regard the proof they make of metals, chiefly ſilver, is by touching or rubbing the metal to be tried on this ſtone, and comparing the colour of the mark it leaves thereon, with the mark of another piece of metal of the ſame ſpecies, whoſe goodneſs is paſt doubt. See Metal, and Assay.

TOUMAN. See the article Toman.

TOURNAMENT. See the article Turnament.

TOUR, *Turn*, a French term, often uſed among Engliſh writers for a journey.—Thus we ſay the *tour* of Paris, of Rome, *&c.*

Tour *of hair*, a treſs or border of hair, going round the head, which, mingled dextrouſly with the natural hair, lengthens and thickens it. See Hair.

Theſe *tours* are for men.—The women likewiſe uſe *tours*, and falſe hair, either to hide their age, or to ſupply the thinneſs of their natural hair on the forehead and temples.

The form is different according to the mode, ſometimes raiſed and curled, ſometimes ſtraight and laid flat along the forehead. See Perruke.

TOURN, in law. See the article Turn.

TOUT *temps priſt & uncore eſt*, that is, always ready, and ſo at the preſent time: a kind of plea in way of excuſe or defence for him that is ſued for any debt or duty belonging to the plaintiff. See Plea, Tender, Uncore, *&c.*

Per my & per Tout. See the article Per.

TOW.—Whatever is drawn or dragged after a ſhip or boat with a rope, is ſaid to be *towed.* See Towage.

TOWAGE, [*] the haleing or drawing a ſhip or barge by men or beaſts, or by another ſhip or boat faſtened to her, in order to make her enter a port, aſcend a river, or the like.

> [*] The word is probably derived from the Saxon, *teon, to draw, drag.*

The term is alſo uſed for money, or other recompence, given by bargemen to the owner of the ground next the river where they *tow* a barge or other veſſel, for the liberty of paſſing along the ſide thereof.

TOWER, Turris, a tall building, conſiſting of ſeveral ſtories, are uſually of a round form, though ſometimes ſquare, or polygonal.

Before the invention of guns, they uſed to fortify places with *towers*, and to attack them with moveable *towers* of wood, mounted on wheels, to ſet the beſiegers on a level with the walls, and drive the beſieged from under the ſame.

Theſe *towers* were ſometimes 20 ſtories, and 30 fathom high: they were covered with raw ſkins, and an hundred men employed to move them.

Towers are alſo built to enable one, by their elevation, to view to a great diſtance.—Theſe are of all figures, as ſquare, round, pentagonal, *&c.* See Pharos.—In China is a famous *tower* of Porcelain, whereof the Dutch relate wonders.

Towers are alſo built for fortreſſes, priſons, *&c.* as the *Tower* of London, the *towers* of the Baſtile, *&c.* See Fortified *Place*.

The *Tower* of London is not only a citadel to defend and command the city, river, *&c.* but alſo a royal palace where our kings with their courts have ſometimes lodged; a royal arſenal, wherein are arms and ammunition for 60000 ſoldiers: a treaſury for the jewels and ornaments of the crown; a mint for coining of money; the great archive, wherein are preſerved all the ancient records of the courts of Weſtminſter, *&c.* and the chief priſon for ſtate criminals. See Arsenal, Mint, *&c.*

In the midſt of it is the great ſquare, white *tower*, built by William the Conqueror.—Within the *Tower* is a parochial church, exempt from all juriſdiction of the archbiſhop, and a royal chapel, now diſuſed.

The chief officer of the *Tower* is the conſtable, under whom is the lieutenant, who acts by his direction, and in his abſence. He has, by grant of ſeveral of our kings, *unam lagenam*, two gallons and a pint of wine out of every veſſel, and a certain quantity out of every boat laden with lobſters, oyſters, and other ſhell-fiſh, and double the quantity out of every alien's boat paſſing by the *Tower*: to him alſo belongs a fee of 200 *l.* for every duke committed priſoner, 100 *l.* for every peer not a duke, and 50 *l.* for every commoner. See Constable, *&c.*

Under the conſtable, and in his abſence, under the lieutenant, are a *gentleman-porter*, and divers warders.—The firſt has charge of the gates to lock and unlock them, and deliver the keys every night to the conſtable or lieutenant, and receive them of him next morning: he commands the warders who are upon the day's wait, and at the entrance of a priſoner has for his fee *veſtimenta ſuperiora*, or elſe a compoſition for the ſame, which is uſually 30 *l.* for a peer, and 5 *l.* a-piece for others.

Note, the ancient allowance from the king to a duke or marquis, priſoner in the *Tower*, was 12 *l.* a week, now but 4 *l.* To all other lords anciently 10 *l.* a week, now 2 *l.* 4 *s.* 5 *d.* To knights and gentlemen anciently 4 *l.* a week, now 13 *s.* and 4 *d.* And to inferior perſons, now 10 *s.* a week.

For the yeomen warders of the *Tower*. See Warder.

In the *Tower* is likewiſe kept a court of record every Monday, by preſcription, for the liberty of the *Tower*, of debt, treſpaſs, and other actions of any ſum. See Court.

Beſide the ancient liberty of the *Tower*, which adjoins to it, the Old Artillery Garden by Spittle-Fields, and the Little Minories, are within the *Tower* liberty, within which the gentleman-porter has the ſame power and authority as ſheriffs within their reſpective counties. See Ordnance, *&c.*

Hollow **Tower**, in fortification. See Hollow *Tower*.

TOWN, a place inhabited by a conſiderable number of people, of an intermediate magnitude and degree between a city, and a village. See Village, *&c.*

It is hard to give a tolerable definition of a *town*, in regard the idea is a little arbitrary, and unfixed. A *town* is generally without walls, which is the character that uſually diſtinguiſhes it from a city; but this does not hold univerſally. See City.

We have ſeveral kinds of *towns*, borough *towns*, market *towns*, county *towns*, &c. See Borough, *&c.*

Town-*houſe*, } See the articles { House.
Freedom of a **Town**, } See the articles { Freedom.
Hanſe **Towns**, } See the articles { Hanse.

TOXICUM, ΤΟΞΙΚΟΝ, a ſort of poiſon, ſaid to be uſed by the Indians to their arrows, in order to render wounds made by them incurable. See Poison.

The Indians are ſuppoſed to poiſon their arrows, daggers, *&c.* with the virus of vipers, the miſchievous effects whereof continue a long time after the matter is quite dried up. See Viper.

TRABEATION, Trabeatio, in the ancient architecture, the ſame with entablature. See Entablature.

It conſiſts of three principal members or diviſions, *viz.* the architrave, freeze and cornice, each of which conſiſts of divers leſſer members and ornaments. See Architrave, Freeze, *&c.*

The proportion, members, *&c.* are different in the ſeveral orders. See Order; ſee alſo each order apart, Tuscan, Doric, *&c.*

TRACE, a mark or impreſſion which any thing leaves behind it in paſſing over another. See Mark, Impression, *&c.*

Traces *of the brain*, among the Carteſian philoſophers, are thoſe impreſſions, more or leſs deep, which ſenſible objects make on the fine fibres of the brain, by means of the organs of ſenſe. See Brain.

Theſe impreſſions are alſo called *traces of the object*; the courſe of the animal ſpirits ſerves to keep them up, and to renew them. See Spirit.

The vivacity of the imagination ariſes from the prodigious quantity of *traces* of different objects in the brain, which are ſo linked together, that the ſpirits cannot be ſent into one of them, but they run into all the reſt; by which means the ideas occaſioned by the application of the ſpirits to thoſe ſeveral *traces*, are all excited, as it were, at once. See Imagination.

Memory, according to the ſame, conſiſts in the *traces* which the animal ſpirits have impreſſed. See Memory, Habit, *&c.*

Trace *of a hare*, among hunters, is her footing in the ſnow; diſtinct from other treadings, called *doubling*, and *pricking*, &c.

Traces alſo denote the tracks of ravenous beaſts, as wolves, wild beaſts, *&c.*

TRACHEA,* in anatomy, a large arterial veſſel, called alſo *aſpera*, and popularly the *wind-pipe*, being the canal or tube which carries the air into the lungs, for the uſe of reſpiration and ſpeech.—See *Tab. Anat.* (Splanch.) *fig.* 14. *lit. cc, ee. dd.* &c. See alſo the article Aspera.

* Galen gave it the name *trachea*, τραχεια, becauſe of its being rough and uneven; on which account the Latins alſo called it *aſpera*.

TRACHOMA, ΤΡΑΧΩΜΑ, in medicine, a roughneſs or aſperity of the inner part of the palpebræ, attended with an itching, redneſs, and frequently with puſtles, reſembling millet-ſeeds.

Its degrees are the ſycoſis, and tyloſis, or rather thoſe are higher diſorders into which the *trachoma* is liable to degenerate.

TRACT, Tractus, properly denotes an extent of ground, or a portion of the ſurface of the terraqueous globe. See Terraqueous, *&c.*

Tract, or **Tractate**, **Tractatus**, does alſo ſignify a ſmall treatiſe, or written diſcourſe upon any ſubject. See Treatise.

Tract, in hunting, denotes the trace or footing of a wild beaſt. See Trace.

TRACTION, *drawing*, the act of a moving power whereby the moveable is brought nearer to the mover; called alſo *attraction*. See Attraction.

TRACTRIX, in geometry, a curve line, called alſo *catenaria*. See Catenaria.

TRADE, *traffic*, *commerce*, the act or art of dealing, buying, ſelling, exchanging, *&c.* of commodities, bills, money, *&c.* See Exchange, Bill, Money, Merchandize, *&c.*

For the origin, progreſs, *&c.* of *trade*. See Commerce, and Navigation.

Balance of **Trade**. See the article Balance.

Trade-*Winds* denote certain regular winds at ſea, blowing either conſtantly the ſame way, or alternately this way and that; thus called from their great uſe in navigation, and the Indian commerce.

The *trade-winds* are of different kinds, ſome blowing three or ſix months of the year one way, and then the like ſpace of time the oppoſite way; very common in the Indian ſeas, and called *monſoons*. See Monsoon.

Others blow conſtantly the ſame way; ſuch is that general wind between the tropics, which off at ſea is found to blow all day long from eaſt to weſt.—For the phænomena of each, with their phyſical cauſes, ſee Wind.

Dr. Liſter has a conjecture in the *Philoſophical Tranſactions*, that the tropical or *trade-winds* ariſe, in great part, from the daily and conſtant breath of a ſea-plant, called the *ſargoſſa*, or *lenticula marina*, which grows in vaſt quantities from 36° to 18° north latitude, and elſewhere upon the deepeſt ſeas.—For the matter of wind coming from the breath of one only plant, muſt needs be conſtant and uniform; whereas the great variety of trees and plants at land, furniſhes a confuſed matter of winds. Hence, he adds, it is, that theſe winds are briſkeſt about noon; the ſun quickening the plant moſt then, and cauſing it to breathe faſter and more vigorouſly. Laſtly, the direction of this wind from eaſt to weſt, he attributes to the general current of the ſea; for a gentle air is obſerved to be conſtantly led along with the ſtream of a river: nor muſt it be omitted, that every plant is, in ſome meaſure, a heliotrope, and bends itſelf, and moves after the ſun, and conſequently emits its vapour thitherward; ſo that the direction of the *trade-wind* is, in ſome meaſure, alſo owing to the courſe of the ſun.

Dr. Gordon has another hypotheſis: the atmoſphere, which ſurrounds the earth, and moves along with it in its diurnal motion, he ſuppoſes to keep pace therewith, that part of it at leaſt which is near the earth, if the remoter part ſhould be judged to loſe ground.

If then there were no changes in the atmoſphere's gravity, he ſuppoſes it would always go along with the earth from weſt to eaſt in an uniform motion, altogether inſenſible to us: but the portion of the atmoſphere under the line being extremely rarefied, its ſpring expanded, and ſo its gravity and preſſure much leſs than the neighbouring parts of the atmoſphere, it is incapable of the uniform motion towards the eaſt, and muſt therefore be preſſed weſtwards, and makes the continual breeze from eaſt to weſt between the tropics.

TRADING *Society*. See the article SOCIETY.

TRADITA *Nexu*. See ABALIENATION.

TRADITION, TRADITIO, the act of delivering a thing into the hands of another.—The ſale of a moveable is compleated by a ſimple *tradition*. See LIVERY.

TRADITION, in matters of religion, is applied to thoſe laws, doctrines, relations, &c. which have been handed down to us from our fore-fathers, without being written.

Taking *tradition* in this ſenſe, for every thing relating to faith, or the rites and ceremonies of religion thus derived down to us from the primitive church, there are two kinds, *viz. apoſtolical* and *eccleſiaſtical tradition*.

Apoſtolical TRADITION, which is what we properly call *tradition*, is defined by the Romaniſts to be the unwritten word of God, deſcended from the apoſtles to us through a continual ſucceſſion of the faithful.

By this *tradition*, ſay they, it is, that the holy ſcriptures have been kept intire, both as to the letter, *i. e.* the text, and as to the ſpirit or ſenſe thereof. This *tradition* the council of Trent declares to have the ſame authority with the holy ſcripture itſelf, and pronounces every one who rejects it a heretic.

Eccleſiaſtical TRADITIONS, are certain ſtatutes and regulations regarding the rites, cuſtoms and circumſtances of religion, introduced ſince the time of the apoſtles by councils, popes, &c. and continued to our time through a conſtant obſervance of the church.

The Romaniſts make another diviſion of *tradition*, *viz.* into *written* and *unwritten*.

Written TRADITION, is that whereof we find ſome traces in the ancient fathers, and doctors.

Unwritten TRADITION, is that whereof there appear no ſigns or ſteps in any of the fathers extant.

The church of Rome pretends to be the depoſitory of each kind: *tradition* ſhe holds to be abſolutely neceſſary in the church, grounding this neceſſity on the promiſe of infallibility which Jeſus Chriſt is pretended to have made her.

Yet others of that communion deny *tradition*, how excellent ſoever it may be for the reclaiming of heretics, to be abſolutely neceſſary; maintaining, that the church would not be leſs infallible, nor leſs the rule of doctrine, &c. if the fathers had never wrote at all.

TRADITIONARY, TRADITIONARIUS, a name given among the Jews, to ſuch of them as acknowledge tradition, follow it, and explain the ſcriptures thereby: in oppoſition to the Caraites, who refuſe any thing but the pure ſcriptures themſelves. See CARAITE.

The *traditionaries* are what we more uſually call rabbins and rabbiniſts, or talmudiſts. See RABBIN, RABBINISTS, TALMUD, &c.—Hillel ſhone among the *traditionaries*, and Schammai among the textuaries. See TEXTUARY.

TRADITORES, a name given in the firſt ages of the church to ſuch chriſtians as, in times of perſecution, to avoid death and martyrdom, delivered up the ſacred writings to the perſecutors.

The enemies of religion, even under the old law, made their utmoſt efforts to deprive the world of the holy ſcriptures: in that cruel perſecution which Antiochus raiſed againſt the Jews, the books of the law were very ſolicitouſly ſought after, torn, and burnt, and ſuch as kept them put to death; as we read in the firſt book of Maccab. cap. i, ver. 56, 57.

Diocleſian renewed the ſame impiety, by an edict publiſhed in the 19th year of his empire, commanding all the ſacred books to be brought to the magiſtrates, and burnt.

Many weak chriſtians, and even ſome biſhops, overcome by the fear of puniſhment, carried in their books to the perſecutors; which the church deteſting, made very ſevere laws againſt them, and gave them the infamous name of *traditores*, from *trado*, *I deliver*, *betray*.

As the great pretence of the ſchiſm of the Donatiſts was, that the catholics tolerated the *traditores*, it was decreed in the council of Arles, held in 314, that ſuch as ſhould be found guilty of having delivered up any of the holy books or veſſels, ſhould be depoſed from the order of the clergy, &c.

TRADUCIANS,* TRADUCIANI, a name which the Pelagians anciently gave the catholics, becauſe of their teaching that original ſin was tranſmitted from father to children, or that it was communicated to the children by the father in the way of generation. See ORIGINAL *Sin*.

* The word is formed of the Latin, *tradux*, which was made uſe of to expreſs that communication; and which comes from *traduco*, *I tranſmit*, or *propagate* from one to another.

At preſent ſome give the appellation *traduciani* to ſuch as hold that the ſouls are tranſmitted to the children by the father. See SOUL.

TRADUCTION,* the act of tranſlating, or turning out of one language into another. See TRANSLATION, and METAPHRAST.

* The word is formed of *trans*, *beyond*, and *duco*, *I lead*, *draw*.

TRAFFIC.* See the article TRADE, and COMMERCE.

* The word is formed from the French, *trafic*, and that from the Italian, *traffico*, which is again borrowed from the Arabic.

The principal *traffic* in Muſcovy and the North is in furs and ſkins: the great *traffic* of the Dutch in the Eaſt is in ſpices: the *traffic* of money is moſtly carried on at the Exchange.

TRAFINE. See TREPANUM.

TRAGACANTH,* or ADRAGANTH, *Gum Dragon*, a kind of gum oozing out at inciſions, made in the trunk and larger branches of a plant or little ſhrub of the ſame name, growing in the Levant. See GUM, and DIATRAGACANTH.

* The word is Greek, τραγακανθα, formed of τραγος, *goat*, and ακανθα, *thorn*, by reaſon the plant is beſet with prickles.

The naked hillocks of mount Ida in Candia, M. Tournefort tells us, produce a deal of the plant *tragacantha*, or goat's-thorn, which gives the gum ſpontaneouſly towards the end of June, and in the following months, when the nutricious juice of the plant, thickened by the heat, burſts moſt of the veſſels it is contained in.

This juice coagulates in threads, which make their way into the pores of the bark, where being puſhed forwards by new juice, they get through the bark, and are at length hardened in the air, either into little lumps, or into twiſted pieces in form of little worms, more or leſs long, according to the ſtore of the matter they are formed of.

It ſhould ſeem too that the contraction of the fibres contributes to the expreſſion of the gum: thoſe fine fibres, like the fibres of hemp, laid bare and trampled under foot by men and horſes, contract themſelves, and facilitate the expreſſion of the extravaſated juice.—The plant grows alſo in ſeveral places of the Levant, particularly about Aleppo.

The gum is of different colours and qualities, ſome being white, other-ſome greyiſh, ſome red, and ſome almoſt black. The white is the beſt: it muſt be choſen clear, ſmooth and twiſted worm-like.

It diſſolves eaſily in any aqueous menſtruum, which it will give the conſiſtence of a ſyrup to, in the ſmall proportion of a dram to a pint. It is ſmooth and ſoftening, and therefore good to obtund the acrimony of any humours, which makes it of ſervice in ſuch coughs as proceed from catarrhs and defluxions of rheum. It is alſo very ſtrengthening in ſome ſeminal weakneſſes, and prevalent againſt the whites in women.

TRAGEA, in pharmacy, an aromatic powder groſly beaten and mixed with ſugar; taken by way of carminative.

TRAGEDY, a dramatic poem, repreſenting ſome ſignal action performed by illuſtrious perſons, and which has frequently a fatal iſſue, or end. See DRAMA, and ACTION.

Ariſtotle more ſcientifically defines *tragedy*, the imitation of one grave and intire action, of a juſt length, and which, without the aſſiſtance of narration, by raiſing of terror and compaſſion, refines and purges our paſſions.

This definition has given the critics ſome perplexity; and Corneille declares he cannot reconcile Ariſtotle with himſelf: the inſtances Ariſtotle cites, he thinks, ruin his own definition. He even denies the purging our paſſions to be the end of *tragedy*. See PASSIONS.

Our Engliſh authors are more favourable to the definition: by the purging our paſſions, they underſtand not the extirpating them, but the reducing them to juſt bounds; for by ſhewing the miſeries that attend a ſubjection to them, it teaches us to watch them more narrowly; and by ſeeing the great misfortunes of others, it leſſens the ſenſe of our own.

Tragedy, in its original, M. Hedelin obſerves, was only a hymn ſung in honour of Bacchus by ſeveral perſons, who, together, made a chorus of muſic with dances and inſtruments. See CHORUS.

As this was long, and might fatigue the ſingers, as well as tire the audience, they bethought themſelves to divide the ſinging of the chorus into ſeveral parts, and to have certain recitations in the intervals. See SATYR.

Accordingly, Theſpis firſt introduced a perſon upon the ſtage with this view: Æſchylus finding one perſon inſufficient, introduced a ſecond to entertain the audience more agreeably by a kind of dialogue: he alſo cloathed his perſons more decently, and firſt put them on the buſkin. See COTHURNUS.

The perſons who made theſe recitations on the ſcene, were called *actors*; ſo that *tragedy* at firſt was without actors. And what they thus rehearſed, being things added to the ſinging of the chorus, whereof they were no neceſſary part, were called *epiſodes*. See EPISODE.

Sophocles found that two perſons were not enough for the variety of incidents, and accordingly introduced a third: and here the Greeks ſeem to have ſtopped, at leaſt it is very rare that they introduce four ſpeakers in the ſame ſcene. See PERSON.

Tragedy and comedy were at firſt confounded with each other, but they were afterwards ſeparated; and the poets applied themſelves to the cultivating of *tragedy*, neglecting comedy. See COMEDY.

When *tragedy* was got into a better form, they changed the meaſure of its verſe, and endeavoured to bring the action within the compaſs of a day, or of a revolution of the ſun. See Unity.

For the ſeveral parts of *tragedy*, ſee Act, Scene, Action, Fable, Character, Manners, &c.

The Engliſh received the firſt plan of their drama from the French, among whom it had its firſt riſe toward the end of the reign of Charles V. under the title of *chant-royal*, which conſiſted of pieces in verſe compoſed in honour of the virgin, or ſome of the ſaints, and ſung on the ſtage: they were called by the title *chant-royal*, becauſe the ſubject was given by the king of the year, or the perſon who had bore away the prize the year preceding.

The humour of theſe pieces run wonderfully among the people, inſomuch that in a little time there were formed ſeveral ſocieties, who began to vie with each other: one of theſe, to engage the town from the reſt, began to intermix various incidents or epiſodes, which they diſtributed into *acts*, *ſcenes*, and as many different perſons as were neceſſary for the repreſentation. Their firſt eſſay was in the Bourg St. Maur, and their ſubject the paſſion of our Saviour. The prevot of Paris prohibiting their continuing of it, they made application to court; and to render it the more favourable to them, erected themſelves into a friary, or fraternity, under the title of *brothers of the paſſion*; which title has given ſome occaſion to ſuſpect them to have been an order of religious.

The king, on ſeeing and approving ſome of their pieces, granted them letters of eſtabliſhment in 1402; upon which they built a theatre, and for an age and a half acted none but grave pieces, which they called *moralities*; till, the people growing weary of them, they began to intermix farces or interludes taken from prophane ſubjects.

This mixture of farce and religion diſpleaſing many, they were re-eſtabliſhed by an arret of parliament in 1548, on condition of their acting none but profane, lawful and decent ſubjects, without intermeddling with any of the myſteries of religion; and thus were the brothers of the paſſion deſpoiled of their religious character: upon which they mounted the ſtage no more in perſon, but brought up a new ſet of comedians, who acted under their direction.

Thus was the drama eſtabliſhed, and on this foundation arrived in England. In proceſs of time, as it was improved, it became divided into two branches, agreeable to the practice of the ancients, and the nature of things, *viz.* into *tragedy* and comedy properly ſo called; and this laſt again was ſubdivided into pure comedy and farce. See each under its proper head, Comedy, &c.

Hilaro Tragedy. See the article Hilaro *Tragedia.*

TRAGI-COMEDY, a kind of dramatic piece, repreſenting ſome action paſſed among eminent perſons, the event whereof is not unhappy or bloody, and wherein is ſometimes admitted a mixture of leſs ſerious characters.

The ancients, M. Dacier obſerves, knew nothing of ſuch compoſitions, wherein the ſerious and comic are blended; nor does the epithet M. Corneille gives them of heroic comedies, excuſe their irregularity.

Their foundation is certainly bad; for, endeavouring both to make us laugh and cry in their turns, they endeavour at contrary emotions, which the heart can never undergo; every thing that diſpoſes for the one, indiſpoſing for the other.

The *tragi-comedy* was formerly very common on the Engliſh ſtage: ſcarce ſuch a thing in the 17th century as a pure tragedy without a ſpice of comedy or farce to make the people laugh. Now, that the ſtage and our taſtes are brought nearer to the model of nature and the ancients, the *tragi-comedy* is diſuſed. *Tragi-comedy* is the only caſe, wherein comedy is allowed to introduce kings and heroes. See Comedy.

TRAGUS, ΤΡΑΓΟΣ, in anatomy, one of the protuberances of the auricle, or external ear; called alſo *hircus*, becauſe uſually hairy. See Ear.

The *tragus* is that protuberance next the temple:—that on the oppoſite ſide, to which the ſoft lobe of the ear is annexed, is called the *antitragus*.

TRAJAN *Column*, a famous hiſtorical column, erected in Rome, in honour of the emperor *Trajan*. See Column.

It is of the Tuſcan order, though ſomewhat irregular: its height is eight diameters, and its pedeſtal Corinthian; it was built in a large ſquare there, called the *forum romanum.*

Its baſe conſiſts of 12 ſtones of an enormous ſize, and it is raiſed on a ſocle or foot of eight ſteps. Within-ſide is a ſtair-caſe, illuminated with 44 windows. It is 140 foot high, which is 35 foot ſhort of the Antonine column; but the workmanſhip of the former is much more valued.

It is adorned from top to bottom with baſſo relievo's, repreſenting the great actions of that emperor aginſt the Dacæ.

Several learned men have explained the bas-reliefs of the *Trajan* column, and among others Ciaconius and Fabretti.—The late king of France, Lewis XIV. had models of all the bas-reliefs taken off in plaiſter of Paris.

TRAJECTORY of a comet, is its path or orbit, or the line it deſcribes in its motion. See Orbit.

This Hevelius, in his *Cometographia*, will have to be very nearly a right line; but Dr. Halley rather concludes it to be a very excentrical ellipſis. See Ellipsis.

Sir Iſaac Newton, in prop. 41. of his third book, ſhews how to determine the *trajectory* of a comet from three obſervations; and in his laſt propoſition, how to correct a *trajectory* graphically deſcribed. See Comet.

TRAIL-Board, in a ſhip, is a carved board on each ſide of her beak, which reaches from the main ſtem to the figure, or the brackets.--See *Tab. Ship. fig.* 2. *n.* 4. See alſo the article Ship.

TRAIN, the attendance of a great perſon, or the trail of a gown, or robe of ſtate.

In falconry, it denotes the tail of an hawk. See Tail.

Train is likewiſe uſed for the number of beats which a watch makes in an hour, or any other certain time. See Watch-*Work*, &c.

Train is alſo uſed for a line of gun-powder laid to give fire to a quantity thereof, in order to do execution, by blowing up earth, works, buildings, &c. See Gunpowder, Mine, &c.

Train, or Traile *of artillery*, includes the great guns and other pieces of ordnance belonging to an army in the field. See Gun, Cannon, Ordnance, &c. See alſo Artillery.

Train *Oil*, the oil procured from the blubber of whales, by boiling. See Oil, and Whale.

Train-*bands*, or Trained-*bands*, a name given to the militia of England. See Militia.

TRAINING *a load*, among miners, is the ſearching for and purſuing a vein of ore. See Vein.

TRAITOR. See the article Traytor.

TRAITTE. See the article Foreign *Traitte.*

TRAMBLING *of tin ore*, among miners, is the waſhing it very clean: which is done with a ſhovel, and in a frame of boards. See Tin.

TRAMEL, an inſtrument or device, ſometimes of leather, more uſually of rope, fitted to a horſe's legs, to regulate his motion, and form him to an amble. See Amble.

It is alſo taken in many places for an iron moveable inſtrument in chimnies, to hang pots over the fire.

Tramel-Net, * is a long net wherewith to take fowl by night in champain-countries, much like the net uſed for the low-bell both in ſhape, bigneſs and maſhes.

* The word comes from the French, *tremail*, formed of the Latin, *tremaculum*, or *tremaclum*; of *macula*, by reaſon it is compoſed of three rows of maſhes.

To uſe it, they ſpread it on the ground, ſo as the nether or further end, fitted with ſmall plummets, may lie looſe thereon: then the other part being bore up by men placed at the fore-ends, it is thus trailed along the ground. At each ſide are carried great blazing lights, by which the birds are raiſed: as they riſe under the net, they are taken. See Low-*Bell*.

TRAMONTANE, * or Tramontain, ſomething beyond, or on the further ſide, the mountains.

* The word is formed from the Italian, *tra*, of the Latin, *trans*, which ſignify *beyond*; and *mons* or *mont*, mountain.

The term is particularly applied by the Italian painters, to all ſuch as live on the other ſide the Alps, *i. e.* all out of Italy; as the Germans, Flemiſh, French, &c.

The French lawyers give the ſame title of *tramontane*, or *ultramontane* doctors to the Italian canoniſts, Gomez, Hoſtienſis, Panorm, &c. who go upon rules and maxims too favourable to the court of Rome, and contrary to thoſe of France, &c.

On the Mediterranean and in Italy, a north wind is called *tramontana*, a *tramontane wind.*

Some alſo call the pole ſtar, *tramontana.*—Hence the proverb, to *loſe the tramontane*; that is, to be out of one's aim, to be diſconcerted.

TRANCHE', or Trenche', is uſed by the French armoriſts, to expreſs that manner of partition called among us, *party per bend dexter*. See Party, and Bend.

A ſcutcheon is ſaid to be *tranché*, *cut*, when it is divided in two diagonally, the diviſion coming from the dexter angle of the chief to the ſiniſter angle of the point:—when it is divided contrarywiſe, it is ſaid to be *taillé*, or *party per bend ſiniſter*.

TRANGLE, in heraldry, the diminutive of a feſſe, commonly called a *bar*. See Bar, and Fesse.

TRANSACTION, Transactio, in the civil law, an accommodation of ſome buſineſs or diſpute between two parties, by a mutual and voluntary agreement or contract between them. See Accommodation, Compromise, Accord, &c.

Philoſophical Transactions, are a kind of journal of the principal things that come before the royal ſociety of London. See Journal, and Royal *Society*.

The *tranſactions* contain the ſeveral diſcoveries and hiſtories of nature and art, made by the members of the ſociety, or communicated by them from their correſpondents, with the ſeveral experiments, obſervations, &c. made by them, or tranſmitted to them, &c.

They were firſt ſet on foot in 1665 by Mr. Oldenburg, ſecretary of the ſociety, and continued by him till the year 1679. After his death Dr. Hook, the ſucceeding ſecretary, continued them under the title of *philoſophical collections*: but Dr. Grew, appointed to the ſame office in 1689, reſumed the former title of *philoſophical tranſactions*, which was retained by his ſucceſſor Dr. Plott, and ſubſiſts to this day.

They were publiſhed every month with great care by Mr. Oldenburg, and the firſt ſecretaries; but after Dr. Plott, they were frequently interrupted. In the year 1700 Dr. Sloan reſtored their regular publication monthly; in time they relapſed, and only came out once in two months; from that they fell to 3, 4, and 6 months. They were afterwards publiſhed more frequently and regularly by the care of Dr. Jurin; but are now returned into their former languiſhing ſtate.

TRANSCENDANT, or TRANSCENDENTAL, ſomething raiſed, or elevated beyond other things; or which paſſes and *tranſcends* the nature and circumſtances of other inferior beings, ſo as not to be intimately and eſſentially included under them.

The term is particularly applied to the object of metaphyſics, which conſiders being in general, or *tranſcendental* beings, as God and angels, and truths conſiſting in pure ſpeculation. See METAPHYSICS.

Logicians and metaphyſicians give the name *tranſcendental terms* to thoſe which are ſo general, and of a ſignification ſo extenſive and univerſal, that they paſs through all the categories, and agree to all kinds of things:—ſuch are the terms *ens*, *unum*, *verum*, *bonum*, *res*. See ENS, *&c.*

TRANSCENDENTAL *Art*, } See { ART.
TRANSCENDENTAL *Perfection*, } See { PERFECTION.

TRANSCENDENTAL *Quantities*, among ſchool-men. See the article QUANTITY.

TRANSCENDENTAL *Quantities*, among geometricians, are indeterminate ones; or ſuch as cannot be expreſſed or fixed to any conſtant equation.—Such is a *tranſcendental* curve, or the like. See TRANSCENDENTAL *Curve*, and CURVE.

M. Leibnitz has a diſſertation in the *acta erudit. Lipſ.* wherein he endeavours to ſhew the origin of ſuch quantities, *viz.* why ſome problems are neither plain, ſolid, nor ſur-ſolid, nor of any certain degree, but do *tranſcend* all algebraical equations. See PROBLEM.

He alſo ſhews how it may be demonſtrated without calculus, that an algebraic quadratrix for the circle or hyperbola is impoſſible: for if ſuch a quadratrix could be found, it would follow, that by means thereof any angle, ratio or logarithm, might be divided in a given proportion of one right line to another, and this by one univerſal conſtruction; and conſequently the problem of the ſection of an angle, or the invention of any number of mean proportionals, would be of a certain finite degree. See CIRCLE, QUADRATRIX, QUADRATURE, *&c.*

Whereas the different degrees of algebraical equations, and therefore the problem, underſtood in general of any number of parts of an angle or mean proportionals, is of an indefinite degree, and *tranſcends* all algebraical equations. See EQUATION.

TRANSCENDENTAL *Curve*, in the higher geometry, is ſuch a one as cannot be defined by any algebraic equation; or which, when expreſſed by an equation, one of the terms thereof is a variable quantity. See CURVE.

Theſe curves are the ſame with what Des Cartes, and after his example, ſeveral others, call *mechanical curves*, and which they would have excluded out of geometry; but Sir Iſaac Newton and M. Leibnitz are of another ſentiment. For, in effect, in the conſtruction of geometrical problems, one curve is not to be preferred to another, as it is defined by a more ſimple equation, but as it is more eaſily deſcribed than that other. See GEOMETRICAL *Line*.

And ſome of theſe *tranſcendental* or mechanical curves are found of greater uſe than all the algebraical ones together, except the circle. See MECHANICAL.

Add that M. Leibnitz, in the *acta eruditor. Lipſ.* gives us a kind of *tranſcendental* equations, whereby theſe *tranſcendental* curves are actually defined, and which are of an indefinite degree; that is, are not always the ſame in all the points of the curve.

Whereas algebraiſts uſe to aſſume ſome general letters or numbers for the quantities ſought, in theſe *tranſcendental* problems M. Leibnitz aſſumes general or indefinite equations for the lines ſought; *e. gr.* putting x and y for the abſciſs and ordinate, the equation he uſes for a line ſought, is $a+bx+cy+exy+fxx+gyy$, &c. $=0$. By the help of which indefinite equation, which in reality is finite, for it may always be determined how far ſoever it is neceſſary to raiſe it, he ſeeks the tangent; and that which reſults, comparing with the given property of tangents, he finds the value of the aſſumed letters a, b, c, &c. and thus defines the equation of the line ſought.

If the compariſon above-mentioned do not proceed, he pronounces the line ſought not to be an algebraical, but a *tranſcendental* one.

This ſuppoſed, he goes on to find the ſpecies of tranſcendancy: for ſome *tranſcendentals* depend on the general diviſion or ſection of a ratio, or upon the logarithms, others upon the arcs of a circle, and others on more indefinite and compound inquiries.

Here therefore beſides the ſymbols x and y, he aſſumes a third, as v, which denotes the *tranſcendental* quantity, and of theſe three forms a general equation for the line ſought, from which he finds the tangent according to the differential method, which ſucceeds even in *tranſcendental* quantities. What he finds, he compares with the given properties of the tangent, and ſo diſcovers not only the values of a, b, c, &c. but alſo the particular nature of the *tranſcendental* quantity.

And though it may ſometimes happen that the ſeveral *tranſcendentals* are ſo to be made uſe of, and theſe of different natures too one from another; alſo though there be *tranſcendents* or *tranſcendentals*, and a progreſſion of theſe *in infinitum*: yet we may be ſatisfied with the moſt eaſy and uſeful one, and for the moſt part may have recourſe to ſome peculiar artifices for ſhortening the calculus, and reducing the problem to as ſimple terms as may be.

This method being applied to the buſineſs of quadratures, or to the invention of quadratrices in which the property of the tangent is always given, it is manifeſt not only how it may be diſcovered, whether the indefinite quadrature may be algebraically impoſſible, but alſo how, when this impoſſibility is diſcovered, a *tranſcendental* quadratrix may be found; which is a thing which had not before been ſhewn. So that it ſeems that geometry is by this method carried infinitely beyond the bounds to which Vieta and Des Cartes brought it; ſince by this means a certain and general analyſis is eſtabliſhed, which extends to all the problems which are of no certain degree, and conſequently not comprehended within algebraical equations.

Again, in order to manage *tranſcendental* problems (where-ever the buſineſs of tangents or quadratures occurs) by a calculus, there is hardly any that can be imagined ſhorter, more advantageous or univerſal, than the differential calculus, or analyſis of indiviſibles and infinites.

By this method we may explain the nature of *tranſcendental* lines by an equation, *e. gr.* Let a be the arc of a circle, and x the verſed ſine: then will $a = \dfrac{\int dx}{\sqrt{2x-xx}}$ and if the ordinate of the cycloid be y, then will $y = \sqrt{2x-xx} + \dfrac{\int dx}{\sqrt{2x-xx}}$ which equation perfectly expreſſes the relation between the ordinate y and the abſciſſe x, and from it all the propeties of the cycloid may be demonſtrated.

Thus is the analytical calculus extended to thoſe lines which have hitherto been excluded, for no other cauſe, but that they were thought incapable of it. See GEOMETRICAL *Line*.

TRANSCOLATION, in pharmacy, the ſame with filtration, or percolation. See FILTRATION, *&c.*

TRANSCRIPT, a copy of any original writing, particularly that of an act, or inſtrument, inſerted in the body of another. See COPY, EXEMPLIFICATION, *&c.*

In this ſenſe, we ſay, *tranſcript of a fine*, &c. See FINE, DUPLICATE, *&c.*

TRANSCRIPTO *recognitionis factæ coram juſticiariis itinerantibus*, &c. is a writ for certifying a recognizance into chancery, taken before the juſtice in eyre. See RECOGNIZANCE.

TRANSCRIPTO *pedis finis levati mittendo in cancellariam*, is a writ for certifying the foot of a fine levied before juſtices in eyre, *&c.* into chancery. See FINE.

TRANSEAT, in the ſchools, *&c.* a term purely Latin, ſignifying, *let it paſs*, or ſuppoſe a propoſition to be true, without granting it. See HYPOTHESIS, LEMMA, *&c.*

Hence the proverb, *tranſeat*, *græcum eſt*, *non legitur*: the phraſe is ſaid to have taken its riſe from ſome ancient commentators, or gloſſographers of the civil law, who, not underſtanding Greek, paſſed over all the words that occurred in that language, without explaining them.

In the Roman chancery, a *nil tranſeat* is a kind of oppoſition made to the ſealing of a bull, or to the delivery of ſome other inſtrument, till the parties againſt whoſe intereſt it is directed, have been heard againſt it.

TRANSELEMENTATION, in the ſchools, a change of the elements or principles of one body into thoſe of another. See ELEMENT.

Such is that which Roman catholics contend for in the euchariſt, where the elements of bread and wine are changed into thoſe of fleſh and blood. See TRANSUBSTANTIATION.

Tranſelementation, where-ever it happens, is always allowed miraculous, or an effect beyond the ordinary powers of nature. See MIRACLE.

TRANSFER, in commerce, *&c.* an act whereby a perſon ſurrenders his right, intereſt or property in any thing moveable, or immoveable, to another.

The ſale or donation of an inheritance, *&c.* *transfers* the property, rights, *&c.* thereof.

The term is principally uſed in the commerce of ſtocks; for the aſſigning and making over ſubſcriptions or ſhares therein, to ſuch as purchaſe them of the proprietors. See SUBSCRIPTION.

In the South-Sea company, the Bank, Eaſt-India, *&c. transfers* are made, by eraſing the former proprietors names, and entering the ſtock under the name of the purchaſer, under his proper letter of the alphabet. See COMPANY, BANK, *&c.*

In order to a *transfer*, it is required the party bring another with him to ſwear he is the ſame perſon to whom the ſtock is entered. A counterfeit in this caſe is by act of parliament made a capital crime.

TRANSFIGURATION, among divines, that miraculous change wrought by Jeſus Chriſt, in preſence of St. Peter, St. James, and St. John, on mount Thabor, where he appeared in his glory, in the middle of Moſes and Elias. See the deſcription thereof in St. Matthew, chap. xvii.

The term is alſo applied to a feaſt held in the Romiſh church on the 6th of Auguſt, in commemoration of that miracle.

TRANSFORMATION, a metamorphoſis, or change of form. See METAMORPHOSIS, FIGURE, and FORM.

The chymiſts have been a long time ſeeking the *transformation* of metals, that is, their *tranſmutation*, or the manner of changing them into gold. See TRANSMUTATION.

Among the myſtics, by *transformation*, is underſtood a change of the contemplative ſoul, whereby it is in ſome meaſure deified or converted into the ſubſtance of God, and wherein it is, as it were, loſt and ſwallowed up in the divinity, ſo as not to perceive its own diſtinction from God.

The word *transformation* is very liable to be abuſed; and, in effect, the Quietiſts and Quakers have abuſed it. But many of the myſtics uſe it innocently enough; meaning no other by it than what St. Paul did when he ſaid, *Vivo ego, jam non ego, vivit vero in me Chriſtus.*

TRANSFORMATION is alſo ſometimes uſed for what we more properly call *tranſubſtantiation*. See TRANSUBSTANTIATION.

TRANSFUSION,* TRANSFUSIO, the act of pouring a liquor out of one veſſel into another. See DECANTATION.

* The word is compounded of the Latin prepoſition *trans, beyond, farther*, and *fundo, I pour.*

In the preparations of chymiſtry and pharmacy, there are frequent *transfuſions* of liquors, ſyrups, *&c.*

TRANSFUSION *of the Blood*, is particularly uſed for the letting out the blood of one animal, ſo as to be immediately received into the body of another. See BLOOD.

Dr. Lower is uſually accounted the inventor of this *transfuſion*, and the experiment ſaid to have been firſt publicly made by him at Oxford in 1665, and the deſcription thereof publiſhed in his excellent book *de Corde.*

Yet we are informed from good hands, that it had been propoſed at Paris in 1658; that another of our countrymen had had the idea before, and that it had been known in Germany ſeveral years.—It is certain there is a paſſage in Libavius, wherein the *transfuſion* is exactly deſcribed as ſince practiſed: it is true, he diſapproves of it; and only mentions it to ridicule it.

The uſe moſt naturally expected from the operation, is, that one animal may live of the blood of another; ſo that thoſe which want blood, or have corrupt, morbid blood, may be ſupplied from others with a ſufficient quantity, and of ſuch as is good and laudable.

However, it is certain the operation has no place in the preſent practice of phyſic; but whether that be the fault of the operation itſelf, or owing to the indolence and averſeneſs of people to run into new methods, we will not undertake to ſay.

The method of *transfuſing*, Dr. Lower gives us to the following effect: take up the carotid artery of the dog, or other animal whoſe blood is to be *transfuſed* into another of the ſame, or a different kind; ſeparate it from the nerve of the eighth pair, and lay it bare above an inch. Make a ſtrong ligature on the upper part of the artery; and an inch nearer the heart another ligature with a running knot, to be looſened and faſtened as occaſion requires. Draw two threads between the two ligatures; open the artery, put in a quill, and tie up the artery again upon the quill by the two threads, and ſtop the quill by a ſtick.

Then make bare the jugular vein of the other animal, for about an inch and half in length, and at each end make a ligature with a running knot; and in the ſpace between the two knots, draw under the veins two threads, as in the other. Open the vein, and put into it two quills, one into the deſcending part of the vein, to receive the blood from the other dog, and carry it to the heart: the other quill put into the other part of the jugular, towards the head, through which the ſecond animal's own blood is to run into diſhes. The quills thus tied faſt, ſtop them up with ſticks till there be occaſion to open them.

Things thus diſpoſed, faſten the dogs on their ſides towards one another, in ſuch manner, as that the quills may go into each other: then unſtop the quill that goes down into the ſecond dog's jugular vein, as alſo that coming out of the other dog's artery; and by the help of two or three other quills put into each other, as there ſhall be occaſion, inſert them into one another.

Then ſlip the running knots, and immediately the blood runs through the quills as through an artery, very impetuouſly. As the blood runs into the dog, unſtop the quill in the upper part of his jugular, for his own blood to run out at, though not conſtantly, but as you perceive him able to bear it, till the other dog begin to cry, and faint, and at laſt die.

Laſtly, take out both quills out of the jugular, tie the running knot faſt, and cut the vein aſunder, and ſew up the ſkin: the dog thus diſmiſſed, will run away as if nothing ailed him.

In the *Philoſophical Tranſactions* we have accounts of the ſucceſs of various *transfuſions* practiſed at London, Paris, in Italy, *&c.* Sir Edmund King *transfuſed* 49 ounces of blood out of a calf into a ſheep; the ſheep after the operation appearing as well and as ſtrong as before.

Mr. Coxe *transfuſed* 14 or 16 ounces out of a mangy into a ſound dog: the effect was, that no alteration was obſerved in the ſound dog, but the mangy one was cured.

M. Gayant *transfuſed* the blood of a young dog into the veins of an old one almoſt blind with age, and ſcarce able to ſtir; which yet, two hours afterwards, leaped and friſked about.

M. Denis *transfuſed* the blood of three calves into three dogs, which all continued briſk, and eat well as before.—The ſame perſon *transfuſed* the blood of four weathers into a horſe 26 years old, which thence received much ſtrength, and a more than ordinary appetite.

At St. Griffomi's at Udine, the blood of a lamb was *transfuſed* into the veins of a ſpaniel 13 years old, which had been quite deaf for three years, and ſo feeble as ſcarce to be able to walk at all.—After the operation he leaped from the table, and went about the houſe to ſeek his maſter.—Two days afterwards he ran up and down the ſtreets with other dogs; his ſtomach grew ſtrong, and he recovered his hearing.

TRANSGRESSION,* TRANSGRESSIO, an offence againſt ſome law; or a breach, or violation thereof. See VIOLATION, LAW, CRIME, SIN, *&c.*

* The word is compounded of *trans, beyond*, and *gradi, to go.*

The term is chiefly uſed in reſpect of the laws of God. In the doctrine of original ſin, all mankind are ſuppoſed to ſhare with Adam in the guilt of his firſt *tranſgreſſion*. See ORIGINAL *Sin.*

Moſes threatens the *tranſgreſſors* of his law with abundance of temporal puniſhments. See PUNISHMENT.

TRANSGRESSIONE, in our law, a writ uſually called a *writ* or *action of treſpaſs.* See TRESPASS.

Of this, Fitzherbert has two ſorts: one *vicountiel*, thus called becauſe directed to the ſheriff, and not returnable, but to be determined in the county.—Its form differs from that of the other, as wanting the words *quare vi & armis*, &c. See VICOUNTIEL.

The other is termed a *writ of treſpaſs*, and to be ſued in the Common-Pleas, and King's-Bench. See TRESPASS.

TRANSIENT *Action*, } See the articles { ACTION.
TRANSIENT *Air*, } { AIR.

TRANSIRE, in *ſtat. anno* 14 *Car.* II. *c.* 11. is uſed for a cuſtom-houſe warrant, or let-paſs—from the verb *tranſeo, I go forth.*

TRANSIT,* TRANSITUS, in aſtronomy, ſignifies the paſſage of any planet, juſt by, or over a fixed ſtar; and of the moon, in particular, covering or moving over any other planet. See STAR, and PLANET.

* The word comes from the Latin, *tranſire, to paſs over*; formed of *trans*, and *eo, I go beyond.*

Mercury and Venus, *&c.* in their *tranſits* over the ſun, appear like dark ſpecks. See MERCURY, and VENUS.

TRANSITION, in muſic, is when a greater note is broken into leſſer, to ſoften the roughneſs of a leap, by a gradual paſſage to the note next following. See PASSAGE.

This is commonly called the *breaking of a note.* See NOTE.

TRANSITION, in rhetoric, a kind of connexion in diſcourſe, whereby the ſeveral different parts and members thereof are joined, ſo as to conſtitute one regular whole. See DISCOURSE, PERIOD, *&c.*

Some place *tranſition* in the number of figures; others, with Quintilian, exclude it that rank. See FIGURE.

F. de Colonia makes two kinds of *tranſitions*; the one *perfect*, the other *imperfect.*

Perfect **TRANSITION**, is that wherein we briefly intimate what is ſaid, and what remains to be ſaid—as, *Now that we have ſpoke of war, there remains ſomething to be ſaid of peace.—Satis multa de turpitudine: dicam deinceps, quod propoſui, de periculo.—Uni epiſtolæ reſpondi: venio ad alteram.—Sed hæc vetera; illud recens: Cæſarem meo conſilio interfectum.*

Imperfect **TRANSITION**, is that wherein only one of theſe is expreſſed—as, *Let us now conſider the conſequences of*, &c.—*Poſtularet hic locus ut dicerem de—ſed finis ſit; neque enim præ lachrymis jam loqui poſſum; & hic ſe lachrymis defendi negat.*

TRANSITIVE, in grammar, an epithet given to ſuch verbs as ſignify an action which paſſes from the ſubject that does it, to, or upon, another ſubject which receives it. See VERB, and ACTION.

Under the head of verbs *tranſitive*, come what we uſually call verbs active and paſſive: other verbs, whoſe action does not paſs out of themſelves, are called *neuters*, and by ſome grammarians *intranſitives.* See NEUTERS.

In the Hebrew, the verb היה, *bajah*, in the Greek ειμι, and in the Latin, *ſum*, are verbs purely neuter or intranſitive; or, as the Latin and Greek grammarians more uſually expreſs it, verbs ſubſtantive, ſignifying the mere exiſtence of the thing, without the active or *tranſitive* conjugations.

TRANSITORY, in common law, ſtands oppoſite to local. See LOCAL.—Thus actions are ſaid to be *tranſitory* which may be laid in any county or place. See ACTION.

TRANSITORY *Choſe*, } See the articles { CHOSE.
TRANSITORY *Treſpaſs*, } { TRESPASS.

TRANSLATION,* the act of transferring or removing a thing from one place to another. See PLACE.

* The word is formed of *trans*, *beyond*, and *latio*, of *ferre*, *to carry*.

We ſay the *tranſlation* of a biſhop's ſee, a council, a ſeat of juſtice, a parliament; the *tranſlation* of the relicks of a ſaint; the *tranſlation* of the empire, &c.

The *tranſlations* of biſhops from one ſee to another, are prohibited by the council of Nice, which declares them null, and appoints the *tranſlated* biſhop to return to his former church.—The council of Sardica excludes *tranſlated* biſhops from communion. It had been obſerved, that no biſhop was ever removed from a greater church to a leſſer; and that thoſe who thus quitted their churches, only did it out of ambition or avarice.

This diſcipline was generally obſerved for 900 years; and the firſt inſtance of any *tranſlation* of note, was that of pope Formoſus, who was biſhop of Porto. One of his ſucceſſors took hold of this pretence to have him dug out of his grave; and a council, held ſoon after, forbad this *tranſlation* to be made a precedent.

However, the ſame church allowed of ſome legitimate cauſes of *tranſlations*; as, the apparent advantage of the church: under which pretence, *tranſlations* ſoon became ſo frequent, that for 500 or 600 years laſt paſt, they have been eſteemed a kind of common law. See BISHOP.

The *tranſlation* of a religious from one order to another, cannot be effected without the conſent of the pope: it is added, that it is not allowed to *tranſlate* from a ſeverer rule to a laxer one.

TRANSLATION is alſo uſed for the verſion of a book, or writing out of one language into another. See BOOK, VERSION, &c.

Tranſlators frequently endeavour to excuſe themſelves at the expence of their language; and aſk pardon for it, as if it were not rich and copious enough to expreſs all the force and beauties of the original.

Thus is the Engliſh tongue accuſed of the poverty and dryneſs which is in the *tranſlator*'s own genius; and the faults are charged on the former, which ſhould only lie at the latter's door. See ENGLISH.—The Italians have a proverb, *traduttore, traditore*.

TRANSMARINE, TRANSMARINUS, ſomething that comes from, or belongs to, the parts beyond ſea. See FOREIGN, EXOTIC, SEA, &c.

TRANSMIGRATION, the removal or tranſlation of a whole people into another country, by the power of a conqueror. See COLONY.

Some tranſlate the leading of the children of Iſrael captive into Babylon, the *tranſmigration* of the Iſraelites, &c. See MIGRATION.

TRANSMIGRATION is particularly uſed for the paſſage of a ſoul out of one body into another: the ſame with what we otherwiſe call METEMPSYCHOSIS.

The Siameſe, F. Tachard informs us, from a belief of the *tranſmigration* of ſouls into other bodies, forbear killing any beaſts; leſt, by that means, they ſhould diſpoſſeſs the ſouls of their deceaſed relations.

Ionic TRANSMIGRATION. See the article IONIC.

TRANSMISSION, in optics, &c. the act of a tranſparent body paſſing the rays of light through its ſubſtance, or ſuffering them to paſs; in which ſenſe the word ſtands oppoſed to reflection. See REFLECTION.

Tranſmiſſion is alſo frequently uſed in the ſame ſenſe with refraction, by reaſon moſt bodies, in *tranſmitting* the rays, do alſo refract them. See REFRACTION.

For the cauſe of *tranſmiſſion*, or the reaſon why ſome bodies *tranſmit*, and others reflect the rays, ſee TRANSPARENCY, and OPACITY.

The rays of light, Sir Iſaac Newton obſerves, are ſubject to fits of eaſy *tranſmiſſion* and each reflection. See RAY, and LIGHT.

TRANSMUTATION, the act of transforming or changing one nature into another. See TRANSUBSTANTIATION, and TRANSFORMATION.

The term is chiefly uſed in chymiſtry and medicine: it is greatly queſtioned, whether the *tranſmutation* of ſilver into gold, and of tin into ſilver, ſo much ſought by the chymiſts, be poſſible or not? See GOLD, &c.

The pureſt and ſubtileſt parts of the food are *tranſmuted* or aſſimilated into the proper ſubſtance of the body. For the manner how, ſee NUTRITION.

Nature, Sir Iſaac Newton obſerves, ſeems delighted with *tranſmutations*: he goes on to enumerate ſeveral kinds of *natural* *tranſmutations*; groſs bodies and light, he ſuſpects, may be mutually *tranſmuted* into each other; and adds, that all bodies receive their active force from the particles of light which enter their compoſition. See LIGHT, and FIRE.

For all fixed bodies, when well heated, emit light as long as they continue ſo; and again, light intermingles itſelf and inheres in bodies as often as its rays fall on the ſolid particles of thoſe bodies. See OPACITY.

Again, water, which is a fluid, volatile, taſteleſs ſalt, is by heat *tranſmuted* into vapour, which is a kind of air; and by cold into ice, which is a cold, tranſparent, brittle ſtone, eaſily diſſolvable; and this ſtone is convertible again into water by heat, as vapour is by cold. See WATER, VAPOUR, ICE, &c.

Earth, by heat, becomes fire; and by cold is turned into earth again: denſe bodies, by fermentation, are rarefied into various kinds of air; and that air, by fermentation alſo, and ſometimes without it, reverts into groſs bodies. See AIR, &c.

Quickſilver ſometimes puts on the form of a fluid metal; ſometimes it appears in ſhape of a pellucid, fragile ſalt, called *ſublimate*; ſometimes, of a pellucid, volatile, white, taſteleſs earth, called *mercurius dulcis*; by diſtillation it becomes vapour, and by agitation in vacuo, ſhines like fire, &c. See MERCURY, and PHOSPHORUS.

All bodies, beaſts, fiſhes, inſects, plants, &c. with all their various parts, grow and increaſe out of water, and aqueous and ſaline tinctures; and by putrefaction, all of them revert into water or an aqueous liquor again. See WATER.

Farther, water expoſed a while to the open air, puts on a tincture, which in proceſs of time has a ſediment and a ſpirit; and before putrefaction, yields nouriſhment both for animals and vegetables. See NUTRITION, and VEGETATION.

TRANSMUTATION, in alchymy, denotes the act of changing or exalting imperfect metals into gold or ſilver. See METAL, GOLD, &c.

This is alſo called the *grand operation*, and is to be effected with the philoſophers ſtone. See PPILOSOPHERS *Stone*.

Some alchymiſts hold, that the *tranſmutation* ſhould rather be called the *perfection* of imperfect metals; as holding all metals intended by nature to arrive equally at this perfection, inaſmuch as they are compoſed of the ſame matter; and that it is only the impurity of their matrices, that is, of the place wherein they are formed by nature, that has prevented their arriving thereat. See METAL.

The elixir being projected on any of thoſe metals, it is ſuppoſed to purge, and ſeparate the impure parts from the pure, and to join itſelf wholly to the mercury (which is the pure part) as being of the ſame nature. See PROJECTION.

Whether or no metals are *tranſmutable* into one another, is a point ſtrongly diſputed among the philoſophers; the alchymiſts ſtrenuouſly aſſerting the affirmative. See ALCHYMY.—Some metals, it is commonly allowed, may be changed into others; *e. gr.* iron into braſs or copper, and lead into tin; but Cardan and ſome others deny even this, and argue farther, that though iron and braſs, as being nearly alike in weight and tenacity, &c. provided their colour and hardneſs could be changed, might be converted into another, either really, or, at leaſt, apparently; yet would the *tranſmuting* or ripening of other metals into gold or ſilver be ſtill impoſſible; both as thoſe metals are all to be firſt calcined, after which they can never be brought again to their priſtine purity; and as there is a generation required, which is not the work of art, but nature.

Cardan *de Metall.* Lemery, Dickenſon, and others, give us accounts of the various impoſtures of Adepti in the buſineſs of *tranſmutation*; ſome, for inſtance, fixing mercury with verdigreaſe, and then heightening the colour with cadmia, turmeric, &c. But this, if tried with the coppel, all goes off in fumes; and, in effect, nothing produced this way ought to be adjudged true gold, unleſs it endure coppelling, cæmentation, purification, with antimony, and the depart. See PURIFICATION, ESSAYING, &c.

Add, that it muſt have the malleability, extreme ductility, and ſpecific gravity of gold, which is to water as 18 and half to 1. See WEIGHT.

The trick of *tranſmuting* cinnabar into ſilver is thus: the cinnabar being bruiſed groſsly, is ſtratified in a crucible with granulated ſilver, and the crucible placed in a great fire; and after due time for calcination, taken off: then the matter being poured out, is found to be cinnabar turned into real ſilver, though the ſilver grains appear in the ſame number and form as when they were put into the crucible; but the miſchief is, coming to handle the grains of ſilver, you find them nothing but light friable bladders, which will crumble to pieces between the fingers. Mr. Boyle, in his *Scept. Chymiſt.* tells us, that two friends of his did, by urging mercury in a ſkilfully managed fire, turn it almoſt weight for weight into water; but does not ſay what was the ſpecifick gravity of the produced water, nor of the remaining *untranſmuted* maſs of mercury.—He likewiſe aſſures us, that rain-water being diſtilled and re-diſtilled by a friend of his, near 200 times, did, after diſtillation, leave, at the bottom of the glaſs body, a conſiderable quantity of a white earth; and that more plentifully in the latter diſtillations than the former.

This he believed to be a certain quantity of water actually *tranſmuted* into earth; adding, that it was above twice as heavy ſpecifically as common water, and of ſo fixed a nature, that it lay a conſiderable time in a red-hot crucible, without loſing any thing of its weight, or emitting any ſmoak.

TRANSMUTATION, in geometry, denotes the reduction or change of one figure, or body into another of the ſame area, or ſolidity, but of a different form; as a triangle into a ſquare, a pyramid into a parallelepiped, *&c.* See FIGURE, *&c.*

TRANSMUTATION, in the higher geometry, is uſed for the converting a figure into another of the ſame kind and order, whoſe reſpective parts riſe to the ſame dimenſions in an equation, admit the ſame tangents, *&c.* See TRANSFORMATION.

If a rectilinear figure be to be *tranſmuted* into another, it is ſufficient that the interſections of the lines which compoſe it be transferred, and lines drawn through the ſame in the new figure. See REDUCTION.

If the figure to be *tranſmuted* be curvilinear, the points, tangents, and other right lines, by means whereof the curve line is to be defined, muſt be transferred. See CURVE.

TRANSMUTATION *of Plants.* See the articles SEED, and DEGENERATION.

TRANSOM, among builders, the piece that is framed acroſs a double light window. See WINDOW.

TRANSOM, among mathematicians, denotes the vane of a croſs-ſtaff; or a wooden member fixed acroſs it, with a ſquare whereon it ſlides, *&c.* See VANE, and CROSS-*Staff*.

TRANSOM, in a ſhip, is a piece of timber which lies athwart the ſtern, between the two faſhion pieces, directly under the gun-room-port.—See *Tab. Ship. fig.* 2. *n.* 109.

TRANSPARENCY, *Diaphaneity*, in phyſics, a quality in certain bodies, whereby they give paſſage to the rays of light. See LIGHT, and DIAPHANEITY.

The *tranſparency* of natural bodies, as glaſs, water, air, *&c.* ſome have imputed to the great number, and ſize of the pores or interſtices between the particles of thoſe bodies: but this account is exceedingly defective; for the moſt ſolid and opake body in nature, we know, contains a great deal more pores than it does matter; a great deal more, ſure, than is neceſſary for the paſſage of ſo infinitely fine and ſubtile a body as light. See PORE.

Ariſtotle, Des Cartes, *&c.* place *tranſparency* in the rectitude or ſtraightneſs of the pores; by means of which, ſay they, the rays are enabled to make their way through, without ſtriking againſt the ſolid parts, and being reflected back again: but this account, Sir Iſaac Newton ſhews, is lame; the quantity of pores in all bodies being ſufficient to tranſmit all the rays that fall on them, howſoever thoſe pores be ſituated with reſpect to each other.

The cauſe, then, why all bodies are not *tranſparent*, muſt not be aſcribed to their wanting rectilinear pores; but either to the unequal denſity of the parts, or to the pores being filled with ſome foreign matters, or their being quite empty; by means of which, the rays in paſſing through, undergoing a great variety of reflections and refractions, are perpetually diverted this way and that, till at length falling on ſome of the ſolid parts of the body, they are extinguiſhed and abſorbed. See RAY, and REFLECTION, *&c.*

Thus cork, paper, wood, *&c.* are opake; when as glaſs, diamonds, *&c.* are *tranſparent:* the reaſon is, that in the neighbourhood of parts equal in denſity, ſuch as thoſe of glaſs, water, diamond, *&c.* are with reſpect to each other; the attraction being equal on every ſide, no reflection or refraction enſues; but the rays which entered the firſt ſurface of the bodies, proceed without interruption quite through the body; thoſe few only excepted which chance to meet with the ſolid parts. But in the neighbourhood of parts, that differ much in denſity, ſuch as the parts of wood and paper are both in reſpect of themſelves, and of the air or the empty ſpace in their pores; as the attraction will be very unequal, the reflections and refractions muſt be very great; and therefore the rays will not be able to make their way through ſuch bodies, but will be perpetually deflected, and at laſt quite ſtopped. See OPACITY.

TRANSPARENT *Column.* See the article COLUMN.

TRANSPIRATION, the inſenſible, or almoſt inſenſible paſſage of an excrementitious matter through the pores of the ſkin; called alſo *perſpiration.* See PERSPIRATION.

There are an infinity of theſe *tranſpiratory* pores in the ſkin; the moſt conſiderable whereof are the orifices of the ducts ariſing from the miliary glands. See PORE, and SKIN.

The cauſe of *tranſpiration* is the circulation and heat of the blood.—Inſenſible *tranſpiration* is found very much to exceed all the ſenſible evacuations put together. Sanctorius even ſhews, in his *Medicina Statica*, that a perſon loſes more in one day by *tranſpiration*, than by all the other outlets in fifteen. He adds, that if the food taken by one day weigh eight pounds, the *tranſpiration* will be five of them.

Cold prevents *tranſpiration*, by its conſtringing the pores of the ſkin, and thickening the liquors, circulating in the cutaneous glands: heat, on the contrary, augments *tranſpiration*, both by its opening the excretory ducts of the glands, and by its increaſing the fluidity and velocity of the humours. See COLD, *&c.*

M. Dodart, from a number of experiments made for 33 years together, aſſures us, that we *tranſpire* much more in youth than in age.—In ſome perſons, the *tranſpiration* is ſo copious, that they void but very little of the coarſer excrements, though they eat very heartily.

Tranſpiration is abſolutely neceſſary in the animal œconomy, to purify the maſs of blood, and diſcharge it of a number of uſeleſs heterogeneous particles which might corrupt it. Hence it is, that upon a ſtoppage of the uſual *tranſpiration*, there ariſe ſo many indiſpoſitions, particularly fevers, agues, itch, *&c.*

Tranſpiration is alſo of uſe to the organ of feeling, in that it prevents the papillæ of the ſkin from being dried, either by the air, or by the continual touches of external bodies.

TRANSPIRATION is alſo uſed by ſome authors, for the ingreſs or entrance of the air, vapours, *&c.* through the pores of the ſkin into the body. See AIR.

Cardan, by this kind of *tranſpiration*, accounts for the prodigy of a woman, whoſe daily urines weighed 27 pounds; though all the foods ſhe took, both dry and liquid, did not exceed four pounds.—Dr. Baynard ſuſpects ſome ſuch *tranſpiration* to be the caſe in hydropical perſons. See DROPSY.

TRANSPLANTATION, in agriculture and gardening, the act of removing trees or plants from the places where they were ſowed or bred up, and planting them in other. See TREE, PLANTING, REPLANTING, *&c.*

In the **TRANSPLANTING** *of foreſt-trees*, care is to be taken to preſerve the roots, and even the fine hairs or filaments thereof, with the earth that ſticks thereto; theſe filaments being the mouths that ſuck the nouriſhment, and transfuſe it to the tree. See ROOT, and VEGETABLE.

The pits or foſſes, into which trees are *tranſplanted*, ſhould be left open for ſome time before-hand, that the rain, froſt, and ſun may diſſolve the compacted ſalt, render the earth friable, and qualify it for nouriſhing the tree.—The ſame may be done, in ſome meaſure, by burning ſtraw in the new pits, and drenching the mould with water in dry ſeaſons, and by enriching the ground with manure. See MANURING.

Pliny was of opinion, no tree ſhould be removed under two, or above three years old. Cato would have none *tranſplanted* leſs than five fingers in diameter: but we are, now, able to *tranſplant* trees of all ages and ſizes, without danger.

To *tranſplant* old trees was reckoned ſo difficult, that *veterem arborem tranſplantare* is become a proverb for a difficult enterprize; and yet we are informed of a grove of 600 coco-trees of 80 years growth, and 60 foot high to the loweſt bough, *tranſplanted* by count Maurice, to his paradiſe of Friburg: and a great perſon in Devonſhire, Mr. Evelyn tells us, *tranſplanted* oaks, as big as twelve oxen could draw, to ſupply a defect in an avenue.

For the *tranſplantation* of grown trees, Mr. Evelyn gives the following method, as practiſed with good ſucceſs by the lord Fitzharding: chooſe trees about the thickneſs of a man's thigh; remove the earth from about them; cut through all the ſide roots, till the tree may be, by force, brought down on one ſide; ſo that the tap-roots may be conveniently come at to be cut off with the ax: then redreſs the tree, and let it ſtand covered with the mould from which it was looſened, till next year, or longer; and by that time it will have drawn new tender roots fit for *tranſplanting*, and may be taken up at a fit ſeaſon.

Otherwiſe, for very large trees, before the hard froſts come on, make a trench about the tree, at ſuch diſtance from the ſtem, as you judge ſufficient for the root; dig ſo deep, as almoſt to undermine it; place blocks, and quarters of wood to ſuſtain the earth, and caſt in as much water as may fill the trench, or ſufficiently wet it, unleſs the ground were very moiſt before. Thus let it ſtand till ſome hard froſt bind it firmly to the roots, and then convey it to its new ſtation, which may be preſerved from freezing, by placing ſtore of warm litter in it: ſo cloſe the mould the better to the ſtraggling fibres, and place the earth taken out of the pit about the root of the new-planted tree.

The common rules for *tranſplanting* are, 1°. The lighter the ſoil is, the deeper are the trees to be planted. 2°. If the ſoil be gravel, or ſand, mix clay with it, and *vice verſa.* 3°. The beſt ſeaſon is either October or February; in warm, moiſt, clear weather. 4°. The large roots to be abated, to prevent the neceſſity of digging too deep: but the ſmall fibrous ones to be ſpared. 5°. In taking up the trees to obſerve how the roots grow, and in *tranſplanting* to diſpoſe them in the ſame order, and place the tree to the ſame aſpect. 6°. To defend young trees after *tranſplantation*, both from the wind and ſun, till the roots be fixed, and they begin to ſhoot. 7°. If the ſoil you *tranſplant* into be good, do not top the trees, but lop all the boughs to one ſingle one, the moſt upright and promiſing among them: but if the ſoil be poor, top them, and, when they are ſhot out again, lop off all the branches to one. See PRUNING.

TRANSPLANTING *of fruit-trees.*—After a ſummer's growth of fruit ſeedlings in the ſeminary, ſuch are pulled up as are above a foot high, and *tranſplanted* into a nurſery; the reſt to be left in the ſeed-plot till another year. See NURSERY.

When drawn up, the ſprigs are to be cut off, from about the top, the ſtrings from the roots, and the extremities, both of the top, that it may not run too faſt upwards, and of the tap or heart-root, that it may not paſs directly downwards; leſt it go beyond the good ſoil. The holes or pits to be ſo deep, as that the plants may ſtand ſomewhat deeper in the ground, than when in the ſeed-plot; cloſe the mould about them, and if it be a dry time, water them the firſt day, and cover the ſoil with old fern.

Mr. Bradley gives us a new method of *tranſplanting* trees of all kinds and ages with ſafety, either while they are in bloſſom, or with fruit upon them, thus: the holes to receive the trees, are to be prepared before the trees are taken up; and the earth which comes out of the holes to be made very fine, and put into large tubs and mixed with water, till it be about the conſiſtence of thin batter. Then the holes wherein the trees are to be planted, are to be filled with this thus-tempered earth, before the earthy parts have time to ſettle.

The advantage hereof is, that the trees thus planted have their roots immediately incloſed and guarded from the air; and the warm ſeaſon of the year diſpoſing every part of the tree for growth and ſhooting, it will loſe very little of its vigour.—In winter it does not ſucceed.

The ſame author adds, that in conſideration of the circulation of the ſap, it is as neceſſary to preſerve the veſſels of trees intire, as thoſe in animal bodies: and therefore, in *tranſplanting* trees in the ſummer ſeaſons, it is not proper to cut off any of the branches, or wound any of the veſſels, till they have renewed their roots, which it is of abſolute neceſſity to wound in *tranſplanting* them. For the wounded roots, he has provided a plaiſter of a mixture of gums, to prevent the canker and rot, and promote their healing.

TRANSPLANTATION, in natural magic, is uſed for a method of curing diſeaſes, by transferring them from one ſubject to another; much in vogue among certain chymical, or rather ſympathetical phyſicians. See SYMPATHETIC.

This *tranſplantation* is effected, either by the uſe of a certain medium, called on that account a *magnet*; or without, by ſimple contact.

The firſt kind, which is that moſt properly called *tranſplantation*, is when the patient's excrement being mixed up with earth, the diſeaſe is *tranſplanted* into a vegetable, ariſing from a ſeed ſown in the ſaid compoſt; or, when the parings of the nails, *e. gr.* of a gouty perſon, are incloſed in an auger-hole made in a plant, particularly an oak.

Here the patient's excrement is the magnet, and the vital ſpirit of the plant ariſing from the ſeed is the mumia which the magnet receives; and the caſe is the ſame, in the parings of the nails, and the vital ſpirit of the oak. See MUMIA.

The ſecond kind of *tranſplantation*, properly called *approximation*, is, when a finger ſeized with a panaris, or whit-low, is cured by rubbing in a cat's ear, which is ſuppoſed to receive the pain.

In this caſe, the ſound ſubject receives the vital ſpirits, unites with them, and corrects their morbific ſtate: and, as certain diſeaſes are got by approximation, the infected ſpirits of a diſeaſed body, inſinuating themſelves into a ſound one, and thus infecting the ſame: ſo they are cured by approximation; when the ſpirits of a diſeaſed perſon entering a ſound body, the latter corrects and retrieves the morbific ſtate of the former.

Tranſplantation, by means of the magnet, is of five kinds, *viz.* *inſemination*, *implantation*, *impoſition*, *irroration*, and *ineſcation*; each whereof ſee under its proper article, INESCATION, IMPLANTATION, &c.

TRANSPORT-*Ship*, is a veſſel whereon to convey proviſions, warlike ſtores, ſoldiers, &c. See VESSEL.

TRANSPORTATION, the act of conveying, or carrying a thing from one place or country to another. See EXPORTATION.

In matters of commerce, *tranſportation* is of equal import with re-exportation, *viz.* the taking up of commodities in one foreign ſtate or kingdom, bringing them hither, and paying duties for them; and then conveying them into ſome other foreign ſtate: by which it is diſtinguiſhed from *importation*, and *exportation*, where the commodities are either carried originally out of, or brought finally into, our own kingdom.

Our *tranſportation* or re-exportation of wool, butter, hides, tallow, herrings, beef, and ſalmon, which we *tranſport* from Ireland to other provinces, being the concerns of our merchants, and paying duties to his majeſty, have been reckoned at 300,000 *l. per annum.*

It would be tedious to enumerate the value of our *tranſportations* from Denmark, Sweden, Spain, Portugal, the Streights, Turkey, Guinea, &c. the moſt conſiderable is from the Eaſt-Indies. In the infancy of that trade, *viz.* in the year 1613, of pepper only, beſides what we conſumed at home, we *tranſported* in one year to other countries, after it had paid duty here, to the value of 200,000 *l.* and of late years our exportation of what we bring from thence, after we have ſupplied ourſelves, is computed at 500,000 *l.* ſterling. See NAVIGATION, and COMMERCE.

TRANSPORTATION is alſo a kind of puniſhment, or, more properly, an alleviation or commutation of puniſhment, for criminals convicted of felony, who, for the firſt offence, unleſs it be an extraordinary one, are ordinarily *tranſported* to the plantations, there to bear hard labour for a term of years, within which if they return, they are executed without farther trial. See FELONY, PUNISHMENT, &c.

TRANSPOSITION, in algebra, the bringing any term of an equation over to the other ſide. See TERM.

Thus, if $a+b=c$, and you may make $a=c-b$; *b* is ſaid to be *tranſpoſed*. See EQUATION.

TRANSPOSITION, in grammar, a diſturbing or diſlocating of the words in a diſcourſe; or a changing of their natural order of conſtruction, to pleaſe the ear, by rendering the contexture more eaſy, ſmooth, and harmonious. See HYPERBATON.

A *tranſpoſition*, which renders the ſenſe perplexed, is vicious.—The conſtruction of the ancient languages being much more artful than that of the modern ones, allowed of much greater and more frequent *tranſpoſitions*. The Engliſh, French, &c. ſcarce ever allow of them but in oratory and poetry; in which caſes they ſerve to give a force and energy to the diſcourſe or the verſe, and to prevent their languiſhing. See CONSTRUCTION.

TRANSPOSITION, in muſic, is a changing of the notes of a piece of muſic, or the ſhifting a ſong from its former ſituation, to ſet it either higher or lower, or in another octave.

Of this there are two kinds; the firſt with reſpect to the *clef*, the ſecond with reſpect to the *key*.

TRANSPOSITION *with reſpect to the clef*, conſiſts in changing the places or ſeats of the notes or letters among the lines and ſpaces; but ſo as that every note is ſet at the ſame letter. See CLEF.

This is done either by removing the ſame clef to another line, or by uſing another clef, but with the ſame ſignature, by reaſon the piece is ſtill in the ſame key. See KEY.

The practice is eaſy in either caſe: in the firſt, you take the firſt note at the ſame diſtance above or below the clef-note, in its new poſition as before; and all the reſt of the notes in the ſame relations or diſtances from one another; ſo that the notes are all ſet on lines and ſpaces of the ſame name.

In the ſecond, or ſetting the muſic to a different clef, it is to be obſerved, the places of the three clef-notes are invariable in the ſcale, and are to one another in theſe relations, *viz.* the mean a 5th above the baſs, and the treble a 5th above the mean. Now to *tranſpoſe* to a new clef, *e. gr.* from the treble to the mean, where-ever that new clef is ſet, we ſuppoſe it the ſame individual note, in the ſame place of the ſcale, as if that piece were that part in a compoſition to which this new clef is generally appropriated; that ſo it may direct to the ſame notes we had before *tranſpoſition*: now, from the fixed relations of the three clefs in the ſcale, it will be eaſy to find the ſeat of the firſt *tranſpoſed* note; and then all the reſt are to be ſet at the ſame mutual diſtances they were at before. See SCALE.

Suppoſe, *e. gr.* the firſt note of a ſong be *d*, a 6th above the baſs-clef; where-ever that clef is placed, the firſt note muſt be the greater 2d above it, becauſe a greater 2d above the mean is a greater 6th above the baſs-clef, the relation of thoſe two being a 5th.—So that the firſt note will ſtill be the ſame individual *d*.

The uſe of this *tranſpoſition* is, that if a ſong being ſet with a certain clef, in a certain poſition, the notes go far above or below the ſyſtem of five lines; they may, by the change of the place of the ſame clef in the particular ſyſtem, or by taking a new clef, be brought more within the compaſs of the lines.

TRANSPOSITION *from one key to another*, is a changing of the key, or a ſetting all the notes of the ſong at different letters, and performing it, conſequently, in different notes upon an inſtrument. See KEY.

The deſign hereof is, that a ſong which being begun in one note, is too high or low, or otherwiſe inconvenient for a certain inſtrument, may be begun in another note, and from that carried on in all its juſt degrees and intervals.

The clef and its poſition here remain the ſame; and the change is of the notes themſelves, from one letter, and its line or ſpace, to another.

In the former *tranſpoſition*, the notes were expreſſed by the ſame letters, but both removed to different lines, and ſpaces: in this, the letters are unmoved, and the notes of the ſong transferred to, or expreſſed by other letters, and conſequently ſet upon different lines and ſpaces, which, therefore, requires a different ſignature of the clef.

TRANSUBSTANTIATION, TRANSUBSTANTIATIO, in theology, the converſion or change of the ſubſtance of the bread and wine in the euchariſt into the body and blood of Jeſus Chriſt. See EUCHARIST.

Tranſubſtantiation, taken in its general and literal ſenſe, implies any change of one ſubſtance into another; thus the change of Moſes's rod into a ſerpent; of the waters of the Nile into blood; of Lot's wife into a pillar of ſalt, were preter-natural *tranſubſtantiations*: and the change of the food we eat, into the ſubſtance of our bodies, is a natural *tranſubſtantiation*. See Substance.

But the word, in its proper and technical ſenſe, is reſtrained to the miraculous change which the Romiſh church holds is wrought in the ſacrament, by the conſecration of the prieſt.

One of the great articles of that church, rejected by the reformed, is that of *tranſubſtantiation*; the latter maintaining the *tranſubſtantiation* to be only figurative, and the former real. See Presence, &c.

The reformed interpret *eſt*, *is*, in the text *hoc eſt corpus meum*, *this is my body*, by *ſignificat*; q. d. *this ſignifies my body*: but the council of Trent ſtand up ſtrenuouſly for the literal ſenſe of the verb: thus in *can.* 1. *ſeſſ.* 13. of that council, it is expreſly decreed, that in *tranſubſtantiation*, the body and blood of our Lord Jeſus Chriſt are truly, really, and ſubſtantially under the ſpecies of bread and wine.

It is added, that by *truly*, we mean *properly*, and not only by ſignification, as if the euchariſt were no more than a ſign of the body and blood of Jeſus Chriſt; that by *really*, we mean *in fact*, and not only in figure, as if the euchariſt were only a figure and repreſentation of the body and blood of the Saviour of the world; and that by *ſubſtantially*, we mean *in ſubſtance*, and not only in virtue and energy.—Thus is *truly* oppoſed to a ſimple ſign, *really* to a figure, and *ſubſtantially* to energy, or virtue.

TRANSUMPTION, Transumptio, in the ſchools, a ſyllogiſm by conceſſion or agreement, uſed where a queſtion propoſed is transferred to another, with this condition, that the proof of this latter ſhall be admitted for a proof of the former.

Thus Ariſtotle, in his book *de cœlo*, undertaking to ſhew that all the ſtars are round, transfers the queſtion to the moon, and proves her rotundity from her increaſing and waining, ſuppoſing it a thing admitted by his opponents, that the ſtars are all alike.

TRANSVERSALIS, in anatomy, a name given to ſeveral muſcles, &c. in reſpect of their ſituation, progreſs, &c. as the

Transversalis *abdominis*, a muſcle which lies under the obliqui, and ariſes from the cartilago xiphoides, from the extremities of the falſe ribs, from the tranſverſe apophyſis of the vertebræ of the loins, is fixed to the inner ſide of the ſpine of the ilium, and inſerted in the os pubis and linea alba.—See *Tab. Anat.* (Myol.) *fig.* 2. *n.* 29. *fig.* 7. *n.* 39.

This, with the obliqui, unites its tendons, as it approaches the linea alba, and is the only muſcle that is cut in the operation of the bubonocele: it has a fine and thin membrane that cloſes exactly its ring or hole through which the veſſels paſs. See Obliquus.

Transversalis *colli*, is a part of the *tranſverſalis dorſi*, which ſome divide into three, *viz.* the ſacer, ſemi-ſpinatus, and *tranſverſalis colli*.

It ariſes from the os ſacrum, and from all the tranſverſe proceſſes of the vertebræ of the loins, back and neck, except the two firſt, and is inſerted by ſo many diſtinct tendons into all their ſuperior ſpines: it moves the whole ſpine obliquely backwards.

Transversalis *pedis placentini* comes from the bone of the metatarſus, that ſuſtains the toe next the little toe, and paſſing acroſs the other bones, is inſerted into the os ſeſamoides of the great toe: its uſe is to bring all the toes cloſe to one another.

Transversalis *penis* ariſes from the iſchium juſt by the erectores, and runs oblique to the upper part of the bulb of the urethra.

It helps to preſs the veins upon the back of the penis, againſt the os pubis, which is the cauſe of erection. See Erection.

Transversalis *Lumborum*, } See { Sacer.
Transversalis *Femoris*, } See { Quadratus.

Transversalis is alſo a name given a ſuture of the cranium, becauſe of its tranſverſing or croſſing the face from one ſide to the other. See Suture.

It ariſes at one of the leſſer angles of the eye, and paſſing along the bottom of its orbit, and the root of the noſe, terminates in the other leſſer angle.

TRANSVERSE, ſomething that goes acroſs another from corner to corner. See Traverse.

Thus bends and bars in heraldry are *tranſverſe* pieces or bearings. See Bend.—The diagonals of a parallelogram or a ſquare are *tranſverſe* lines. See Diagonal.

Lines which make interſections with perpendiculars, are alſo called oblique or *tranſverſe* lines. See Perpendicular, Oblique, &c.

Transverse *axis*, or *diameter*, called alſo the *firſt* or *principal axis*. See Axis, Diameter, and Latus *tranſverſum*.

The *tranſverſe* axis of an ellipſis, is the longer axis, or that which *traverſes* it lengthwiſe, in contra-diſtinction from the conjugate one. See Ellipsis, and Conjugate.

The *tranſverſe* axis of an hyperbola, is the line DK, *Tab. Conics*, *fig.* 17. cutting the curve in the points D and K. See Hyperbola.

Transversum *Latus*, } See { Latus.
Septum **Transversum**, } See { Septum.

Transverse *Muſcles*, in anatomy, are certain muſcles ariſing from the *tranſverſe* proceſſes of the vertebræ of the loins. See Transversalis, and Vertebræ.

TRANTERY, in ſome cuſtoms, denotes the money ariſing by amerciaments of ale-ſellers and victuallers for breaking the aſſize of bread and ale; particularly at Luſton, and other manours in Herefordſhire. See Assise.

TRAPEZIUS. See Cucullaris.

TRAVERSE, or Transverse, ſomething that goes athwart another, *i. e.* croſſes, and cuts it obliquely. See Transverse.

Traverse is particularly uſed for a piece of wood or iron placed tranſverſely, to ſtrengthen and fortify another: ſuch are thoſe uſed in gates, windows, &c.

To plane a board againſt the grain, is alſo called among joiners, &c. to *traverſe* it.

Traverse, in gunnery, ſignifies to turn or point a piece of ordnance, which way one pleaſes upon her platform. See Ordnance, Cannon, &c.

The laying or removing a piece of ordnance or a great gun, in order to bring it to bear, or lie level with the mark, is alſo called *traverſing the piece*. See Gunnery, &c.

Traverse, in fortification, denotes a trench with a little parapet, ſometimes two, one on each ſide, to ſerve as a cover from the enemy that might come in flank.

Traverſes are ſometimes covered over-head with planks, and loaded with earth.—They are very commodious for ſtopping an enemy's way, and to prevent being enfiladed. They likewiſe make a good defence in a dry foſs, in making the parapet on the ſide next the oppoſite flank.

Traverse, in a wet foſs, is a ſort of gallery, made by throwing ſauciſſons, joyſts, faſcines, ſtones, earth, and other things into the foſs, over-againſt the place where the miner is to be put to the foot of the wall, in order to fill up the ditch, and make a paſſage over it. See Gallery.

Traverse alſo denotes a wall of earth or ſtone raiſed acroſs a work which is commanded, to cover the men.

Traverse alſo ſignifies any retrenchment, or line fortified with faſcines, barrels or bags of earth, or gabions. See Retrenchment.

Traverse, in navigation, is the variation or alteration of a ſhip's courſe, occaſioned by the ſhifting of the winds, currents, &c. See Course.

Traverſe ſailing is uſed when a ſhip having ſet ſail from one port towards another whoſe courſe and diſtance from the port ſailed from is given or known, is, by reaſon of contrary winds, or other accidents, forced to ſhift and ſail on ſeveral courſes, which are to be brought into one courſe, to learn, after ſo many turnings and windings, the true courſe and diſtance made from the place ſailed from, and the true point or place where the ſhip is; that ſo the wind coming fair, it may be known how to ſhape a courſe for the place intended. See Sailing.

This may be performed geometrically two ways: the firſt, by drawing new meridians, through the extremity of every courſe, parallel to the firſt meridian, or north and ſouth line at firſt made, and ſetting off every courſe with a ſweep of 60, as if it were a queſtion in plain ſailing. You may alſo let fall perpendiculars to every new meridian, from the point that the ſhip ſailed to upon that courſe, by which you have the courſe, diſtance, difference of latitude, and departure to every courſe.

To illuſtrate this by an example: a ſhip being bound for a port diſtant 120 miles N. E. ½ E. ſails S. S. E. 30 miles, then N. E. by 40, then E. by N. 25, then N. N. E. 44; it is required to find the courſe and diſtance made good, and alſo the courſe and diſtance to the port bound for?

Draw the line HK (*Tab. Navigation*, *fig.* 17.) at pleaſure for a meridian, or north and ſouth line, and therein aſſume a point, as A, for the port ſailed from; then with 60 of the chords, and one foot in A, draw the arch Lm, upon which ſet off two points (becauſe the courſe is S. S. E.) from L to m, and draw the line Am, upon which ſet off the diſtance 30, from A to B; then is the ſhip at B: thus letting fall the perpendicular BK, AK 27° 7′ is the difference of latitude, and BK 11° 5′, the departure for the firſt courſe.

For the ſecond courſe, with the diſtance KB, draw the parallel BN, and thereby with the chord 60, as before, ſet off the ſecond courſe and diſtance, N. E. by N. 40, from B to C, and let fall the perpendicular CL, then is the ſhip at C, the difference of latitude upon that courſe is BL 33 : 3, and departure CL 22 : 2.

Proceed in the ſame manner for the third courſe, with the parallel CO, ſet off E. by N. 25, from C to D, and draw the line DP, from which ſet off the laſt courſe, N. N. E. 44, then is your ſhip at E.

Since then the ſhip came from A, and is now at E, the line AE meaſured on the ſame equal parts upon which all the other diſtances were taken, will be found 91 miles, and the arch RQ meaſured on the rhumbs, five points, *viz.* N. E. by E. ſo that the ſhip is now 91 miles N. E. by E. from the port ſailed from.

To find her courſe and diſtance to the port bound for, ſet off 4 half points upon the arch RQ from R to S, and from A through S draw the line ASF; upon which ſet off 120, the diſtance from the port ſailed from to the port bound for, from A to F; then is F the port bound for: now the port bound for being at F, and the ſhip being but at E, the line EF meaſured on the ſame equal parts that the reſt was taken from, will be found to be 31, and the arch TV meaſured on the chords, is 35° 12′, or N. E. by N. ſomewhat eaſterly, *&c.*

This method is uſeful, where the courſes tend generally one way, without interſecting one another; but if they often croſs, it is beſt to have recourſe to the ſecond method, which is without new meridians.

In order to this, obſerve how many points are between the point next to be laid down, and the point oppoſite to the courſe laſt laid down; for that is the point for laying down: then, with the chord of 60, and one foot in the point the ſhip is laſt come to, deſcribe an arch; upon which ſet off the points found by the abovesaid rule, and through that draw the line for the next courſe, *&c.* For an example:

Draw a north and ſouth line, as in the former, as the line RM, *fig.* 17. *n.* 2. in which aſſume a point, as at A, for the port ſailed from; then from A ſet off the firſt courſe and diſtance, *viz.* N. N. W. 68, from A to B; and for the ſecond courſe, with the chord of 60, and one foot in B, draw the arch TW, upon which to ſet off the next courſe S. S. W. 70, obſerve the rule above delivered, *viz.* to take the number of points between the point oppoſite to the laſt courſe ſailed, and the point you are next to ſail on. The reaſon of which rule is this: if from A to B your courſe be N. N.W. then back from B to A, muſt needs be S. S. E. the oppoſite point; and then if you were to ſail S. by E. it muſt be one point to the ſouthward of that S. S. E. line; if ſouth, it is two points, and conſequently the next courſe being S. S.W. you are to ſet off 4 points, upon which ſet off 70 miles, from B to C, and then is your ſhip at C: for the third courſe, if from B to C be S. S.W. then from C to B is N. N. E. but the next courſe being E. half N. the points between N. N. E. and E. half N. are five points and an half, and therefore with the chord of 60, and one foot in C, draw the arch XY, upon which ſet off five points and an half from X to Y, and through Y draw the line CD, upon which ſet off 90 miles from C to D: then is your ſhip at D.

After the ſame manner lay down all the reſt, as DE, which is W. N.W. half N. 70, then EF ſouth 25, then FG, E. half S. 45; then laſtly GH, ſouth 30, which is the laſt courſe.

Thus your ſhip being at H, and the port ſailed from at A, the line AH 28 miles, is the diſtance made good; and the angle at A is four points, *viz.* S. E. but the port intended for, being S. W. 55, ſet it from A to K, and the ſhip being at H, the line HK 62 miles, is the diſtance from the ſhip to the port bound for; and the courſe is found by meaſuring the angle at H 71° 48′, or W. S.W. more than a quarter weſterly, *&c.*

To work a TRAVERSE *by the tables of difference of latitude and departure.*—This is the principal uſe thoſe tables are intended for; and the way of working a *traverſe* hereby, is equal to the beſt for exactneſs, and ſuperior in point of expedition.

Make a little table with ſix columns, the firſt for the courſe, the ſecond for the diſtance, the third for the northing, the fourth for the ſouthing, the fifth for the eaſting, the ſixth for the weſting. Then find the difference of the latitude and the departure to every courſe, and ſet them in their proper columns; as where the courſe is northerly, ſet the difference of the latitude under northing, or in the north column; and where the courſe is ſoutherly, ſet the difference of latitude in the ſouth column.

Again, where the courſe is eaſterly, ſet the departure in the eaſt column, and when weſterly, ſet it in the weſt column; then adding up each column by itſelf, ſubtract the north and ſouth columns, the leſſer from the greater, the remainder is the northing or ſouthing made good. Alſo ſubtract the eaſt and weſt columns, the leſſer from the greater, the remainder is the eaſting or weſting made good; then have you the difference of latitude and departure given, to find the courſe and diſtance.

In the firſt example above ſpecified, the firſt courſe is S. S. E. 30 miles, or two points 30 miles; for which I find the difference of latitude 27 : 7. Now the courſe being between ſouth and eaſt, I place my difference of latitude in the ſouth column, and my departure 11 : 5, in the eaſt column, leaving the north and weſt columns blank.

Then for the ſecond courſe N. E. by N. or three points 40 miles, my difference of latitude 33 : 3, is to be placed in the north column, and the departure 22 : 2, in the eaſt column, becauſe the courſe is between the north and eaſt.

Then the third courſe being E. by N. or ſeven points 25 miles, I place my difference of latitude 4 : 9, in the north column, and departure 24 : 5, in the eaſt column.

And ſo for the fourth courſe N. N. E. or two points 44 miles, I place my difference of latitude 40 : 6, in the north column, and my departure 16 : 8, in the eaſt column; then adding up each column, the ſum of the northing column is 78 : 8, and the ſum of the ſouthing column is 27 : 7, which ſubtracted from the northing 78 : 8, the remainder 51 : 1, is the difference of latitude made good, which is northing, becauſe the northing was the greater number.

Again, the ſum of the eaſting column is 75 : 0, which, becauſe there is no weſting to ſubtract from it, is the eaſting made good. Thus you have the northing 51 : 1, and the eaſting 75 : 0 given, to find courſe and diſtance; and though you cannot find in the table the exact number of 51 : 1, and 75 : 0 together, yet find the neareſt you can, which is 75 : 4, and 50 : 9, over which at the top you find 34 degrees for the courſe, which is N. E. by N. 0° 15′ eaſterly, and the diſtance 91 miles.

TRAVERSE, in law, denotes the denial of ſome matter of fact, alledged to be done in a declaration, or pleadings; upon which the other ſide coming and maintaining that it was done, iſſue is joined for the cauſe to proceed to trial. See ISSUE, and TRIAL.

The formal words of a *traverſe* are in the law French, *ſans ceo*, in Latin, *abſque hoc*, and in Engliſh, *without that*, &c.

An anſwer, ſays Weſt, (ſpeaking of bills in chancery) is that which the defendant pleadeth or ſaith in bar to avoid the plaintiff's bill or action, either by confeſſion and avoiding, or by denying and *traverſing* the material parts thereof. A replication is the plaintiff's reply to the defendant's anſwer, which muſt affirm and purſue his bill, and confeſs and avoid, deny or *traverſe* the defendant's anſwer.

A plea is nought which neither *traverſes* nor confeſſeth the plaintiff's title, *&c.* Every matter of fact alledged by the plaintiff, may be *traverſed* by the defendant, but not matter of law, or what is part matter of law, and part matter of fact; nor may a record be *traverſed*, as this is not to be tried by a jury.

If a matter be expreſly pleaded in the affirmative, which is expreſly anſwered in the negative, no *traverſe* is neceſſary, there being a ſufficient iſſue joined: alſo where the defendant hath given a particular anſwer in his plea, to all the material points contained in the declaration, he need not take a *traverſe*; for that when the thing is anſwered, there needs no further trial.

TRAVERSE *of an indictment or preſentment*, is the contradicting or denying ſome chief point of it, and taking iſſue thereon. See INDICTMENT, and PRESENTMENT.—Thus, in a preſentment againſt a perſon for a highway overflowed with water, for default of ſcouring a ditch, *&c.* he may either *traverſe the matter*, by alledging that there is no highway, or that the ditch is ſufficiently ſcoured; or he may *traverſe the cauſe*, *viz.* by alledging that he hath not the land, or that he and they whoſe eſtate, *&c.* have not uſed to cleanſe the ditch.

TRAVERSE *of an office*, is the proving that an inquiſition made of lands or goods is defective, and untruly made. See OFFICE, and INQUISITION.

No perſon ſhall *traverſe* an office, unleſs he can make to himſelf a good right and title: and if one be admitted *to traverſe* an office, this admiſſion of the party to the *traverſe*, ſuppoſes the title to be in him, or elſe he had no cauſe of *traverſe*.

TRAVERSE is ſometimes uſed in heraldry, for a partition of an eſcutcheon, of the figure repreſented in *Tab. Herald. fig.* 90. which they blazon parti per pal, *traverſe*, argent and gules.

TRAVERSE *Tyles*. See the article TYLE.

TRAVESTY, or TRAVESTI, a term which ſome late authors have introduced into poetry: it is originally French, being a participle of the word *traveſtir*, to diſguiſe one's ſelf, or to appear in maſquerade.—Hence *traveſty* comes to be applied to the diſfiguring of an author, or the tranſlating him into a ſtyle and manner different from his own; by which means it becomes difficult to know him. See PARODY.

G. Battiſta Lalli has *traveſtied* Virgil, or turned him into Italian burleſque verſe. Scarron has done the ſame in French, and Cotton and Phillips in Engliſh verſe. See BURLESQUE.

Caſtalio is charged with having *traveſtied* the bible, by reaſon of the difference of air and ſtyle between his verſion and the original.

TRAUMATICS, ΤΡΑΥΜΑΤΙΚΑ, *Vulneraries*, or medicines good for the healing of wounds. See VULNERARY, and AGGLUTINANT, HEALING, CONSOLIDATION, *&c.*

TRAYL-BASTON, or TRAIL-BASTON.—Edward I. in his 32d year, ſent out a new writ of inquiſition, under this denomination, againſt the intruders on other mens lands, who, to oppreſs the right owner, would make over their lands to great men; againſt batterers hired to beat men, breakers of peace, raviſhers, incendiaries, fighters, falſe aſſiſors, and other malefactors: which inquiſition was ſo ſtrictly executed, and ſuch fines taken, that it brought in a world of treaſure to the king.

Hence alſo *juſtices of trayl-baſton*, a denomination given to the judges appointed to execute this commiſſion, either by reaſon of their ſevere and ſummary way of proceeding, or becauſe a ſtaff was delivered to them as the badge of their office, and the offenders were dragged before this juriſdiction.

TRAYTOR, Traitor, Traditor, a betrayer of his king and country, or one guilty of high treaſon. See Treaſon, and Traditores.

TRAYTEROUS, or Traiterous *Poſition*, is particularly underſtood of a tenet, which ſome formerly held, of the legality of taking arms by the king's authority againſt his perſon, and thoſe commiſſioned by him: which is condemned by ſtatute 14 Car. II. c. 3.

TREACLE, in pharmacy, *&c.* See Theriaca.

Treacle *Water*, *Aqua Theriacalis.* See Water.

TREASON, Treachery, the act or crime of infidelity to one's lawful ſoveraign. See Traytor.

Treaſon, in our laws, is of two ſorts, *high* and *petty*.

High Treason, or Treason *paramount*, is an offence committed againſt the ſecurity of the king or kingdom, whether by imagination, word or deed.—Such are, to compaſs or imagine the death of the king, queen, or prince; or to deflour the king's wife, or his eldeſt daughter unmarried, or his eldeſt ſon's wife, or to levy war againſt the king in his realms, to adhere to his enemies, counterfeit his great ſeal, or money, to kill the king's chancellor, treaſurer, juſtices of either bench, juſtices in eyre, of aſſize, or of oyer and terminer, being in their place during their office, diminiſhing or impairing current money: ſaying that the king is a heretic or papiſt, or intends to introduce popery, *anno* 13 Car. II.

It is a maxim, that *in majori proditione, omnes ſunt principales*, there are no acceſſaries in *high treaſon*, all are principals. See Accessary, and Principal.

Alſo, that *voluntas non reputabitur pro facto, niſi in cauſa proditionis*, the will is never taken for the deed in any caſe, but that of *high treaſon*.

Though ſome *high treaſons* are much more heinous than others, yet the puniſhment appointed by law is the ſame in all (clipping and coining only excepted) which is, that the traitor be laid upon a hurdle or ſledge, drawn to the gallows, there hanged, but cut down while alive, the entrails pulled out and burnt before the criminal's face, then his head and quarters cut off, and impaled where the king ſhall judge meet.—Add to this, that he forfeits all his lands and goods whatever to the king, his wife loſes her dowry, his children their nobility, and all right of inheriting.

Even an ideot, or lunatic, though judged incapable of moſt crimes, ſhall be puniſhed as a traitor, if he go about to kill the king.

For Petit or *Petty* Treason, ſee Petty *Treaſon.*

This kind gives forfeiture of lands by eſcheat to the lord of the fee. See Escheat.

There is alſo mention made of *accumulative* and *conſtructive treaſon*, in the ſtatute 14 Car. II.

Miſpriſion of Treason. See the article Misprision.

TREASURE, *Theſaurus*, θησαυρος, a ſtore or ſtock of money in reſerve. See Treasurer, and Treasury.

Treasure-*Trove*, q. d. *treaſure found*, in law, is when money, gold, ſilver, plate, or bullion, is found in the ground, in any place, and none knows to whom it belongs.

This ſhould naturally fall to the finder, but particular nations have made particular proviſions for it.—The Jews gave it the proprietor of the place where it was found: the Roman juriſprudence was various with regard hereto; ſometimes it was given to the maſter of the grounds, ſometimes to the finder, and ſometimes it was adjudged to the public treaſury.

In France and England the general uſage is to have ſuch *treaſure* ſequeſtered to the king, unleſs where the benefit thereof is expreſsly granted or made over by the king to ſome other, as the lord of the manour.

In ſome places in France, it is divided into three parts, one for the king, one for the proprietor of the land, and one for the finder.

Briton ſays, it is every ſubject's part, as ſoon as he hath found any *treaſure* in the earth, to make it known to the coroner of the county, *&c.*

The puniſhment for concealing *treaſure* found in England, is impriſonment and fine; but if any mine of metal be found in any ground, it always appertains to the lord of the ſoil, except it be a mine of gold or ſilver, which anciently always belonged to the king, in whoſe ground ſoever it were found: but by an act of parliament, the king now hath only the præemption.

TREASURER, an officer to whom the treaſure of a prince or corporation is committed to be kept, and duly diſpoſed of in payment of officers, and other expences. See Treasury.

Of theſe there is a great variety.—His majeſty of Great Britain, in quality of elector of Brunſwic, is *arch-treaſurer* of the Roman empire. See Arch-Treasurer.—In the ſtates of Poland are two *grand treaſurers*, that of the kingdom of Poland, and that of the dutchy of Lithuania.

In England the principal officers under this denomination are the *lord high treaſurer*, the *treaſurer of the houſhold, treaſurer of the navy*, of *the wardrobe*, of *the king's chamber*, &c. See Chamberlain, *&c.*

Anciently we had likewiſe a *treaſurer of the exchequer, treaſurer of war*, &c.—In the Romiſh countries the title *treaſurer* is alſo given ſomewhat abuſively to an eccleſiaſtic, who has the keeping of the relicks, and the charters and archives of a church or monaſtery. See Archives, *&c.*

This dignity ſucceeds, in ſome meaſure, to that of the ancient deacons, who had the like charge in the primitive church. See Deacon.

Lord High Treasurer *of England*, is the third great officer of the crown; under whoſe charge and government is all the king's revenue kept in the exchequer. See Revenue, and Exchequer.

He receives the office by delivery of a white ſtaff to him from the king, and holds it during the king's pleaſure: anciently he received it by delivery of the golden keys of the treaſury.

He has the check of all the officers any way employed in collecting impoſts, cuſtoms, tributes, or other revenues of the crown. He has the gift of all the cuſtomers, comptrollers and ſearchers places in all the ports of London, and the nomination of the eſcheators in every county. See Custom-*Houſe*, &c.

He alone, or others in commiſſion with him, letteth leaſes of all the crown lands, gives warrants to certain perſons of quality to have their wine cuſtom-free, *&c.*

The ancient ſalary was 383*l.* but of late is ſaid to have been 8000*l.* The office of lord *treaſurer* is now in commiſſion. See Treasury.

Under Treasurer *of England.* See Under-*Treaſurer.*

Treasurer *of the houſhold*, is an officer who, in the abſence of the lord ſteward, has power, with the comptroller and other officers of the green cloth, and the ſteward of the Marſhalſea, to hear and determine treaſons, felonies and other crimes committed within the king's palace. See Houshold, Green-*Cloth*, &c.

Treasurer *of the Navy*, is an officer who receives money out of the exchequer, by warrant from the lord high *treaſurer*, or the lords commiſſioners executing that place, and pays all charges of the navy, by warrant from the principal officers of the navy. See Navy.

TREASURY, the place wherein the revenues of a prince are received, preſerved, and diſburſed.

In England, the *treaſury* is a part of the exchequer, by ſome called the *lower exchequer*. See Exchequer.

The officers of his majeſty's *treaſury*, or the lower exchequer, are the lord treaſurer, a chancellor, a ſecretary, two chamberlains, an auditor, four tellers, a clerk of the pells, uſhers of the receipt, a tally-cutter, *&c.* See each officer under his proper article, Chancellor, Teller, Tally, *&c.*

At Rome, under the emperors, there were two kinds of *treaſuries*, the one called *ærarium*, wherein the monies deſtined to ſupport the charges of the government were kept; the other *fiſcus*, wherein were preſerved thoſe intended for the particular ſubſiſtance of the emperor and his court. In effect the ærarium belonged to the people, and the fiſcus to the prince. See Ærarium, and Fiscus.

We have ſtill a reſemblance of this difference among us, but it is confounded in France, *&c.* where the king diſpoſes abſolutely of the public treaſure, *&c.*

Lords of the Treasury.—In lieu of one ſingle director and adminiſtrator of his majeſty's revenues, under the title of lord high treaſurer; it is frequently thought proper to put that office in commiſſion, *i. e.* to appoint ſeveral perſons to diſcharge it with equal authority, under the title of lords commiſſioners of the *treaſury*. See Treasurer.

TREAT, in our old law-books, ſignifies as much as *taken out*, or *withdrawn*.—Thus a juror was challenged, becauſe he could not diſpend 40*l.* and therefore was *treat* by the ſtatute, or diſcharged. *Old. Nat. Br.* See Juror, *&c.*

TREATISE, Tractatus, a ſet diſcourſe in writing on any ſubject. See Tract.

A *treatiſe* is ſuppoſed more expreſs, formal, and methodical, than an eſſay; but leſs ſo than a ſyſtem. See Essay, *&c.*

TREATY, a covenant between ſeveral nations; or the ſeveral articles or conditions ſtipulated and agreed upon between ſoveraign powers. See Alliance.

There are *treaties* of peace, of marriage, of confederacy, of neutrality, of capitulation, and of commerce and navigation. See Peace, Confederacy, *&c.*

The celebrated *treaties* are thoſe of Nimeguen, of Munſter, of the Pyreneans, of Weſtphalia, of Riſwick, of Utrecht, of Hanover, of Vienna, *&c.*

Treaties of commerce are uſually followed by various tarifs, to adjuſt the duties of exportation and importation of merchandizes into the reſpective dominions of the contracting powers.

The laſt *treaty* of peace, commerce, navigation, *&c.* between England and France, was ſigned at Utrecht the 1ſt of April 1713, and conſiſts of 39 articles, moſt whereof are regularly executed between the two nations, only ſome of the more particular ones cannot yet be executed, by reaſon of ſome difficulties in the tarifs. See Tarif.

Guarantee of a Treaty. See the article Guarantee.

TREBELLIANICA, or Trebellian *Fourth*, in the Roman juriſprudence, a right belonging to an heir inſtituted by teſtament.—If the teſtator, after appointing a full and general heir, ſpent and diſpoſed of all his effects in legacies; or if he went *ultra dodrantem*, beyond three fourths thereof, in that caſe the heir was allowed to retrench and detain one fourth part of the legacies to his own uſe.—This was called the *Trebellianica*.

In like manner, if the teſtator charged his heir with a feoffment of truſt, and to reſtore the inheritance to another; in that caſe, the heir might likewiſe retain a fourth of the whole ſucceſſion, that the quality of heir might not be rendered wholly vain and fruitleſs.

TREBLE, in muſic, the higheſt or acuteſt of the four parts in ſymphony, or that which is heard the cleareſt and ſhrilleſt in a concert. See MUSIC, GRAVITY, and SYMPHONY.

In the like ſenſe we ſay, a *treble* violin, *treble* hautboy, *&c.* See VIOLIN, *&c.*

In vocal muſic, the *treble* is uſually committed to boys and girls.—Their part is the *treble*. See PART.

The *treble* is divided into firſt or higheſt *treble*, and ſecond or baſe *treble*.—The half *treble* is the ſame with the counter-tenor. See HARMONY.

TREBUCHET, TREBUCHETUM, a tumbrel, or cucking-ſtool. See CUCKING-STOOL.

TREDECILE. See the article ASPECT.

TREDDLE, or TREADLE, *Chalaza*, in natural hiſtory. See the articles CHALAZA, and EGG.

TREE, *Arbor*, the firſt and largeſt of the vegetable kind, conſiſting of a ſingle trunk, out of which ſpring forth branches and leaves. See VEGETABLE, *&c.*

Standards, or TREES *in full air*, are ſuch as naturally riſe a great height, and are not topped.—For the choice of *trees* of this kind to be tranſplanted out of a nurſery, Quintiney recommends us to ſuch as are ſtraight, ſix foot high at leaſt, and five or ſix inches thick at bottom, and three or four at top; the bark pretty ſmooth and ſhining, as a token of their youth, and of the good ſoil they grew in. See TRANSPLANTATION, NURSERY, *&c.*

Dwarf TREES, are ſuch as are kept low, and never ſuffered to have above half a foot of ſtem.—Theſe are uſed to be kept vacant or hollow in the middle, that the branches ſpreading round about the ſides may form a kind of round bowl or buſh. See DWARF.

Wall TREES, are thoſe whoſe branches are ſtretched out, and nailed againſt walls. See WALL, and ESPALIER.

For dwarf and wall *trees*, ſuch are to be choſe out of the nurſery for tranſplantation, as are ſtraight, and conſiſt of a ſingle ſtem, and a ſingle graft, rather than two or three grafts in ſeveral branches: their thickneſs at bottom ſhould be two or three inches.

Fruit TREES, are ſuch as bear *fruit*. See the article FRUIT.

Timber TREES, are thoſe whoſe trunks are tall and ſtraight, whereof beams, maſts, *&c.* are uſed to be made. See TIMBER.

Coniferous TREES, are thoſe whoſe fruit is of a conical figure, as the pine, fir, larch, *&c.*—Theſe are alſo called *reſiniferous*, by reaſon coniferous *trees* are generally covered with a bark that abounds in reſin. See RESIN.

Mr. Ray, and other authors, ſpeak of ſeveral *trees* of prodigious bulk.—The jeſuit d'Acoſta, in his hiſtory of the Indies, *lib.* 4. *c.* 3. mentions a hollow *tree* at Tlacocharaya, three leagues from Gauxa in New Spain, nine fathom within-ſide near the ground, and ſixteen without-ſide. He adds, that it is under this *tree* the barbarians aſſemble to perform their religious ceremonies, dance round their idols, *&c.*—Herrera mentions another, which ſixteen men, joining hands, cannot fathom.—F. Kircher, in his *Latium*, p. 50, affirms, he has ſeen a *tree* near Gonzano, which would lodge a whole family of 25 perſons in its cavity. The common people have a tradition, that it was planted by Auguſtus.

In the Indies there are very large foreſts conſiſting only of a ſingle *tree*, whoſe branches falling to the ground, take root, and put forth new *trees*: the fig *tree* and paretuvier are of this kind.

M. Lonvillers mentions *trees* in Peru, one part of whoſe branches produce fruit one half the year, and the other part the other half.—In China is a *tree* which bears tallow, whereof that nation make their candles. See TALLOW.

There are two or three very remarkable phænomena in the growth of *trees*, which have eſcaped the obſervation of the naturaliſts of all ages, except thoſe of our own: theſe are the perpendicularity of their trunks or ſtems, to the horizon, and the paralleliſm of their tufts to the ſpot of earth they grow on. An account of each, ſee under the articles PERPENDICULARITY, and PARALLELISM.

For the planting, tranſplanting, ſemination, pruning, felling, grafting, ſhrowding, barking, *&c.* of *trees*; ſee the reſpective articles, PLANTING, TRANSPLANTING, SEMINATION, PRUNING, ENGRAFTING, *&c.*

Mr. Ray diſtinguiſhes the *trees* and ſhrubs of our native growth in England, into, I. Such as *have their flower disjoined, and remote from the fruit*:—which are,

1°. *Nuciferous* TREES, or ſuch as bear nuts: as the walnut *tree*, the hazle-nut *tree*, the beech, the cheſnut, and the common oak. See NUT.

2°. *Coniferous* TREES, or ſuch as bear a ſquammous or ſcaly fruit, of a conical figure, and a woody or hard ſubſtance, in which are many ſeeds; which, when they are ripe, the cone opens or gapes in all its ſeveral cells or partitions, and lets them drop out: of this kind are the Scotch firs, male and female; the pine, which, in our gardens is called the Scotch fir; the common alder *tree*, and the birch *tree*.

3°. *Bacciferous* TREES, or ſuch as bear berries; as the juniper and yew *tree*. See BACCIFEROUS.

4°. *Lanigerous* TREES, or ſuch as bear a woolly, downy ſubſtance: as the black, white, and trembling poplars, willows, and oſiers of all kinds. See LANUGO, TOMENTUM, *&c.*

5°. TREES *which bear their ſeeds* (having an imperfect flower) *in leafy membranes and caſes*: as, the horn-beam, or hard-beam, called in ſome places the horn-beech.

II. Such as *have their fruits and flowers contiguous*; which are either with the flower placed on the top of the fruit, or adhering to the baſe or bottom of the fruit.

Of the former kind, ſome are *pomiferous*, as apples and pears; and ſome *bacciferous*, as the ſorb or ſervice *tree*, the white or haw-thorn, the wild roſe, ſweet-brier, currants, the great bilberry-buſh, honey-ſuckle, ivy, *&c.*

The latter kind are either ſuch as *have their fruit moiſt and ſoft when ripe*, as—1°. *Pruniferous* ones, whoſe fruit is pretty large and ſoft, with a ſtone in the middle; as the black thorn or ſloe *tree*, the black and white bullace *tree*, the common wild cherry, the black cherry, *&c.* See the article PRUNIFEROUS.

2°. *Bacciferous* TREES, as the ſtrawberry *tree* in the weſt of Ireland, miſletoe, water elder, the dwarf a large laurel, the viburnum or way-faring *tree*, the dogberry *tree*, the ſea black thorn, the berry-bearing elder, the privet, barberry, common elder, the holly, the buckthorn, the berry-bearing heath, the bramble, and the ſpindle *tree* or prickwood.

Or ſuch as *have their fruit dry when ripe*; as the bladder-nut *tree*, the box *tree*, the common elm and aſh, the maple, the gaule or ſweet willow, common heath-broom, dyers weed, furze or gorſe, the lime *tree*.

Heart of a TREE, See HEART,
Paralleliſm of rows of TREES, See PARALLELISM.

Diana's TREE, *arbor Dianæ*, among the chymiſts, is a kind of metalline vegetation, which after a long proceſs ſhoots out into branches, with the appearance of leaves, and even flowers. See ARBOR.

TREE *of Mars*, *arbor Martis*, is another very ſingular vegetation, firſt diſcovered accidentally by the younger Lemery. See ARBOR.

Dormant TREE, See DORMANT,
Roof TREES, See ROOF.

TREFOIL. See the article TRIFOLIUM.

TREMOR, TREMBLING, in medicine, a diſeaſe nearly akin to a convulſion, wherein there is ſomething of a convulſive motion or ſhaking, accompanying a voluntary or natural motion. See CONVULSION, and PARALYSIS.

A *tremor* is frequently found to ariſe upon the more violent paſſions, particularly anger, gluttony, venery, *&c.* but this is accidental and tranſitory.

A *tremor* is ſometimes apt to degenerate into other worſe diſeaſes, *viz.* palſey, apoplexy, lethargy, ſpaſmus, *&c.* In old men it is incurable. See TREPIDATION.

The medicine commonly made uſe of in *tremors*, and other nervous diſtempers, by the name of *palſey drops*, is no other than compound ſpirit of lavender. The moſt ſucceſsful way of uſing it, is by taking 30 or 40 drops twice or thrice a day, dropt on loaf ſugar or a little bread. It is ſuppoſed, that by this way the moſt ſpirituous and efficacious parts make their way directly by the nerves of the palate, *&c.* without undergoing the courſe of the circulation, as it is ſaid to do when taken in a liquid vehicle.

TREMOR *of the heart*. See the article PALPITATION.

TRENCH, a ditch cut, or dug in the ground, to drain off the waters in a meadow, a moraſs, or the like; or to divert the courſe of a river. See DITCH, *&c.*

Many of the bogs in Ireland have been drained, and made good ground, by only digging *trenches* around them.

TRENCHES, in fortification, are ditches which the beſiegers cut to approach more ſecurely to the place attacked; whence they are alſo called *lines of approach*.—See *Tab. Fortif. fig.* 21. *n.* 11, &c. See alſo DITCH, APPROACH, COUNTERTRENCH, *&c.*

They ſay, *mount the trenches*, that is, go upon duty in them. —To *relieve the trenches*, is to relieve ſuch as have been upon duty there. See MOUNTING.

The enemy is ſaid to have *cleared the trenches*, when they have driven away, or killed the ſoldiers who guarded them.

Tail of the TRENCH, is the place where it was begun. See TAIL.—And the *head* that to which it was carried. See HEAD, and ATTACK.

Trenches are of ſeveral ſorts, according to the nature of the ſoil: if the adjacent territory be rocky, the *trench* is only an elevation of bavins, gabions, wool-packs, or epaulements of earth, caſt round about the place—but where the ground may be

TRAYTOR, TRAITOR, TRADITOR, a betrayer of his king and country, or one guilty of high treaſon. See TREASON, and TRADITORES.

TRAYTEROUS, or TRAITEROUS *Poſition*, is particularly underſtood of a tenet, which ſome formerly held, of the legality of taking arms by the king's authority againſt his perſon, and thoſe commiſſioned by him: which is condemned by ſtatute 14 Car. II. c. 3.

TREACLE, in pharmacy, *&c.* See THERIACA.

TREACLE *Water*, *Aqua Theriacalis.* See WATER.

TREASON, TREACHERY, the act or crime of infidelity to one's lawful ſoveraign. See TRAYTOR.

Treaſon, in our laws, is of two ſorts, *high* and *petty*.

High TREASON, or TREASON *paramount*, is an offence committed againſt the ſecurity of the king or kingdom, whether by imagination, word or deed.—Such are, to compaſs or imagine the death of the king, queen, or prince; or to deflour the king's wife, or his eldeſt daughter unmarried, or his eldeſt ſon's wife, or to levy war againſt the king in his realms, to adhere to his enemies, counterfeit his great ſeal, or money, to kill the king's chancellor, treaſurer, juſtices of either bench, juſtices in eyre, of aſſize, or of oyer and terminer, being in their place during their office, diminiſhing or impairing current money: ſaying that the king is a heretic or papiſt, or intends to introduce popery, *anno* 13 Car. II.

It is a maxim, that *in majori proditione, omnes ſunt principales*, there are no acceſſaries in *high treaſon*, all are principals. See ACCESSARY, and PRINCIPAL.

Alſo, that *voluntas non reputabitur pro facto, niſi in cauſa proditionis*, the will is never taken for the deed in any caſe, but that of *high treaſon.*

Though ſome *high treaſons* are much more heinous than others, yet the puniſhment appointed by law is the ſame in all (clipping and coining only excepted) which is, that the traitor be laid upon a hurdle or ſledge, drawn to the gallows, there hanged, but cut down while alive, the entrails pulled out and burnt before the criminal's face, then his head and quarters cut off, and impaled where the king ſhall judge meet.—Add to this, that he forfeits all his lands and goods whatever to the king, his wife loſes her dowry, his children their nobility, and all right of inheriting.

Even an ideot, or lunatic, though judged incapable of moſt crimes, ſhall be puniſhed as a traitor, if he go about to kill the king.

For Petit or *Petty* TREASON, ſee PETTY *Treaſon.*

This kind gives forfeiture of lands by eſcheat to the lord of the fee. See ESCHEAT.

There is alſo mention made of *accumulative* and *conſtructive treaſon*, in the ſtatute 14 Car. II.

Miſpriſion of TREASON. See the article MISPRISION.

TREASURE, *Theſaurus*, θησαυρὸς, a ſtore or ſtock of money in reſerve. See TREASURER, and TREASURY.

TREASURE-*Trove*, q. d. *treaſure found*, in law, is when money, gold, ſilver, plate, or bullion, is found in the ground, in any place, and none knows to whom it belongs.

This ſhould naturally fall to the finder, but particular nations have made particular proviſions for it.—The Jews gave it the proprietor of the place where it was found: the Roman juriſprudence was various with regard hereto; ſometimes it was given to the maſter of the grounds, ſometimes to the finder, and ſometimes it was adjudged to the public treaſury.

In France and England the general uſage is to have ſuch *treaſure* ſequeſtered to the king, unleſs where the benefit thereof is expreſsly granted or made over by the king to ſome other, as the lord of the manour.

In ſome places in France, it is divided into three parts, one for the king, one for the proprietor of the land, and one for the finder.

Briton ſays, it is every ſubject's part, as ſoon as he hath found any *treaſure* in the earth, to make it known to the coroner of the county, *&c.*

The puniſhment for concealing *treaſure* found in England, is impriſonment and fine; but if any mine of metal be found in any ground, it always appertains to the lord of the ſoil, except it be a mine of gold or ſilver, which anciently always belonged to the king, in whoſe ground ſoever it were found: but by an act of parliament, the king now hath only the præemption.

TREASURER, an officer to whom the treaſure of a prince or corporation is committed to be kept, and duly diſpoſed of in payment of officers, and other expences. See TREASURY.

Of theſe there is a great variety.—His majeſty of Great Britain, in quality of elector of Brunſwic, is *arch-treaſurer* of the Roman empire. See ARCH-TREASURER.—In the ſtates of Poland are two *grand treaſurers*, that of the kingdom of Poland, and that of the dutchy of Lithuania.

In England the principal officers under this denomination are the *lord high treaſurer*, the *treaſurer of the houſhold*, *treaſurer of the navy*, of *the wardrobe*, of *the king's chamber*, &c. See CHAMBERLAIN, *&c.*

Anciently we had likewiſe a *treaſurer of the exchequer*, *treaſurer of war*, &c.—In the Romiſh countries the title *treaſurer* is alſo given ſomewhat abuſively to an eccleſiaſtic, who has the keeping of the relicks, and the charters and archives of a church or monaſtery. See ARCHIVES, *&c.*

This dignity ſucceeds, in ſome meaſure, to that of the ancient deacons, who had the like charge in the primitive church. See DEACON.

Lord High TREASURER *of England*, is the third great officer of the crown; under whoſe charge and government is all the king's revenue kept in the exchequer. See REVENUE, and EXCHEQUER.

He receives the office by delivery of a white ſtaff to him from the king, and holds it during the king's pleaſure: anciently he received it by delivery of the golden keys of the treaſury. He has the check of all the officers any way employed in collecting impoſts, cuſtoms, tributes, or other revenues of the crown. He has the gift of all the cuſtomers, comptrollers and ſearchers places in all the ports of London, and the nomination of the eſcheators in every county. See CUSTOM-*Houſe*, &c.

He alone, or others in commiſſion with him, letteth leaſes of all the crown lands, gives warrants to certain perſons of quality to have their wine cuſtom-free, *&c.*

The ancient ſalary was 383*l.* but of late is ſaid to have been 8000*l.* The office of lord *treaſurer* is now in commiſſion. See TREASURY.

Under TREASURER *of England.* See UNDER-*Treaſurer.*

TREASURER *of the houſhold*, is an officer who, in the abſence of the lord ſteward, has power, with the comptroller and other officers of the green cloth, and the ſteward of the Marſhalſea, to hear and determine treaſons, felonies and other crimes committed within the king's palace. See HOUSHOLD, GREEN-*Cloth*, &c.

TREASURER *of the Navy*, is an officer who receives money out of the exchequer, by warrant from the lord high *treaſurer*, or the lords commiſſioners executing that place, and pays all charges of the navy, by warrant from the principal officers of the navy. See NAVY.

TREASURY, the place wherein the revenues of a prince are received, preſerved, and diſburſed.

In England, the *treaſury* is a part of the exchequer, by ſome called the *lower exchequer.* See EXCHEQUER.

The officers of his majeſty's *treaſury*, or the lower exchequer, are the lord treaſurer, a chancellor, a ſecretary, two chamberlains, an auditor, four tellers, a clerk of the pells, uſhers of the receipt, a tally-cutter, *&c.* See each officer under his proper article, CHANCELLOR, TELLER, TALLY, *&c.*

At Rome, under the emperors, there were two kinds of *treaſuries*, the one called *ærarium*, wherein the monies deſtined to ſupport the charges of the government were kept; the other *fiſcus*, wherein were preſerved thoſe intended for the particular ſubſiſtance of the emperor and his court. In effect the ærarium belonged to the people, and the fiſcus to the prince. See ÆRARIUM, and FISCUS.

We have ſtill a reſemblance of this difference among us, but it is confounded in France, *&c.* where the king diſpoſes abſolutely of the public treaſure, *&c.*

Lords of the TREASURY.—In lieu of one ſingle director and adminiſtrator of his majeſty's revenues, under the title of lord high treaſurer; it is frequently thought proper to put that office in commiſſion, *i. e.* to appoint ſeveral perſons to diſcharge it with equal authority, under the title of lords commiſſioners of the *treaſury.* See TREASURER.

TREAT, in our old law-books, ſignifies as much as *taken out*, or *withdrawn.*—Thus a juror was challenged, becauſe he could not diſpend 40*l.* and therefore was *treat* by the ſtatute, or diſcharged. *Old. Nat. Br.* See JUROR, *&c.*

TREATISE, TRACTATUS, a ſet diſcourſe in writing on any ſubject. See TRACT.

A *treatiſe* is ſuppoſed more expreſs, formal, and methodical, than an eſſay; but leſs ſo than a ſyſtem. See ESSAY, *&c.*

TREATY, a covenant between ſeveral nations; or the ſeveral articles or conditions ſtipulated and agreed upon between ſoveraign powers. See ALLIANCE.

There are *treaties* of peace, of marriage, of confederacy, of neutrality, of capitulation, and of commerce and navigation. See PEACE, CONFEDERACY, *&c.*

The celebrated *treaties* are thoſe of Nimeguen, of Munſter, of the Pyreneans, of Weſtphalia, of Riſwick, of Utrecht, of Hanover, of Vienna, *&c.*

Treaties of commerce are uſually followed by various tarifs, to adjuſt the duties of exportation and importation of merchandizes into the reſpective dominions of the contracting powers.

The laſt *treaty* of peace, commerce, navigation, *&c.* between England and France, was ſigned at Utrecht the 1ſt of April 1713, and conſiſts of 39 articles, moſt whereof are regularly executed between the two nations, only ſome of the more particular ones cannot yet be executed, by reaſon of ſome difficulties in the tarifs. See TARIF.

Guarantee of a TREATY. See the article GUARANTEE.

TREBELLIANICA, or TREBELLIAN *Fourth*, in the Roman juriſprudence, a right belonging to an heir inſtituted by teſtament.—If the teſtator, after appointing a full and general heir, ſpent and diſpoſed of all his effects in legacies; or if he went *ultra dodrantem*, beyond three fourths thereof, in that caſe the heir was allowed to retrench and detain one fourth part of the legacies to his own uſe.—This was called the *Trebellianica*.

In like manner, if the teſtator charged his heir with a feoffment of truſt, and to reſtore the inheritance to another; in that caſe, the heir might likewiſe retain a fourth of the whole ſucceſſion, that the quality of heir might not be rendered wholly vain and fruitleſs.

TREBLE, in muſic, the higheſt or acuteſt of the four parts in ſymphony, or that which is heard the cleareſt and ſhrilleſt in a concert. See MUSIC, GRAVITY, and SYMPHONY.

In the like ſenſe we ſay, a *treble* violin, *treble* hautboy, *&c.* See VIOLIN, *&c.*

In vocal muſic, the *treble* is uſually committed to boys and girls.—Their part is the *treble*. See PART.

The *treble* is divided into firſt or higheſt *treble*, and ſecond or baſe *treble*.—The half *treble* is the ſame with the counter-tenor. See HARMONY.

TREBUCHET, TREBUCHETUM, a tumbrel, or cucking-ſtool. See CUCKING-STOOL.

TREDECILE. See the article ASPECT.

TREDDLE, or TREADLE, *Chalaza*, in natural hiſtory. See the articles CHALAZA, and EGG.

TREE, *Arbor*, the firſt and largeſt of the vegetable kind, conſiſting of a ſingle trunk, out of which ſpring forth branches and leaves. See VEGETABLE, *&c.*

Standards, or TREES *in full air*, are ſuch as naturally riſe a great height, and are not topped.—For the choice of *trees* of this kind to be tranſplanted out of a nurſery, Quintiney recommends us to ſuch as are ſtraight, ſix foot high at leaſt, and five or ſix inches thick at bottom, and three or four at top; the bark pretty ſmooth and ſhining, as a token of their youth, and of the good ſoil they grew in. See TRANSPLANTATION, NURSERY, *&c.*

Dwarf TREES, are ſuch as are kept low, and never ſuffered to have above half a foot of ſtem.—Theſe are uſed to be kept vacant or hollow in the middle, that the branches ſpreading round about the ſides may form a kind of round bowl or buſh. See DWARF.

Wall TREES, are thoſe whoſe branches are ſtretched out, and nailed againſt walls. See WALL, and ESPALIER.

For dwarf and wall *trees*, ſuch are to be choſe out of the nurſery for tranſplantation, as are ſtraight, and conſiſt of a ſingle ſtem, and a ſingle graft, rather than two or three grafts in ſeveral branches: their thickneſs at bottom ſhould be two or three inches.

Fruit TREES, are ſuch as bear *fruit*. See the article FRUIT.

Timber TREES, are thoſe whoſe trunks are tall and ſtraight, whereof beams, maſts, *&c.* are uſed to be made. See TIMBER.

Coniferous TREES, are thoſe whoſe fruit is of a conical figure, as the pine, fir, larch, *&c.*—Theſe are alſo called *reſiniferous*, by reaſon coniferous *trees* are generally covered with a bark that abounds in reſin. See RESIN.

Mr. Ray, and other authors, ſpeak of ſeveral *trees* of prodigious bulk.—The jeſuit d'Acoſta, in his hiſtory of the Indies, *lib.* 4. *c.* 3. mentions a hollow *tree* at Tlacocharaya, three leagues from Gauxa in New Spain, nine fathom within-ſide near the ground, and ſixteen without-ſide. He adds, that it is under this *tree* the barbarians aſſemble to perform their religious ceremonies, dance round their idols, *&c.*—Herrera mentions another, which ſixteen men, joining hands, cannot fathom.—F. Kircher, in his *Latium*, p. 50, affirms, he has ſeen a *tree* near Gonzano, which would lodge a whole family of 25 perſons in its cavity. The common people have a tradition, that it was planted by Auguſtus.

In the Indies there are very large foreſts conſiſting only of a ſingle *tree*, whoſe branches falling to the ground, take root, and put forth new *trees*: the fig *tree* and paretuvier are of this kind.

M. Lonvillers mentions *trees* in Peru, one part of whoſe branches produce fruit one half the year, and the other part the other half.—In China is a *tree* which bears tallow, whereof that nation make their candles. See TALLOW.

There are two or three very remarkable phænomena in the growth of *trees*, which have eſcaped the obſervation of the naturaliſts of all ages, except thoſe of our own: theſe are the perpendicularity of their trunks or ſtems, to the horizon, and the paralleliſm of their tufts to the ſpot of earth they grow on. An account of each, ſee under the articles PERPENDICULARITY, and PARALLELISM.

For the planting, tranſplanting, ſemination, pruning, felling, grafting, ſhrowding, barking, *&c.* of *trees*; ſee the reſpective articles, PLANTING, TRANSPLANTING, SEMINATION, PRUNING, ENGRAFTING, *&c.*

Mr. Ray diſtinguiſhes the *trees* and ſhrubs of our native growth in England, into, I. Such as *have their flower disjoined, and remote from the fruit*:—which are,

1°. *Nuciferous* TREES, or ſuch as bear nuts: as the walnut *tree*, the hazle-nut *tree*, the beech, the cheſnut, and the common oak. See NUT.

2°. *Coniferous* TREES, or ſuch as bear a ſquammous or ſcaly fruit, of a conical figure, and a woody or hard ſubſtance, in which are many ſeeds; which, when they are ripe, the cone opens or gapes in all its ſeveral cells or partitions, and lets them drop out: of this kind are the Scotch firs, male and female; the pine, which, in our gardens is called the Scotch fir; the common alder *tree*, and the birch *tree*.

3°. *Bacciferous* TREES, or ſuch as bear berries; as the juniper and yew *tree*. See BACCIFEROUS.

4°. *Lanigerous* TREES, or ſuch as bear a woolly, downy ſubſtance: as the black, white, and trembling poplars, willows, and oſiers of all kinds. See LANUGO, TOMENTUM, *&c.*

5°. TREES *which bear their ſeeds* (having an imperfect flower) *in leafy membranes and caſes*: as, the horn-beam, or hard-beam, called in ſome places the horn-beech.

II. Such as *have their fruits and flowers contiguous*; which are either with the flower placed on the top of the fruit, or adhering to the baſe or bottom of the fruit.

Of the former kind, ſome are *pomiferous*, as apples and pears; and ſome *bacciferous*, as the ſorb or ſervice *tree*, the white or haw-thorn, the wild roſe, ſweet-brier, currants, the great bilberry-buſh, honey-ſuckle, ivy, *&c.*

The latter kind are either ſuch as *have their fruit moiſt and ſoft when ripe*, as—1°. *Pruniferous* ones, whoſe fruit is pretty large and ſoft, with a ſtone in the middle; as the black thorn or ſloe *tree*, the black and white bullace *tree*, the common wild cherry, the black cherry, *&c.* See the article PRUNIFEROUS.

2°. *Bacciferous* TREES, as the ſtrawberry *tree* in the weſt of Ireland, miſletoe, water elder, the dwarf a large laurel, the viburnum or way-faring *tree*, the dogberry *tree*, the ſea black thorn, the berry-bearing elder, the privet, barberry, common elder, the holly, the buckthorn, the berry-bearing heath, the bramble, and the ſpindle *tree* or prickwood.

Or ſuch as *have their fruit dry when ripe*; as the bladder-nut *tree*, the box *tree*, the common elm and aſh, the maple, the gaule or ſweet willow, common heath-broom, dyers weed, furze or gorſe, the lime *tree*.

Heart of a TREE, } See { HEART,
Paralleliſm of rows of TREES, } { PARALLELISM.

Diana's TREE, *arbor Dianæ*, among the chymiſts, is a kind of metalline vegetation, which after a long proceſs ſhoots out into branches, with the appearance of leaves, and even flowers. See ARBOR.

TREE *of Mars*, *arbor Martis*, is another very ſingular vegetation, firſt diſcovered accidentally by the younger Lemery. See ARBOR.

Dormant TREE, } See { DORMANT,
Roof TREES, } { ROOF.

TREFOIL. See the article TRIFOLIUM.

TREMOR, TREMBLING, in medicine, a diſeaſe nearly akin to a convulſion, wherein there is ſomething of a convulſive motion or ſhaking, accompanying a voluntary or natural motion. See CONVULSION, and PARALYSIS.

A *tremor* is frequently found to ariſe upon the more violent paſſions, particularly anger, gluttony, venery, *&c.* but this is accidental and tranſitory.

A *tremor* is ſometimes apt to degenerate into other worſe diſeaſes, *viz.* palſey, apoplexy, lethargy, ſpaſmus, *&c.* In old men it is incurable. See TREPIDATION.

The medicine commonly made uſe of in *tremors*, and other nervous diſtempers, by the name of *palſey drops*, is no other than compound ſpirit of lavender. The moſt ſucceſsful way of uſing it, is by taking 30 or 40 drops twice or thrice a day, dropt on loaf ſugar or a little bread. It is ſuppoſed, that by this way the moſt ſpirituous and efficacious parts make their way directly by the nerves of the palate, *&c.* without undergoing the courſe of the circulation, as it is ſaid to do when taken in a liquid vehicle.

TREMOR *of the heart*. See the article PALPITATION.

TRENCH, a ditch cut, or dug in the ground, to drain off the waters in a meadow, a moraſs, or the like; or to divert the courſe of a river. See DITCH, *&c.*

Many of the bogs in Ireland have been drained, and made good ground, by only digging *trenches* around them.

TRENCHES, in fortification, are ditches which the beſiegers cut to approach more ſecurely to the place attacked; whence they are alſo called *lines of approach*.—See *Tab. Fortif. fig.* 21. *n.* 11, &c. See alſo DITCH, APPROACH, COUNTER-TRENCH, *&c.*

They ſay, *mount the trenches*, that is, go upon duty in them.—To *relieve the trenches*, is to relieve ſuch as have been upon duty there. See MOUNTING.

The enemy is ſaid to have *cleared the trenches*, when they have driven away, or killed the ſoldiers who guarded them.

Tail of the TRENCH, is the place where it was begun. See TAIL.—And the *head* that to which it was carried. See HEAD, and ATTACK.

Trenches are of ſeveral ſorts, according to the nature of the ſoil: if the adjacent territory be rocky, the *trench* is only an elevation of bavins, gabions, wool-packs, or epaulements of earth, caſt round about the place—but where the ground may be eaſily opened, the *trench* is dug therein, and bordered with a parapet on the ſide of the beſieged. See PARAPET, *&c.*

The breadth of the *trenches* is from eight to ten foot, and the depth from ſix to ſeven; they are cut in talus, or aſlope. See TALUS.

The *trenches* are to be carried on with winding-lines, in ſome manner parallel to the works of the fortreſs, ſo as not to be in view of the enemy, nor to expoſe their length to the enemy's ſhot: for then they will be in danger of being enfiladed, or ſcoured by the enemy's cannon: this carrying of the *trenches* obliquely, they call carrying them by *coudees*, or returns. See ENFILADE.

Opening the **TRENCHES**, is when the beſiegers begin to work upon the line of approaches; which is uſually done in the night; ſometimes within muſket-ſhot, and ſometimes within half, or whole cannon-ſhot of the place, if there be no riſing ground about it, the gariſon ſtrong, and their cannon well ſerved. See OPENING.

The workmen that open the *trenches* are always ſupported by bodies of men againſt the ſallies of the beſieged; and ſometimes thoſe bodies lie between them and the place, as alſo on their right and left.

The pioneers ſometimes work on their knees; and the men that are to ſupport them lie flat on their faces, in order to avoid the enemy's ſhot; and the pioneers are likewiſe uſually covered with mantelets, or ſauciſſons.

To **TRENCH** *the ballaſt*, is a ſea phraſe, ſignifying to divide the ballaſt into ſeveral *trenches* in a ſhip's hold. See BALLAST.

TRENCHE', in heraldry. See the article TRANCHE'.

TRENCHING-*Plough*, is an inſtrument for cutting out the ſides of *trenches* and drains, or the ſides of turf, *&c.* See PLOUGH.

TRENTAL, TRIGINTAL, or TRICENNAL, a Romiſh office for the dead, conſiſting of thirty maſſes, rehearſed for thirty days ſucceſſively after the party's death.

The *trental* is thus called from the Italian, *trenta*, *triginta*, *thirty*.—It is mentioned *anno primo Ed.* VI. *Et volo, & ordino, quod executores mei ordinant ſeu ordinare faciunt unum* trental *pro ſalute animæ meæ.*

TREPANUM, TREPAN, a chirurgeon's inſtrument, ſerving to perforate a bone, eſpecially that of the cranium, and uſed as ſuch in the operation of *trepanning*. See TREPANNING.

It is alſo called *abaptiſton*, *anabaptiſton*, *modiolus*, *terebra*, *terebellum*.—*Abaptiſton*, from α privative, and βαπτίζω, *to dip*; as having a broad circle over its point, to prevent it, in the operation of trepanning, from penetrating through the membranes that inveſt the brain.—*Modiolus*, from *modus*, *a meaſure*; being contrived to enter only to a certain depth.—*Terebra*, &c. from τερέω, *to bore*.

It is in form of a terebellum, or ſmall wimble, only the handle indented, ſomewhat in manner of a round ſaw.

It ſerves for the cure of wounds, contuſions and fractures of the cranium, when they do not go beyond the ſecond table; for by means hereof, an amputation or exfoliation is made of what part, or quantity of a bone one pleaſes. See CRANIUM, FRACTURE, *&c.*

It has uſually a ſharp nail in the middle of its circumference, ſerving to keep it firm and ſteady during the operation.—It ſhould alſo have a kind of cope to riſe and fall as occaſion requires, that it may not go deeper in the bone than is neceſſary.

There are alſo two-pointed *trepans*, others triangular, quadrangular, and hexagonal for the cure of a caries of the bones.—There are alſo perforative *trepans*, and exfoliative ones. See EXFOLIATION.

TREPANNING, in chirurgery, the operation of relieving cuts, contuſions, caries's, and fractures in the ſcull, by means of an inſtrument called the *trepanum*. See TREPANUM.

Trepanning is a very dangerous and difficult operation; not to be uſed, unleſs when the chips and prominences of the bones prick; when the upper table is entire, but depreſſed, and the lower broken; and when the extravaſated blood would endanger the perſon's being ſuffocated. See CRANIUM.

The manner of *trepanning* or opening the ſcull, is thus: the hairs being ſhaven off, the ſkin is to be cut through to the pericranium, avoiding as much as poſſible, the muſcles of the temples, and the ſutures of the ſcull: and for this time the wound is to be bound up, unleſs there be ſo little blood ſpilt, that the pericranium may at the ſame time be pulled up from the bone.

After a few hours, ſtop the patient's ears, and take one of the inſtruments called a *male trepanum*, or *modiolus*; fix its point in the ſcull, but ſo far off the fracture, that it touch it not, much leſs the ſuture, with its teeth; though ſome ſurgeons do not mind to avoid the ſutures, but aſſure us, they have perforated them as ſucceſsfully as any other part.

Then, holding the inſtrument faſt with the left hand, turn it round with the right, till you have cut a pretty deep hole: after this take a *female trepanum*, which has no point in the middle, and turn it round as before: in the mean time, take away the duſt or chips that proceed from the perforation, and moiſten the inſtrument in oil and water, to make it cool and ſlippery.

The blood appearing, will ſhew you are now gone as deep as the ſecond table, *i. e.* beyond the ſcull, to the dura mater; in which caſe you muſt preſs very gently, leſt that membrane be unadviſedly hurt.

When the bone begins to wag, put ſomething in between the ſides of the wound; looſen it, and take it out with a pair of ſurgeon's pincers, or forceps.

After the operation is over, the part is to be waſhed gently with weak red wine, and proper dreſſings applied thereon, as honey of roſes, arceus liniment, oil of St. John's wort, *&c.*—If the dura mater be corrupted, add, as occaſion requires, ſpirit of wine, tincture of myrrh and aloes, Venice turpentine, honey Ægyptiacum, *&c.*

Mr. Cheſelden takes notice, that the ſinus's and ſpine of the os frontis, make it very dangerous, if not impracticable, to apply a *trepanum* to the middle and lower part of the forehead.

TREPIDATION, in medicine, a tremor, or trembling of the nerves and members of the body. See TREMOR.

The firſt ſymptom of madneſs in dogs, is a *trepidation* of the members, *&c.* See HYDROPHOBIA.

TREPIDATION, in the ancient aſtronomy, denotes a libration of the eighth ſphere; or a motion which the Ptolemaic ſyſtem attributes to the firmament, to account for certain almoſt inſenſible changes and motions obſerved in the axis of the world; by means whereof the latitudes of the fixed ſtars come to be gradually changed, and the ecliptic ſeems to approach reciprocally, firſt towards one pole, then the other. See PTOLEMAIC, *&c.*

This motion is alſo called the motion of the firſt libration. See LIBRATION, and TITUBATION.

TRESPASS, in law, ſignifies any tranſgreſſion of the law, under treaſon, felony, or miſpriſion of treaſon. See TRANSGRESSION.

For a lord of parliament to depart from thence without the king's licence, is neither treaſon, nor felony, but *treſpaſs*. *Staundford Pl. Cor.*

TRESPASS, however, is moſt commonly uſed either for that wrong or damage which is done to the king in his foreſt, or by one private man to another.

In this ſenſe it is of two ſorts: *treſpaſs general*, otherwiſe called *treſpaſs vi & armis*, where force or violence is uſed—and *treſpaſs ſpecial*, otherwiſe called *treſpaſs upon the caſe*; which ſhould be that done without force. See ACTION *on the caſe*.—But the two ſpecies are ſometimes confounded.

In an action of *treſpaſs*, the plaintiff always ſues for damages, or the value of the hurt done him by the defendant. See DAMAGES.

Treſpaſs is alſo divided into *local* and *tranſitory*.

TRESPASS *local*, is that which is ſo annexed to the place certain, that if the defendant join iſſue upon a place, and traverſe the place mentioned in the declaration, and aver it; it is enough to defeat the action. See LOCAL.

TRESPASS *tranſitory*, is that which cannot be defeated by the defendant's traverſe of the place, becauſe the place is not material.

The action of *treſpaſs*, *quare clauſum fregit*, ought to be local.

TRESSURE, in heraldry, a diminutive of an orle, uſually ſuppoſed to be half the breadth thereof. See ORLE.

It is uſually borne flory, and counter-flory; and ſometimes double, as in *Tab. Herald. fig.* 85. and ſometimes triple.

TRESTLE, TRESSEL, or TRUSSEL, is explained by Minſhieu to be a three-footed ſtool; more particularly a wooden frame or ſtand to bear up tables, ſcaffolds, or the like.

TRET, in commerce, an allowance made for the waſte, or the duſt that may be mixed with any commodity; which is always 4 pounds in every 104 pounds weight. See TARE.

TREUGA *Dei*, TREVE *de Dieu*. See TRUCE *of God*.

TRIA *prima*, among the chymiſts, the three hypoſtatical principles, *viz.* ſalt, ſulphur, and mercury; of which they hold all bodies to be primarily made, and into which they are all held reſolvable by fire. See PRINCIPLE, and ELEMENT. See alſo SALT, SULPHUR, and MERCURY.

TRIAD, TRIAS, ΤΡΙΑΣ, a term ſometimes uſed for a trinity. See TRIAS, and TRINITY.

TRIAL, in law, the examination of any cauſe, whether civil or criminal, according to the laws of the realm, before a proper judge. See PROOF, *&c.*

Of this there are divers kinds: matters of fact, *e. gr.* being to be *tried* by the jurors; matters of law by the juſtice; matters of record by the record itſelf. See JURY, JUDGE, JUSTICE, RECORD, *&c.*

A lord of parliament, indicted of treaſon or felony, ſhall be *tried*, without any oath, by his peers, upon their honours and allegiance; but in appeal, at the ſuit of any ſubject, they ſhall be *tried* per bonos & legales homines. See PEER, and APPEAL.

If ancient demeſne be pleaded of a manour, and denied, this ſhall be *tried* by the record of domeſday. See ANCIENT *Demeſne*, and DOMESDAY.

Baſtardy, excommunication, lawfulneſs of marriage, and other eccleſiaſtical matters, ſhall be *tried* by the biſhop's certificate. See BASTARD, *&c.*

Before *trial* in a criminal caſe, it is uſual to aſk the criminal how he will be *tried*; which was anciently a very pertinent queſtion, though not ſo now; in regard there were formerly ſeveral ways of *trial*, viz. by *battle*, *ordeals*, and *jury*. See ORDEAL, and JURY.

When the criminal anſwered, by God and his country, it ſhewed he made choice to be tried by a jury.—But there is now no other way of *trial*.—This is alſo called *trying per pais*, *per patriam*.

For the ancient manner of *trial* by combat, and great aſſize, ſee COMBAT, DUEL, ASSISE, CHAMPION, &c.

TRIANGLE, in geometry, a figure comprehended under three lines, or ſides, and which of conſequence has three angles. See FIGURE, and ANGLE.

If the three lines or ſides of the *triangle* be all right, it is ſaid to be a *plain* or *rectilinear triangle*. See PLAIN, and RECTILINEAR.

If all the three ſides of the *triangle* be equal (as ABC, *Tab. Geometry*, *fig.* 68.) it is ſaid to be *equilateral*. See EQUILATERAL.

If only two of the ſides of the *triangle* be equal (as in DEF, *fig.* 69.) it is called an *iſoſceles*, or *equicrural triangle*. See ISOSCELES, &c.

If all the ſides of the *triangle* be unequal to each other (as in ACB, *fig.* 70.) the *triangle* is ſaid to be *ſcalenous*. See SCALENUS.

If one of the angles, as K, (*fig.* 71.) of a *triangle* KML, be a right angle, the *triangle* is ſaid to be *rectangular*. See RECTANGLE.

If one of the angles, as N, (*fig.* 72.) be obtuſe, the *triangle* is ſaid to be *obtuſangular*, or *amblygonous*. See AMBLYGON.

If all the angles be acute, as in ACB, (*fig.* 68.) the *triangle* is ſaid to be *acutangular*, or *oxygonous*. See ACUTANGLE, &c.

If the three lines of the *triangle* be all curves, the *triangle* is ſaid to be *curvilinear*. See CURVILINEAR.

If ſome of the ſides be right, and others curve, the angle is ſaid to be *mixtilinear*.

If the ſides be all arches of great circles of the ſphere, the *triangle* is ſaid to be *ſpherical*. See SPHERICAL *Triangle*.

Similar TRIANGLES, } See the articles { SIMILAR,
Baſe of a TRIANGLE, } { BASE,
Canon of TRIANGLE, } { CANON,
Legs of a TRIANGLE, } { LEGS.

Conſtruction of TRIANGLES.—1. Two ſides, as AB and AC, *fig.* 73. being given in numbers, or otherwiſe, together with the quantity of the angle intercepted between them, A; to conſtruct a *triangle*—aſſume AB as a baſe, and in A make the given angle; on the other leg ſet off the other given line AC; laſtly, draw BC: then will ABC be the *triangle* required.

Hence, two ſides with the intercepted angle being determined, the whole *triangle* is determined.—Wherefore, if in two *triangles* ACB and acb; $a=A$; and $ab : ac :: AB : AC$, the *triangles* are determined in the ſame manner, and are therefore ſimilar; conſequently $c=C$, and $b=B$, $ab : bc :: AB : BC$, &c.

2. Three ſides, AB, BC, and CA, *fig.* 68. being given, any two whereof, as AC, AB, taken together, are greater than the third, to conſtruct a *triangle*.—Aſſume AB for a baſe; and from A, with the interval AC, deſcribe an arch y; and from B, with the interval BC, deſcribe another arch x; draw the right lines AC and BC. Thus is the *triangle* conſtructed.

Hence, as of any three given right lines, only one *triangle* can be conſtructed; by determining the three ſides, the whole *triangle* is determined.

Wherefore, if in two *triangles* ACB and acb (*fig.* 73.) $AC : AB :: ac : ab$; $AC : CB :: ac : bc$; the *triangles* are determined in the ſame manner, and conſequently are ſimilar, and therefore mutually equiangular.

3. A right line, as AB, and two adjacent angles A and B, which, taken together, are leſs than two right ones, being given, to deſcribe the *triangle* ABC.—On the given line AB, make the two given angles A and B; continue the ſides AC and BC till they meet in C: then will ABC be the *triangle* required.

Hence, one ſide and two angles being given, the whole *triangle* is determined.—Wherefore, if in two *triangles* $A=a$ and $B=b$, the *triangles* are determined after the ſame manner, and therefore are ſimilar.

Menſuration of TRIANGLES.—To find the area of a *triangle*, multiply the baſe AB (*fig.* 74.) by the altitude Cd; half the product is the area of the *triangle* ABC.

Or thus: multiply half the baſe AB by the altitude Cd; or the whole baſe by half the altitude; the product is the area of the *triangle*.

E. gr.

AB=342	AB=342	½ AB=171
Cd=234	½ Cd=117	Cd=234
1368	2394	684
1026	342	513
684	342	342
2) 80028 (	40014	40014 area
area 40014		

Or, the area of any *triangle* is had by adding all the three ſides together, and taking half the ſum; and from that half ſum ſubtracting each ſide ſeverally, and multiplying that half ſum and the remainder continually into one another, and extracting the ſquare root of the product.

Hence, 1. if between the baſe, and half the altitude; or between the altitude and half the baſe, be found a mean proportional, it will be the ſide of a ſquare equal to the *triangle*.

2. If the area of a *triangle* be divided by half the baſe, the quotient is the altitude.

Properties of plain TRIANGLES.—1. If in two *triangles* ABC and abc (*fig.* 73.) the angle A be $=a$, and the ſides $AB=ab$, and $AC=ac$; then will the ſide $BC=bc$, and the angles $C=c$, and $B=b$; and therefore the whole *triangles* will be equal and ſimilar.

2. If one ſide of a *triangle* ABC (*fig.* 75.) be continued to D, the external angle DAB will be greater than either of the internal oppoſite ones B or C.

3. In every *triangle*, the greateſt ſide is oppoſed to the greateſt angle, and the leaſt to the leaſt.

4. In every *triangle*, any two ſides taken together are greater than the third.

5. If in two *triangles*, the ſeveral ſides of the one be reſpectively equal to the ſides of the other, the angles will likewiſe be reſpectively equal; and conſequently the whole *triangles* equal and ſimilar.

6. If any ſide, as BC (*fig.* 76.) of a *triangle* ACB be continued to D, the external angle DOA will be equal to the two internal oppoſite ones y and z taken together.

7. In every *triangle*, as ABC, the three angles A, B, C, taken together, are equal to two right ones, or 180°.

Hence, 1. If the *triangle* be rectangular, as MKL (*fig.* 71.) the two oblique angles M and L, taken together, make a right angle, or 90°; and therefore are half right, if the *triangle* be iſoſceles.—2. If one angle of a *triangle* be oblique, the other two taken together are oblique likewiſe.—3. In an equilateral *triangle*, each angle is 60°.—4. If one angle of a *triangle* be ſubtracted from 180°, the remainder is the ſum of the other two; and if the ſum of two be ſubtracted from 180°, the remainder is the third.—5. If two angles of one *triangle* be equal to two of another, either together or ſeparately, the third of the one is likewiſe equal to the third of the other.—6. Since in an iſoſceles *triangle* DFE (*fig.* 69.) the angles at the baſe y and v are equal; if the angle at the vertex be ſubtracted from 180°, and the remainder be divided by 2, the quotient is the quantity of each of the equal angles: in like manner, if the double of one of the angles at the baſe y be ſubtracted from 180°, the remainder is the quantity of the angle at the vertex.

8. If in two *triangles* ABC and abc (*fig.* 73) $AB=ab$, $A=a$, and $B=b$; then will $AC=ac$, $BC=bc$, $C=c$, and the *triangle* ACB equal and ſimilar to the *triangle* abc.—Hence, if in two *triangles* ACB and acb, $A=a$, $B=b$, and $BC=bc$; then will $C=c$; conſequently $AC=ac$, $AB=ab$; and the *triangle* $ACB=acb$.

9. If in a *triangle* DFE the angles at the baſe y and v, (*fig.* 69.) be equal, the *triangle* is iſoſceles; conſequently, if the three angles be equal, it is equilateral.

10. If in a *triangle* ABC (*fig.* 77.) a right line DE be drawn parallel to the baſe, then will $BA : BC :: BD : BE :: AD : EC$; and $BA : AC :: BD : DE$; conſequently the *triangle* BDE ſimilar to BAC.

11. Every *triangle* is inſcribable in a circle. See CIRCLE.

12. The ſide of an equilateral *triangle*, inſcribed in a circle, is in power triple of the radius. See RADIUS.

13. *Triangles* on the ſame baſe, and having the ſame height, that is, being between the ſame parallel lines, are equal. See PARALLEL.

14. Every *triangle*, as CFD, (*fig.* 41.) is one half of a parallelogram ACDB on the ſame, or an equal baſe CD, and of the ſame altitude, or between the ſame parallels: or a *triangle* is equal to a parallelogram upon the ſame baſe, but half the altitude; or half the baſe, and the ſame altitude. See PARALLELOGRAM.

15. In every *triangle*, as well plain as ſpherical, the ſines of the ſides are proportional to the ſines of the oppoſite angles.

16. In every plain *triangle*, as the ſum of two ſides is to their difference, ſo is the tangent of half the ſum of the oppoſite angles, to the tangent of half their difference. See TANGENT.

17. If a perpendicular be let fall upon the baſe of an oblique angled *triangle*, the difference of the ſquares of the ſides is equal to double the rectangle under the baſe, and the diſtance of the perpendicular from the middle of the baſe.

18. The ſides of a *triangle* are cut proportionably, by a line drawn parallel to the baſe.

19. A whole *triangle*, is to a *triangle* cut off by a right line, as the rectangle under the cut ſides, is to the rectangle of the other two ſides.

20. In a right lined *triangle*, a line drawn from the right angle at the top perpendicular to the hypothenuſe, divides the *triangle* into two other right lined *triangles*, which are ſimilar to the firſt *triangle*, and to one another.

21. In every right-angled *triangle*, the ſquare of the hypothenuſe is equal to the ſum of the ſquares of the other two ſides. See HYPOTHENUSE.

22. If any angle of a *triangle* be biſſected, the biſſecting line will divide the oppoſite ſide, in the ſame proportion as the legs of the angle are to one another. See BISSECTION.

23. If the vertical angle of any *triangle* be biſſected, the difference of the rectangles, made by the ſides and the ſegments of the baſe, is equal to the ſquare of the line that biſſects the angle.

24. If a right line BE (*fig.* 78.) biſſect an angle ABC of a *triangle*, the ſquare of the ſaid line BE=AB+BC—AE+EC. Newt. *Arith. Univerſ.*

To divide a *triangle* into any given number of equal parts,—divide the baſe CD (*fig.* 77. *n.* 2.) into as many equal parts as the figure is to be divided into; and draw the lines A1, A2, &c.

Reſiſtance of a TRIANGLE, } See { RESISTANCE.
Characteriſtic TRIANGLE, } See { CHARACTERISTIC.

Properties of ſpherical TRIANGLES. See SPHERICAL *Triangle.*

TRIANGLE, in trigonometry.—The ſolution or analyſis of *triangles* is the buſineſs of trigonometry. See TRIGONOMETRY. The ſeveral caſes thereof are reducible to the following problems.

Solution of plane TRIANGLES.—1. Two angles A and C (*Tab. Trigonom. fig.* 27.) being given, together with the ſide AB oppoſite to one of them, C; to find the ſide BC oppoſite to the other, A.—The rule or canon is this: as the ſine of the angle C, is to the given ſide AB, oppoſite to the ſame; ſo is the ſine of the other angle A, to the ſide required. The ſide BC, therefore, is commodiouſly found by the logarithms, from the rule for finding a fourth proportional to 3 numbers given. See LOGARITHM.

For an example: ſuppoſe C=48° 35′, A=57° 28′, AB=74′. The operation will ſtand thus:

Log. of ſine of C 9.8750142
Log. of AB 1.8692317
Log. of ſine of A 9.9258681

Sum of log. of AB and of ſine of A } 11.7950998
Log. of BC 1.9200856. The number correſponding to which, in the table of logarithms, is 83, the quantity of the ſide ſought.

2. Two ſides AB and BC, together with the angle C, oppoſite to one of them given; to find the other angles A and B.—The rule is this: as one ſide AB is to the ſine of the given angle oppoſite thereto C; ſo is the other ſide BC, to the ſine of the angle required oppoſite thereto.

E. gr. ſuppoſe AB=94′, BC=69′, C=72° 15′.

Log. of AB 1.9731279
Log. of ſine of C 9.9788175
Log. of BC 1.8388491

Sum of log. of ſine of C and of BC } 11.8176666
Log. of ſine of A 9.9444387. The number correſponding to which in the table of logarithms, is 61° 37′. Now, the given angle C being 72° 15′, the ſum of the two 133° 52′ ſubtracted from 180, the ſum of the three, gives 46° 8′ for the other angle ſought B.

In like manner, ſuppoſe, in a right angled *triangle* (*fig.* 28.) that beſide the right angle A, is given the hypothenuſe BC, 49, and the cathetus AC, 36, to find the angle B; then will the operation ſtand thus:

Log. of BC 1.6901961
Log. of whole ſine 10.0000000
Log. of AC 1.5563025

Log. of ſine of B 9.8661064. The correſponding number to which, in the table of logarithms, is 47° 16′; conſequently C=42° 44′.

3. Two ſides BA and AC, together with the included angle A being given; to find the two remaining angles.—I. If the *triangle* ABC be rectangular; take one of the ſides including the right angle, as AB, for radius; then will CA be the tangent of the oppoſite angle B: the rule then is—As one leg AB is to the other AC; ſo is the whole ſine to the tangent of the angle B.

E. gr. ſuppoſe BA 79, and AC 54:

Log. of BA 18976271
Log. of AC 17323938
Log. of whole ſine 100000000

Log. of tang. of B 9.8347667; the correſponding number to which, in the table of logarithms, is 34° 21′; conſequently the angle C is 55° 39′.

II. If the angle A be oblique (*fig.* 27.) the rule is; as the ſum of the given ſides AB and AC (*fig.* 29.) is to their difference; ſo is the tangent of half the ſum of the ſought angles C and B, to the tangent of half the difference. Adding, therefore, the half difference to the half ſum; the aggregate will be the greater angle C; and ſubtracting the half difference from the half ſum; the remainder is the leſs angle B.

E. gr. ſuppoſe AB=75′, AC 58′, A 108° 24′; then will

AB 75 AB 75 A+B+C 179° 60′
AC 58 AC 58 A 108 24

Sum 133 dif. 17 B+C 71 36

½ (B+C) 35 48

Log. of AB+AC 2.1238516
Log. of AB—AC 1.2304489
Log. of tang. ½ (B+C) 9.8580694

Sum of logg. 12.0885183
Log. of tang. ½ (C—B) 8.9646667. The correſponding number to which is 5° 16′.

½ (B+C)=35° 48′ ½ (B+C)=35° 48′
½ (C—B)= 5° 16′ ½ (C—B)= 5° 16′

C=41 4 B=30 32

4. The three ſides, AB, BC and CA (*fig.* 30.) being given, to find the angle A, B and C.—From the vertex of the angle A, with the extent of the leaſt ſide AB, deſcribe a circle: then will CD be = the ſum of the legs AC and AB; and CF their difference.—The rule then is,

As the baſe BC is to the ſum of the legs CD; ſo is the difference of the legs CF, to the ſegment of the baſe CG.—This ſegment, thus found, being ſubtracted from the baſe CB, the remainder is the chord GB. Then, from A to the chord GB let fall the perpendicular AE; thus will BE=EG=½ GB.

Thus in a rectangled *triangle*, AEB, the ſides AB and BE being given; or, in an obliquangled *triangle*, ACE, the ſides AC and CE being given: the angles B and A are found.

E. gr. ſuppoſe AB=36, AC=45, BC=40.

AC=45 AC=45
AB=36 AB=36

AC+AB=81 FC= 9
Log. of BC= 1.6020600
Log. of AC+AB 1.9084850
Log. of FC= 0.9542425

Sum of logg.= 2.8627275

Log. of CG= 1.2606675. The correſponding number to which in the tables is 18.

BC=4000 EG=1089
CG=1822 CG=1822

BG=2178 CE=2911

BE=1089
Log. of AB= 3.5563025
Log. of whole ſine=10.0000000
Log. of EB= 3.0370279

Log. of ſine of EAB=9.4807254. The correſponding number to which in the tables is 17° 36′; conſequently the angle ABE 7° 14′.

Log. of AC= 3.6532125
Log. of whole ſine=10.0000000
Log. of CE= 3.4640422

Log. of ſine of EAC=9.8108297: to which the correſpondent number in the tables is 40° 18′; therefore ACE 49° 42′; and CAB 57° 54′.

Solution of right-angled ſpherical TRIANGLES, *by the common rules.*—In a right-angled ſpherical *triangle*, any two parts beſide the right-angle being given, to find any of the reſt.

1. Conſider whether the parts which come to the queſtion, be conjunct or disjunct; (ſee PART.) If the disjunct be oppoſite to each other; as, if the hypothenuſe BC, and the angle C (*fig.* 31.) be given, to find the oppoſite leg AB; then the rule is:—As the whole ſine is to the ſine of the hypothenuſe BC; ſo is the ſine of the angle C, to the ſine of the oppoſite leg AB. 2. If the disjunct parts be not oppoſite to each other; as, if AB, and the adjacent angle B be given for the oppoſite angle C; the ſides of the *triangle* are to be continued one way, till they become quadrants, that you may thus have a new *triangle*, wherein the parts that come into the queſtion are mutually oppoſite to each other; as, in our caſe, the *triangle* EBF, wherein we have given BF, the complement of the leg AB, and the angle B for EF, the complement of the angle C. The rule then is:—As the whole ſine is to the ſine of BF; ſo is the ſine of the angle B to the ſine EF, or co-ſine of C.

3. If the hypothenuſe be not among the conjunct parts, as if the legs AB and AC be given for an angle oppoſite to one of them; the rule is:—As the ſine of AC is to the whole ſine; ſo is the tangent of AB, to the tangent of C.

4. But if the hypothenuſe be found among the conjunct parts, as if the hypothenuſe BC and the angle C be given to find the adjacent ſide AC; the ſides of the *triangle* are to be continued one way till they become quadrants, that we may have a new *triangle*,

triangle, wherein the hypothenuſe is not among the parts that come into the queſtion; *e. g.* in our caſe, the *triangle* EBF, wherein are given the complement EB of the hypothenuſe BC, and the complement of the angle C, and the angle F the complement of the leg AC. Since then, in the *triangle* EFB, the hypothenuſe does not come in the queſtion, the rule is as before:

As the ſine of EF, or co-ſine of C, is to the whole ſine; ſo is the tangent of EB, or co-tangent of BC, to the tangent of F, or co-tangent of AC.

5. When the ſides of a *triangle* are to be continued, it is the ſame thing which way ſoever they be produced, provided no acute angle come into the queſtion, otherwiſe the ſides are to be continued through the other oblique one. If both be in the connection, the ſides are to be continued through that adjacent to the ſide in queſtion.

By this means a *triangle* is always obtained wherein the thing required is found, either by the rule of ſines or tangents.

Solution of right-angled ſpherical TRIANGLES, *by one catholic rule.*—Conſider, as before, whether the parts that come in queſtion be conjunct or disjunct. See PART.

If either one, or both the ſides, including the right-angle, come into the queſtion; for it, among the data, write its complement to a quadrant.—Since then by the catholic rule, delivered under the article trigonometry, the whole ſine, with the ſine complement of the middle part, is equal to the ſines of the disjunct parts, and the co-tangents of the conjunct parts; from the ſum of thoſe data ſubtract the third datum; the remainder will be ſome ſine or tangent, the ſide or angle correſponding to which, in the artificial canon of *triangles* is the ſide or angle ſought.

This univerſal rule being of great ſervice in trigonometry, we ſhall apply it to the various caſes thereof, and illuſtrate it with examples; which examples, in the caſe of disjunct or ſeparate parts will at the ſame time illuſtrate the common method, but in the caſe of contiguous parts admits of other ſolutions.

1. Given the hypothenuſe BC 60° and the angle C 23° 30′, to find the oppoſite leg AB (*fig.* 22.)—Since AB is the middle part, C and BC are disjunct, (ſee PART;) the whole ſine, with the co-ſine of the complement AB, *i. e.* with the ſine itſelf of AB, is equal to the ſines of C and BC.

Therefore from ſine of C   96006997
Sine of BC   99375306

Sum   195382303
Subtract whole ſine   100000000
Remain ſine of AB   9.5382303. The correſponding number to which, in the canon, 20° 12′ 6″.

2. Given the hypothenuſe BC 60°, and the leg AB 20° 12′ 6″, to find the oppoſite angle C.—It is evident from the preceding problem, that from the ſum of the whole ſine, and the ſine of the leg AB, the ſine of the hypothenuſe BC is to be ſubtracted, the remainder is the ſine of the angle C. The example therefore of the former caſe is eaſily converted into an example of this.

3. Given the leg AB 20° 12′ 6″, and the oppoſite angle C 23° 30′, to find the hypothenuſe BC.—It is evident from the firſt caſe, that from the ſum of the whole ſine, and the ſine of AB is to be ſubtracted the ſine of the angle C, and the remainder is the ſine of the hypothenuſe BC.

4. Given the hypothenuſe BC 60°, and one leg AB 20° 12′ 16″, to find the other leg.—Since BC is a mean part, and AB and AC are disjunct parts, the whole ſine, with the co-ſine of the hypothenuſe BC, are equal to the ſines of the complements; *i. e.* to the co-ſines of the legs AB and AC.

Therefore from the whole ſine   100000000
Co-ſine of BC   96989700

Sum   196989700
Subtract co-ſine of AB   99724279

Remains co-ſine of AC   97265421. The correſponding number to which, in the canon, is 32° 11′ 34″; therefore AC 57° 48′ 26″.

5. Given the legs AC 57° 48′ 26″, and AB 20° 12′ 6″, to find the hypothenuſe BC.—It is evident from the preceding caſe, that the whole ſine is to be ſubtracted from the ſum of the co-ſines of the legs AB and AC; the remainder is the co-ſine of the hypothenuſe BC. The example, therefore, of the preceding caſe is eaſily applied to this.

6. Given the leg AC 57° 48′ 26″, and the adjacent angle C 23° 30′, to find the oppoſite angle B.—Since B is a middle part, and A and C disjunct parts; the whole ſine, with the co-ſine of B, is equal to the ſine of C, and the ſine of the complement; *i. e.* to the co-ſine of AC.

Therefore from the ſine of C   96006997
Co-ſine AC   97265421

Sum   193272418
Subtract whole ſine   100000000

Remains co-ſine of B   93272418. The number correſponding to which, in the canon, is 12° 15′ 56″; therefore B 77° 44′ 4″.

7. Given the leg AC 57° 48′ 26″, and the oppoſite angle B 77° 44′ 4″, to find the adjacent angle C.—It is evident from the preceding caſe, that the co-ſine of AC is to be ſubtracted from the ſum of the whole ſine, and the co-ſine of B; the remainder is the ſine of C. The former example, therefore, is eaſily accommodated to the preſent caſe.

8. Given the oblique angle B 77° 44′ 4″, and C 23° 30′, to find the leg adjacent to the other AC.—From problem the ſixth it is evident, that the ſine of C is to be ſubtracted from the ſum of the whole ſine, and the co-ſine of B; and that the remainder is the co-ſine of AC. The example of the ſixth problem is eaſily applied to this.

9. Given the leg AC 57° 48′ 26″, and the adjacent angle C 23° 30′, to find the oppoſite leg AB.—Since AC is a mean part, and C and AB conjunct parts; the whole ſine, with the ſine of AC, is equal to the co-tangent of C, and the tangent of AB.

Therefore from the whole ſine   100000000
Sine of AC   99275039

Sum   199275039
Subtract co-tangent of C   103616981
Remains tangent of AB   95658058. To which the correſponding number in the canon is 20° 12′ 6″.

10. Given the leg AB 20° 12′ 6″, and the oppoſite angle C 23° 30′, to find the adjacent leg AC.—From the ſum of the co-tangent of C, and the tangent of AB, ſubtract the whole ſine; the remainder is the ſine of AC.

11. Given the legs AB 20° 12′ 6″, and AC 57° 48′ 26″, to find the angle C, oppoſite to one of them.—From the ſum of the whole ſine, and ſine of AC, ſubtract the tangent of BA; the remainder is the co-tangent of C.

12. Given the hypothenuſe BC 60°, and the oblique angle C 23° 30′, to find the adjacent leg AC.—Since C is a middle part, and BC and AC conjoint parts; the whole ſine, with the co-ſine of C, will be equal to the co-tangent of AC.

Therefore from whole ſine   100000000
Co-ſine of C   99623978

Sum   199623978
Subtract co-tangent of BC   97614394
Remains tangent of AC   102009584. The number correſponding to which, in the tables, is 57° 48′ 26″.

13. Given the leg AC 57° 48′ 26″, and the adjacent angle C 23° 30′, to find the hypothenuſe BC.

From the ſum of the whole ſine, and the co-ſine of C, ſubtract the tangent of AC; the remainder is the co-tangent of BC.

14. Given the hypothenuſe BC 60°, and the leg AC 57° 48′ 26″, to find the adjacent angle C.

From the ſum of the co-tangent of BC, and tangent of AC, ſubtract the whole ſine; the remainder is the co-ſine of C.

15. Given the hypothenuſe BC 60°, and one angle C 23° 30′, to find the other B.

Since BC is the middle part, and B and C disjunct parts, the whole ſine, with the co-ſine of BC will be equal to the co-tangents of B and C.

Therefore from whole ſine   100000000
Co-ſine of BC   96989700

Sum   196989700
Subtract co-tangent of C   103616981
Remains co-tangent of B   93372719. The correſponding number to which, in the canon, is 12° 15′ 56″; therefore B is 77° 44′ 4″.

16. Given the oblique angles B 77° 44′ 4″, and C 23° 30′, to find the hypothenuſe BC.—From the ſum of the co-tangents of C and B, ſubtract the whole ſine; the remainder is the co-ſine of BC.

Solution of oblique-angled ſpherical TRIANGLES.—1. In an oblique-angled ſpherical *triangle* ABC (*Tab. Trigonometry, fig.* 32.) two ſides AB and BC being given, together with an angle A, oppoſite to one of them, to find the other C: the rule is;

As ſine of the ſide BC, is to the ſine of the oppoſite angle A; ſo is the ſine of the ſide BA, to the ſine of the oppoſite angle C.

Suppoſe, for example, BC 39° 29′, A 43° 20′, BA 66° 45′; then will

Sine of BC   98033572
Sine of A   98364771
Sine of BA   99632168

197996939
Sine of C   99963367. The correſponding number to which, in the tables, is 82° 34′ 7″.

2. Given two angles C 82° 34′ 7″, and A 43° 20′, together with the ſide AB 60° 45′, oppoſite to one of them C; to find the ſide BC oppoſite to the other of them A; ſay, as ſine of angle C is to ſine of the oppoſite ſide AB;

ſo is ſine of angle A to ſine of oppoſite ſide BC.—The former example may ſuffice for the preſent caſe.

3. Given two ſides AB 66° 45′, and BC 39° 29′, together with an angle oppoſite to one of them A 45° 20′; to find the angle included by them B.—Suppoſe the angle C to be acute, ſince the other, A, is alſo acute, the perpendicular BE falls in with the *triangle*. In the rectangled *triangle* ABE, therefore, from the given angle A, and ſide AB, find the angle ABE. Since BE is aſſumed as a lateral part in the *triangle* AEB, the angle EBC is a middle part, and the ſide BC a conjoint part: the co-ſine of the angle EBC will be found by ſubtracting the co-tangent of AB from the ſum of the co-ſine of the angle ABE, and the co-tangent of BC. If then the angles ABE and EBC be added together, or in caſe the perpendicular fall without the *triangle*, be ſubtracted from each other, you will have the angle required B.

E. gr.	Whole ſine	10000000
	Co-ſine of AB	95963154
	Sum	195963154
	Co-tang. of A	100252805

Co-tang. of ABE 95710349. The number correſponding to which in the tables, is 20° 25′ 35″. AB therefore is 69° 34′ 25″.

Co-ſine of ABE	95428300
Co-tang. of BC	100141529
Sum	196269829
Co-tang. of AB	96330085

Co-ſine of EBC 99938544. The number correſponding to which in the tables, is 80° 24′ 26″. Therefore ABC is 79° 9′ 59″.

4. Given two angles A 43° 20′, and B 79° 9′ 59″, together with the adjacent ſide AB 66° 45′, to find the ſide BC oppoſite to one of them.

From one of the given angles B, let fall a perpendicular EB, to the unknown ſide AC; and in the rectangled *triangle* ABE from the given angle A, and hypothenuſe AB, find the angle ABE; which ſubtracted from the angle ABC, leaves the angle EBC. But if the perpendicular ſhould fall without the *triangle*, the angle ABC ſhould have been ſubtracted from ABE. Since as the perpendicular BE is taken for one of the lateral parts, the middle part in the *triangle* ABE is the angle B, and the conjoint part AB; in the *triangle* EBC the middle part is the angle B, and the conjunct part BC; the co-tangent of the ſide BC is found by ſubtracting the co-ſine of EBA, from the ſum of the co-tangent of AB, and the co-ſine of EBC.—The example of the preceding caſe is eaſily applied to this.

5. Given two ſides AB 66° 45′, and BC 39° 29′, with the angle A oppoſite to one of them, 43° 20′, to find the third ſide AC.

Letting fall, as before, the perpendicular BE; in the rectangled *triangle* ABE, from the given angle and hypothenuſe AB, find the ſide AE. Since aſſuming BE for a lateral part in the *triangle* AEB, AB is the middle part, and AE the ſeparate part; and in the *triangle* BEC, BC is the mean part, and EC a disjunct part; the co-ſine of EC is found by ſubtracting the co-ſine of AB from the ſum of the co-ſines of AE and CB. If then the ſegments AE and EC be added together, or in caſe the perpendicular fall without the *triangle*, be ſubtracted from each other, the ſide AC will be had.

6. Given two ſides AC 65° 30′ 46″, and AB 66° 45′, together with the included angle A 43° 20′, to find the third ſide BC oppoſite thereto.

Letting fall the perpendicular BE, find, in the rectangled *triangle*, the ſegment AE, which ſubtracted from AC, leaves EC. If the perpendicular fall without the *triangle*, AC is to be ſubtracted from AE. Since by aſſuming the perpendicular BE for a lateral part in the *triangle* AEB, AB becomes a middle part, and AE a ſeparate part: in the *triangle* EBC, CB is the middle part, EC a ſeparate part: the co-ſine of BC is found by ſubtracting the co-ſine of AE from the ſum of the co-ſines of AB and EC.

7. Given two angles A 43° 20′, and B 79° 9′ 59″, together with the ſide CB 39° 29′, oppoſite to one of them, to find the ſide AB adjacent to both.

Letting fall the perpendicular CD from the unknown angle C, to the oppoſite ſide AB; and that falling within the *triangle*; from the given angle B, and the hypothenuſe BC, ſeek in the rectangled *triangle* BCD for the ſegment BD. Since aſſuming the perpendicular CD for a lateral part in the *triangle* CDB, DB is the mean part, and the angle B a conjunct part; and in the *triangle* CDA, AD is the middle part, and the angle A a conjunct part: the ſine of the ſegment AD is found by ſubtracting the co-tangent of the angle B from the ſum of the ſine of DB, and the co-tangent of the angle A. If then the ſegments AD and DB be added, or in caſe the perpendicular fall without the *triangle*, be ſubtracted from each other, the reſult will be ſide AB required.

8. Given two ſides AB 66° 45′, and BC 39° 29′, with the included angle 79° 9′ 59″, to find the angle A oppoſite to one of them.

Letting fall the perpendicular CD, find the ſegment BD, as in the preceding problem. This ſubtracted from AB leaves AD. If the perpendicular fall without the *triangle*, AB is to be added to DB. And ſince by aſſuming the perpendicular CD for a lateral part in the *triangle* CDB, BD is the middle part, and the angle B a conjoint part; and in the *triangle* CDA, AD is the middle part, and the angle A a conjoint part: the co-tangent of the angle A is found by ſubtracting the ſine of DB from the ſum of the co-tangent of the angle B, and of the ſine of AD.

9. Given two angles A 43° 20′, and B 79° 9′ 59″, together with the adjacent ſide AB 66° 45′, to find the angle C oppoſite to the ſame.

From one of the given angles B, letting fall the perpendicular BE, to the oppoſite ſide AC; in the rectangled *triangle* ABE, from the given angle A, and hypothenuſe AB, we find the angle ABE; which ſubtracted from ABC, leaves the angle EBC. In caſe the perpendicular fall without the *triangle*, ABC is to be ſubtracted from ABE. Since by aſſuming BE for a lateral part in the *triangle* CEB, the angle C is a middle part, and the angle CBE a disjunct part; and in the *triangle* ABE, the angle A is the middle part, and the angle ABE the disjoint part: the co-ſine of the angle C is found by ſubtracting the ſine of the angle ABE, from the ſum of the co-ſine of the angle A, and the ſine of EBC.

10. Given two angles A 43° 20′, and C 82° 34′, together with a ſide BA 66° 45′, oppoſite to one of them, to find the other angle.

From the ſought angle B let fall a perpendicular BE; and in the right-angled *triangle* AEB, from the given angle A, and hypothenuſe BA, find the angle ABE. Since aſſuming the perpendicular EB for a lateral part in the *triangle* ECB, the angle C is the middle part, and the angle CBE a disjunct part; and in the *triangle* ABE, the angle A is the middle part, and the angle ABE a disjunct part: the ſine of the angle EBC is found by ſubtracting the co-ſine of A from the ſum of the co-ſine of C, and of the ſine of ABE. If then ABE and EBC be added, or in caſe the perpendicular fall without the *triangle*, be ſubtracted from each other, the reſult will be the angle required ABC.

11. Given the three ſides, to find an angle oppoſite to one of them.—I. If one ſide AC (*fig.* 16.) be a quadrant, and the leg AB leſs than a quadrant, find the angle A: continue AB to F, till AF become equal to a quadrant; and from the pole A draw the arch CF, to cut the arch BF at right angles in F. Since in the rectangled *triangle* CBF, we have given the hypothenuſe BC, and the ſide FB, or its complement AB to a quadrant, we ſhall find the perpendicular CF, which being the meaſure of the angle CAB, that angle is found of courſe.

II. If one ſide AC be a quadrant, and the other AB greater than a quadrant, ſeek again the angle A: from AB ſubtract the quadrant AD, and from the pole A deſcribe the arch CD, cutting the arch CD at right angles in D. Since in the rectangled *triangle* CDB, the hypothenuſe BC, and ſide DB, or exceſs of the ſide AB beyond a quadrant, is given, the perpendicular CD will be found as before, which is the meaſure of the angle A required.

III. If the *triangle* be iſoſceles, and AC=CF, and the angle ACF be required, biſſect AF in D, and through D and C draw the arch DC. Since DC is perpendicular to AF, the angles A and F, and ACD and DCF are equal; from the hypothenuſe AC, and leg AD, given in the rectangled *triangle* ACD, we find the angle ACD; the double whereof is the angle required ACF: and from the ſame data may the angle A or F be found.

IV. If the *triangle* be ſcalenous, and the angle A (*fig.* 32.) be required; from C let fall the perpendicular CD, and ſeek the ſemi-difference of the ſegments AD and DB, by ſaying, as the tangent of half the baſe AB is to the tangent of half the ſum of the legs AC and CB, ſo is the tangent of their ſemi-difference to the tangent of the ſemi-difference of the ſegments AD and DB: add then the ſemi-difference of the ſegments to the half baſe, to find the greater ſegment; and ſubtract the ſame from the ſame for the leſs. Thus having in the rectangled *triangle* CAD, the hypothenuſe AC, and the ſide AD, the angle A is found thence. After the ſame manner is B found in the other CDB, from CB and DB given.

12. Given the three angles A, B and C, to find any of the ſides.—Since in lieu of the given *triangle*, another may be aſſumed, whoſe ſides are equal to the given angles, and the angles to the given ſides; this problem is reſolved after the ſame manner as the preceding one.

TRIANGLE, TRIANGULUM, in aſtronomy, a name common to two conſtellations; the one in the northern hemiſphere, called ſimply *triangulum*, or *triangulum cœleſte*; the other in the ſouthern hemiſphere, called *triangulum auſtrale*. See CONSTELLATION.

The ſtars in the northern *triangle* in Ptolemy's catalogue are 4; in Tycho's as many; in the Britannic 24: the longitudes, latitudes, magnitudes, *&c.* whereof, are as follow:

Names and Situation of the Stars.	Signs	Longitude			Latitude.			Mag.

TRIANGULAR *Compaſſes*, are ſuch as have three legs or feet, whereby to take off any triangle at once, much uſed in the conſtruction of maps, globes, *&c.* See COMPASSES.

TRIANGULAR *Numbers*, are a kind of polygonal numbers; being the ſums of arithmetical progreſſions, the difference of whoſe terms is 1. See POLYGONAL *Number*.

Thus—Of arithmetical progreſs 1 2 3 4 5 6
are formed triang. numb. 1 3 6 10 15 21.

TRIANGULAR *Quadrant*, is a ſector furniſhed with a looſe piece, whereby to make it an equilateral triangle. See SECTOR.

The calendar is graduated thereon, with the ſun's place, declination, and other uſeful lines; and by the help of a ſtring and a plummet, and the diviſions graduated on the looſe piece, it may be made to ſerve for a quadrant. See QUADRANT.

TRIANGULAR *Winding Stairs.* See STAIR.

TRIANGULARIS, in anatomy, a name given to two muſcles, in reſpect of their figure. See MUSCLE.

The *triangularis pectoris*, which has ſometimes the appearance of three or four diſtinct muſcles, ariſes from the inſide of the ſternum, and is implanted into the cartilages which join the four loweſt true ribs to the ſternum.

The action of this muſcle is very obſcure, ſince both the origination and inſertion are at parts not moveable, but together.—Dr. Drake conjectures it may conduce towards forming the neceſſary incurvation of the ſternum, and by its overtenſion in children, while the cartilages are ſoft, may occaſion that morbid acumination of the ſternum ſeen in rickety children.—Others ſuppoſe it may contract the cavity of the thorax in expiration.

TRIANGULARIS *labii.* See DEPRESSOR *labii ſuperioris.*

TRIARII, in the Roman militia, a kind of infantry, armed with a pike, a ſhield, a helmet and a cuiraſs; thus called, becauſe they made the third line of battle.

The *triarii* were alſo called *poſtſignani*, becauſe ranged behind the principes who bore the ſtandard in a legion.

Polybius diſtinguiſhes four kinds of forces in the Roman army: the firſt, called *pilati*, or *velites*, were a raw ſoldiery, lightly armed.—The *haſtati* or ſpear-men were a degree older, and more experienced. The third, called *principes*, princes, were ſtill older, and better ſoldiers than the ſecond.—The fourth were the eldeſt, the moſt experienced, and the braveſt: theſe were always diſpoſed in the third line, as a corps de reſerve, to ſuſtain the other two, and to reſtore the battle, when the others were broken or defeated.

Hence their name of *triarii:* and hence the proverb *ad triarios ventum eſt*, to ſhew that one is at the laſt, and hardeſt ſtruggle.

TRIAS *Harmonica*, or the *Harmonical* TRIAD, in muſic, a compound of three radical ſounds, heard all together; two whereof are a fifth and a third above the other, which is the fundamental. See CONCORD, *&c.*

The *triad* is properly a conſonance formed of a third and a fifth; which, with the baſs, or fundamental ſound, makes three different terms, whence the name *trias.*—That of *harmonical* is doubtleſs given it from that wonderful property of the fifth, which divides itſelf naturally into two thirds, both excellent, and perfectly harmonical; ſo that this one ſound diſpoſed between two others, makes two thirds at once, and of conſequence a double harmony. See FIFTH.

Hence it is, that in *trio's*, particularly, this concord is preferred to that which divides the octave into a fifth and a fourth: in regard here, if there be a concord on one ſide, there is a diſcord on the other; whereas in the former caſe the harmony is compleat on both ſides.

Of the three ſounds which compoſe the harmonical *triad*, the graveſt is called the *fundamental*, or *baſs*; the acuteſt, *i. e.* that which makes the fifth, and which terminates the concord upwards, is called the *excluded* or *higheſt* ſound; and that which divides the fifth ſo agreeably into two thirds, is called the *harmonical mean.*

The diviſion of the fifth into two thirds, may be performed two ways, *viz.* 1. Harmonically, when the greater third is loweſt, and the leſs above; in which caſe the *triad* is perfect and natural.

1. Arithmetically, when the leſs third is loweſt, and the greater above; in which caſe the *triad* is imperfect and flat. Both are good; but the latter not to be often uſed.

TRIBE, TRIBUS, in antiquity, a certain quantity or number of perſons; when a diviſion is made of a city or people into quarters, or diſtricts.

The city of Athens was divided into ten *tribes.*—The Jewiſh nation into twelve *tribes*, the deſcendants of the twelve ſons of Jacob, *viz.* the *tribes* of Judah, of Reuben, Gad, Aſher, Dan, Naphtali, Ephraim, Manaſſeh, Simeon, Levi, Iſſachar, Zebulun, and Benjamin.

Theſe, in effect, make thirteen *tribes*, from twelve patriarchs; by reaſon the poſterity of Joſeph was divided into two *tribes*, that of Manaſſeh, and that of Ephraim. See PATRIARCH.—There were ten of theſe *tribes* that revolted and followed Jeroboam.

The Roman people was at firſt only divided into three *tribes*; and from this number *three*, *tres*, it was that the word *tribe*, *tribus*, took its riſe.—This diviſion was accommodated by Romulus, to the ſeveral nations he had united: the firſt conſiſted of the Albans, the ſecond of the Sabins, and the third of a mixture of fugitives, who came to ſeek an aſylum at Rome.

Servius Tullus, fearing this partition might occaſion ſeditions, divided the inhabitants of Rome by cantons, not by nations, accordingly, he diſtributed the city into four quarters, or *tribes*; and by reaſon a great number of citizens had retired into the country about, of thoſe he compoſed 26 other *tribes*; ſo that from this time the Roman people conſiſted of 30 *tribes.*

In after-times, the number of *tribes* was increaſed to 35; but they then ceaſed to be ranged according to the quarters of the city.—The diſtribution depended on the cenſors, who formed their liſt at diſcretion, frequently confounding the country *tribes* with thoſe of the city.

A man was never abſolutely a Roman citizen, unleſs he had the *jus tribus*, *i. e.* till he were intitled to the honours of the magiſtrature, as alſo to a right of voting in aſſemblies of the people; and this was what they called *jus quiritium.*—Hence, the inhabitants of the municipal cities were only imperfect citizens, as being of no *tribe.* See MUNICIPAL, and CITIZEN. The freed-men were obliged to purchaſe this *right of tribe*, which did not otherwiſe belong to them, though they were citizens of Rome. See LIBERTUS.

The names of the 35 tribes were, 1. the Palatina; 2. the Suburana; 3. the Collina; 4. the Eſquilina; 5. the Romilia; 6. the Æmilia; 7. the Cruſtumina; 8. the Cornelia; 9. the Fabia; 10. the Galeria; 11. the Lemonia; 12. the Mentina, or Menenia; 13. the Ocriculana; 14. the Papiria; 15. the Pollia; 16. the Popilia; 17. the Pupinia; 18. the Sergia; 19. the Veientina; 20. the Voltinia; 21. the Claudia; 22. the Stellatina; 23. the Tromentina; 24. the Arnenſis; 25. the Sabatina; 26. the Pomptina; 27. the Publilia; 28. the Mæcia; 29. the Scaptia; 30. the Ouſentina; 31. the Falerina; 32. the Anienſis; 33. the Terentina; 34. the Velina; 35. the Quirina. In ancient authors, and inſcriptions, we meet with the names of others, *viz.* Pinaria, Sappinia, Camilla, Ceſtia, Cluentia, *&c.*

TRIBRACHYS,* in the ancient proſody, a foot of verſe, conſiſting of three ſyllables, and thoſe all ſhort—as, *Mĕlĭŭs.*

* The word is formed from the Greek, τρεις, *three*, and βραχυς, *ſhort.* See FOOT, *&c.*

Some of the ancients call this foot *trochæus.* See TROCHÆE.

TRIBUCH, and TREBUCHET, a tumbrel, or cucking-ſtool. See CUCKING-*Stool.*

TRIBUNAL, *Judgment-ſeat*, the ſeat of a judge. See JUDGE.

The *tribunal* in a court of juſtice, is properly the ſeat or bench whereon the judge, and his aſſociates are placed, for the adminiſtration of juſtice. See BENCH, JUSTICE, *&c.*

The word is Latin, and takes its origin from a ſeat raiſed from the ground, wherein the *tribune* of the Roman people was placed to adminiſter juſtice. See TRIBUNE.

TRIBUNAL, among the ancients, was alſo a place from whence the people were harangued.

Among the Romans it was an eminence in a temple, or the forum, as that called *pro roſtris*, where the people were harangued in *tribes.*

The French architects likewiſe uſe the word *tribune* for a gallery or eminence in a church, or other place, wherein the muſic is placed for a ſymphony or concert.

TRIBUNE, TRIBUNUS *plebis*, in antiquity, a Roman magiſtrate, choſen out of the commons, to protect them againſt the oppreſſions of the great, and to defend the liberty of the people againſt the attempts of the ſenate, and conſuls.

The Tribunes of the people, were firſt eſtabliſhed in the year of Rome 259. The firſt deſign of the creation was to ſhelter the people from the cruelties of uſurers, and to engage them to quit the Aventine mount, whither they had retired in diſpleaſure.

Their number, at firſt, was but two; but the next year, under the conſulate of A. Poſthumus Aruncius and Caſſius Viſcellinus, there were three more added; and this number of five was afterwards increaſed by L. Trebonius to ten.

The appellation *tribune* was given them, by reaſon they were at firſt choſen out of the *tribunes* of the army. See the article following.

The *tribunes* were, as it were, the heads and guardians of the people.—They called aſſemblies of the people when they pleaſed; and in thoſe aſſemblies frequently annulled the decrees of the ſenate. Nothing could be concluded without their conſent, which they expreſſed by ſubſcribing the letter T at the bottom of the decree. They had it in their power to prevent the execution of any decree, without giving any reaſon for it, and merely by ſubſcribing *veto.*—They ſometimes even called the conſuls and dictator to account for their conduct before the people.

Auguſtus himſelf was *tribune* for 37 years; Tiberius aſſumed the ſame quality; as likewiſe did his ſucceſſor, ſignifying the year of their *tribunate* on their medals and coins: but their deſign, herein, was only to poſſeſs themſelves of all the authority, that there might be no body to oppoſe them. See TRIBUNICIAN.

TRIBUNE, TRIBUNUS *militum*, or *militaris*, an officer in the Roman army, who commanded in chief over a body of forces, particularly the diviſion of a legion; much the ſame with our colonel, or the French meſtre de camp. See LEGION.

There is ſome diſtinction of the *tribunes*, into *laticlavii* and *anguſticlavii:* thoſe born of noble families were allowed, after they were made *tribunes* of a legion, to take the *latuſclavus*. See LATUSCLAVUS.—The reſt were only to wear the *anguſtuſclavus*; whence Suetonius takes care to inform us, that his father was *tribunus laticlavius* of the 13th legion.

Over theſe *tribunes* of legions and cohorts, there were other *tribunes* who commanded in the abſence of the conſuls, and who were inveſted with a conſular authority.—Budæus will have theſe to be much the ſame as the marſhals of France, or, at leaſt, lieutenants-general.

Romulus likewiſe eſtabliſhed a *tribune* of the cavalry, *tribunus equitum*, who was the ſame with the *magiſter equitum* under the dictators, the firſt officer after the kings. See MASTER.

The *tribunes* of the ſoldiery were of an elder ſtanding than thoſe of the people; thoſe latter being elected out of the former.—Varro will have it, they were called *tribunes*, becauſe, at firſt, they were only three in number in each legion, when the legion conſiſted of three thouſand men, taken out of the three tribes then on foot.—In proportion as the legion was increaſed, the number of *tribunes* was likewiſe increaſed to the number of ſix.

At firſt, the nomination lay in the general of the army; but in the year of Rome 391, it was appointed, that the people ſhould nominate one part, and the general another: the latter were called *Rufuli*, from Rutilius Rufus, who paſſed the law. Thoſe choſe by the people in the comitia, were called *comitiati:* they were indifferently either patricians or plebeians, and had the ſame marks of honour as the conſuls themſelves.—The *tribune of the pretorian cohorts* was the captain of the guards. See PRETORIAN.

TRIBUNE was alſo an appellation given to various other officers; as the, *tribuni ærarii, tribunes of the treaſury.*—*Tribune of the celeres*, the officer who commanded them.—*Tribuni fabricarum*, thoſe who had the direction of the making of arms.—*Tribuni marinorum, tribuni nolanorum, tribuni voluptatum*, mentioned in the Theodoſian Code, as intendants of the public ſhews and other diverſions.

The title of TRIBUNE, TRIBUNUS, was alſo given to the chief of each tribe. See TRIBE.

TRIBUNICIAN, TRIBUNICIUS, a term among antiquaries and medalliſts.—The *tribunician power* was the dignity, office, or authority of the tribune of the people. See TRIBUNE.

This power was aſſumed by the emperors, and makes one of the chief titles they bear on their medals: the quality was firſt introduced by Auguſtus, to keep the ſoveraign authority over the other magiſtrates, without either taking that of dictator or king. Indeed it was offered to Julius Cæſar, but he deſpiſed it. Auguſtus is the firſt who uſed it, and his ſucceſſors followed his example.—They reckon the years of their empire on their medals by thoſe of their *tribunician power*.

This power was ſometimes given them for a certain number of years, and ſometimes for ever. Sometimes the emperors would communicate the power to ſuch as they aſſociated, or as they intended to ſucceed them: and Tiberius held it fifteen years with Auguſtus. But this practice only obtained till the time of Valerian and Gallienus. After them we only find T R. P. II. in Claudius; T R. P. V. in Aurelian; and T R. P. in Probus.—This, however, is to be underſtood of medals; for in inſcriptions we find it after that time.

Cardinal Noris and F. Pagi have diſputed about this *tribunician* power, wherein it conſiſted.—The firſt maintains, that it did not at all differ from that of the ordinary tribunes, which conſiſted in three things: 1. In a right of oppoſing all the acts and reſolutions of the other magiſtrates. 2. In that it rendered their perſons ſacred and inviolable. 3. In a power of making edicts and laws.

F. Pagi aſſerts, that it made an addition to the power of the tribunes; that the privilege it conferred of making edicts, was more ample than that of the ordinary tribunes; beſides, that it carried with it a power of convening the ſenate at pleaſure.

M. Spanheim is of F. Pagi's opinion: he believes, that the *tribunician power* had much the advantage of the tribunate: 1. In that it was peculiar to the patricians, and did not reduce the perſon who held it to the degree of a plebeian. 2. In that it was not confined to the city of Rome alone, like the other, but extended throughout the empire, as well as the proconſular power, which was uſually annexed to it. 3. That the dignity of the tribunes was inferior to that of the pretors; whereas the *tribunician power* of the Cæſars conferred, according to Tacitus, a ſoveraign authority over all magiſtrates, and rendered ſuch as it was communicated to, equal to the emperors, and even their collegues in the empire: beſides the power of oppoſing the enterprizes of all the other magiſtrates, and that it rendered their perſons ſacred, and gave them a right to aſſemble and diſmiſs the ſenate, which were privileges the *tribunician power* had in common with the tribunes.

F. Hardouin thinks we ſhould diſtinguiſh two *tribunician powers*; the one civil, the other military; but the proof he brings thereof is very weak.—M. Spanheim ſays, his diſtinction is only founded on vain conjectures, none of which deſerve notice.

The learned are greatly divided as to the month and day whereon the *tribunician power* commenced: Sigonius and Petavius will have it begin on the 1ſt of January: others, as Perizonius, on the 5th of the calends of July: M. Toinard on the 4th of the ides of December: Onuphrius, cardinal Noris, F. Pagi, *&c.* on the day of the emperor's acceſſion to the empire; with this difference, that F. Pagi takes it to be on the 5th of the calends of the month wherein the emperor was proclaimed; and that this day was, for this reaſon, held ſacred among the Romans.

F. Hardouin thinks, that on medals the *tribunician power* commences on the aniverſary of the building of Rome, *viz.* the 11th of the calends of May; excepting on the Greek medals, wherein it begins in September, in regard this month, which began the Greek year, was near the time when the *tribunician power* was firſt conferred.

Of all theſe ſentiments the moſt probable is that of Onuphrius, *&c.* ſetting aſide the reſtriction of F. Pagi. See M. Spanheim, *Diſſert.* 12. *tom.* 2. *p.* 429.

TRIBUTA *Comitia*. See the article COMITIA.

TRIBUTARY, TRIBUTARIUS, one who pays tribute to another, in order to live in peace with him, or ſhare in his protection. See TRIBUTE.

The repulic of Raguſa is *tributary* to the grand Turk; ſo is the cham of Little Tartary, *&c.*

TRIBUTE, TRIBUTUM, a tax, or impoſt, which one prince or ſtate is obliged to pay to another, as a token of dependance; or in virtue of a treaty, and as a purchaſe of peace.

The Romans made all the nations they ſubdued, pay them *tribute.*—Mahomet laid it down as a fundamental of his law, that all the world ſhould pay him *tribute*.

In the ſtates of the grand Signior, Chriſtian children are taken in way of *tribute*, to make agemoglans, janizaries, *&c.* See JANIZARY, AGEMOGLAN, *&c.*

TRIBUTE is ſometimes alſo uſed for a perſonal contribution, which princes levy on their ſubjects by way of capitation, or poll-money. See TAX.

In this it differs from an *impoſt*, which is properly what is laid on merchandiſes. See IMPOST.

TRICENNAL. See the article TRENTAL.

TRICEPS, in anatomy, a muſcle of the thigh, having three originations, and as many inſertions; and which may therefore be conveniently divided into three muſcles, all ariſing from the os pubis, and inſerted into the linea aſpera of the thigh-bone, whereof they poſſeſs the greateſt part.—See *Tab. Anat.* (Myol.) *fig.* 1. *n.* 53. *fig.* 2. *n.* 36. *fig.* 6. *n.* 36. *fig.* 7. *n.* 26.—They alſo ſerve as adductores, and draw the thighs together.

TRICUSPIDES, in anatomy, an epithet given to three valves, ſituate at the entrance of the vena cava into the heart. See VALVE.

They open from without inwards, ſo as to let the blood of the cava paſs into the heart, but prevent its reflux into the cava. See HEART.

They are thus called from their figure, which is triangular; for which reaſon they are alſo called by the Greeks τριγλωχινες.

TRIDENT, Tridens, an attribute of Neptune; being a kind of ſcepter which the painters and poets put in the hands of that god, in form of a ſpear or fork with three teeth; whence the word. See Scepter.

The poets tell us, that Neptune makes the earth open, whenever he ſtrikes it with his *trident*.

Trident, among mathematicians, is uſed for a kind of parabola, by which Cartes conſtructed equations of ſix dimenſions. See Parabola.

TRIEMIMERIS, ΤΡΙΗΜΙΜΕΡΗΣ, *Semiternaria*; a kind of cæſura in Latin verſe, wherein, after the firſt foot of the verſe, there remains an odd ſyllable, which helps to make up the next foot.—As in, *Ille latus niveum molli fultus hyacintho.* See Cæsure.

TRIENNIAL, an epithet applied chiefly to offices or employments which laſt for three years.

Thus we ſay, a *triennial* government: moſt regular monaſteries have *triennial* ſuperiors; they elect new ones at the end of each three years.

In 1695, an act was made for *triennial* parliaments, *i. e.* for parliaments which ſhould be diſſolved, and the members be elected anew, every three years. Till that time, the king had it in his power to prorogue and continue his parliaments as long as he pleaſed.—This opened a door to corruption, which the *triennial* bill was intended to prevent.

The *triennial* act has, from ſome other views, been ſince repealed: the great ſtruggles uſual at elections, the great ferment it uſually puts the nation into, the great expences upon that occaſion, with other conſiderations, determined the legiſlature, in 1717, to change *triennial* parliaments for ſeptennial ones. See Parliament.

TRIENS, in antiquity, a copper-money, of the value of one third of an as, which on one ſide bore a Janus's head, and on the other a water-rat. See As.

This was the piece of money uſed to be put in the mouths of the deceaſed, to pay Charon his fare for their paſſage into another life. See Money, and Coin.

Triens, or Triental, was alſo uſed for a drinking cup; and that which was ordinarily uſed.—It contained four cyathi. See Measure.

TRIERS. See the article Triours.

TRIFOLIUM, Trefoil, denotes any three-leafed graſs.

That moſt uſed in medicine is the *trifolium paluſtre*, or buckbean, which is very detergent, and uſed with ſucceſs in ſcorbutic, rheumatic and ſcrophulous habits.

The ordinary way of uſing it is by making a pretty ſtrong infuſion of the dried herb, in form of tea.

TRIGA, in antiquity, a kind of carr, or chariot, with three horſes. See Carr, &c.

The *triga*, in reality, was only drawn by two horſes; ſo that it was properly a biga; but it had, beſides, a third horſe tied to the others, like a led horſe, for change. See Biga.—Statius calls the third horſe, *equus funalis*; Heſychius, παρηορος; and Dionyſius Halicarnaſſeus, σειραιος.

We do not find the *triga* on any ancient monument; but it was a long time in uſe among the Romans, at their ludi circenſes.—The Greeks, who firſt introduced it, ſoon abandoned it.

TRIGAMY, a third marriage; or the ſtate of a perſon who has been married three times. See Marriage.

In the ancient church, *trigamy* was only allowed to ſuch as had no children by their former marriages.

If having children by one or both the former, they married again, after 40 years of age, they were excluded from communion for five years.—If they were only 40 years old, the penance was but four years. See Bigamy.

TRIGINTAL. See the article Trental.

TRIGLYPHS,* in architecture, a ſort of ornaments repeated at equal intervals in the Doric freeze. See Freeze, &c. See alſo Ditriglyph.

* The word is formed from the Greek, τριγλυφος, q. d. *three engravings*, from γλυφω, *ſculpo*.

Each *triglyph* conſiſts of two intire gutters, or channels, cut to a right-angle, called *glyphes*, and ſeparated by three interſtices, called by Vitruvius *femora*, from each other, as well as from two other half channels which are at the ſides.—See *Tab. Archit. fig.* 28. *lit. y.* See alſo Glyphe.

The ordinary proportion of *triglyphs*, is to be a module broad, and one and a half high.—But this proportion, M. le Clerc obſerves, ſometimes occaſions ill-proportioned intercolumnations in portico's; for which reaſon he chuſes to accommodate the proportion of his *triglyphs* to that of the intercolumns. See Intercolumnation.

The intervals between the *triglyphs* are called *metopes*. See Metope.—Under the channels, or glyphes, are placed guttæ, or drops. See Guttæ.

The *triglyphs* make the moſt diſtinguiſhing character of the Doric order.—Some imagine them originally intended for the conveyance of the guttæ that are underneath them: others fancy they bear ſome reſemblance to a lyre, and thence conjecture the ornament to have been originally invented for ſome temple ſacred to Apollo. See Doric.

Capital of a Triglyph. See the article Capital.

TRIGON,* Trigonus, in geometry, a triangle. See Triangle.

* The word is formed from the Greek, τριγωνος, *triangle*.

Trigon, in aſtronomy, denotes an aſpect of two planets, wherein they are 120 degrees diſtant from each other; called alſo *trine*. See Trine.

The *trigons* of Mars and Saturn are by aſtrologers held malefic aſpects. See Aspect, and Triplicity.

Trigon, Trigonon, was alſo a muſical inſtrument, uſed among the ancients. See Music.

The *trigon* was a kind of triangular lyre, invented by Ibycus. See Lyre.

TRIGONOMETRY, the art of finding the dimenſions of the parts of a triangle unknown, from other parts known: or the art whereby, from any three parts of a triangle given, all the reſt are found. See Triangle.

Thus, *e. gr.* from two ſides AB and AC and an angle B, we find by *trigonometry*, the two other angles A and C with the third ſide BC, *Tab. Trigonometry, fig.* 2.

The word literally ſignifies the *meaſuring of triangles*, formed from the Greek, τριγωνος, *triangle*, and μετρον, *meaſure*—Yet does not the art extend to the meaſuring of the area or ſurface of triangles, which comes under geometry: *trigonometry* only conſiders the lines, and angles thereof. See Triangle.

Trigonometry is of the utmoſt uſe in various mathematical arts:—it is by means hereof that moſt of the operations of geometry and aſtronomy are performed; without it the magnitude of the earth and the ſtars, their diſtances, motions, eclipſes, &c. would be utterly unknown.—*Trigonometry* therefore muſt be owned an art, whereby the moſt hidden things, and thoſe remoteſt from the knowledge of men, are brought to light. A perſon ignorant hereof can make no great progreſs in mixed mathematics; but will often be gravelled, even in natural philoſophy, particularly in accounting for the phenomena of the rainbow, and other meteors.

Trigonometry, or the ſolution of triangles, is founded on that mutual proportion which is between the ſides and angles of a triangle; which proportion is known, by finding the proportion which the radius of a circle has to certain other lines, called *chords*, *ſines*, *tangents*, and *ſecants*. See Radius, Chord, Sine, Tangent, and Secant.

This proportion of the ſines and tangents to their radius, is ſometimes expreſſed in common or natural numbers, which conſtitute what we call the *tables of natural ſines, tangents*, &c.—Sometimes it is expreſſed in logarithms, and in that caſe conſtitutes the tables of *artificial ſines*, &c. See Table, &c.

Laſtly, ſometimes the proportion is not expreſſed in numbers; but the ſeveral ſines, tangents, &c. are actually laid down upon lines or ſcales; whence the *line of ſines, tangents*, &c. See Line, and Scale.

Trigonometry is divided into *plain* and *ſpherical*: the firſt conſidering rectilinear triangles; and the ſecond ſpherical ones.—The firſt is of obvious and continual uſe in navigation, meaſuring, ſurveying, and other operations of geometry. See Measuring, Surveying, Sailing, &c.

The ſecond is only learned, with a view to aſtronomy and its kindred arts, geography and dialling.—It is generally eſteemed exceedingly difficult, by reaſon of the vaſt number of caſes wherewith it is perplexed; but the excellent Wolfius has removed moſt of the difficulties. That author has not only ſhewn how all the caſes of rectangled triangles may be ſolved the common way, by the rules of ſines and tangents; but has likewiſe laid down an univerſal rule, whereby all problems, both in plain and ſpherical rectangled triangles, are ſolved: and even obliquangular triangles he teaches to ſolve with equal eaſe.—His doctrine, ſee under the article Triangle.

Plain Trigonometry, is an art whereby, from three given parts of a plain triangle, we find the reſt. See Part.

The great principle of *plain trigonometry*, is, that in every plain triangle, the ſides are, as the ſines of the oppoſite angles.—See this principle applied to the ſolution of the ſeveral caſes of plain triangles, under the article Triangle.

Spherical Trigonometry, is the art whereby, from three given parts of a ſpherical triangle, we find the reſt. *E. gr.* whereby from two ſides and one angle, we find the two other angles, and the third ſide. See Spherics, and Spherical.

The principles of *ſpherical trigonometry*, as reformed by Wolfius, are as follow: 1. In every rectangled ſpherical triangle, ABC, rectangular at A, the whole ſine is to the ſine of the hypothenuſe, BC (*Tab. Trigonom. fig.* 33.) as the ſine of either of the acute angles, C, is to the ſine of the leg, oppoſite thereto AB; or, the ſine of the angle B, to the ſine of its oppoſite leg AC; whence we deduce, that the rectangle of the whole ſine into the ſine of one leg, is equal to the rectangle of the ſine of the angle oppoſite thereto, into the ſine of the hypothenuſe.

2. In every right-angled ſpherical triangle ABC, (*fig.* 31.) none of whoſe ſides is a quadrant, if the complements of the legs AB and AC to a quadrant, be conſidered as the legs themſelves; the rectangle of the whole ſine into the co-ſine of the middle part, is equal to the rectangle of the ſines of the disjunct parts, or extremes.

Hence, 1. If the ſines be artificial, that is, the logarithms of the natural ones; the whole ſine, with the co-ſine of the middle part, will be equal to the ſines of the disjunct parts.—2. Since, in the rectilinear triangle ABC (*fig.* 34.) the whole ſine is to the hypothenuſe BC, as the ſine of the angle B or C to the ſine of the oppoſite leg AC or AB: if, inſtead of the ſines of the ſides, we take the ſides themſelves; here, too, the whole ſine, with the co-ſine of the middle part AC or AB, will be equal to the ſine of the disjunct parts B or C and BC; *i. e.* to the ſine of B or C, and BC itſelf.

This, Wolfius calls *regula ſinuum catholica*, or the firſt part of the catholic rule of *trigonometry*; by means whereof all the problems of either *trigonometry* are ſolved, when the thing is effected by ſines alone.—My lord Napier had the firſt thought of ſuch a rule; but he uſed the complements of the hypothenuſe BC (*fig.* 22.) and the angles B and C for the hypothenuſe, and angles themſelves: ſo that the tenor of his catholic rules of ſines is this:

The whole ſine, with the ſine of the middle part, is equal to the co-ſines of the disjunct, or, as he calls them, oppoſite parts.—But, in this, that harmony between plain and ſpherical *trigonometry*, viſible in Wolfius's rule, does not appear.

3. In a rectangled ſpherical triangle ABC (*fig.* 31.) none of whoſe ſides is a quadrant; as the whole ſine is to the ſine of the adjacent leg AC; ſo is the tangent of the adjacent angle C to the tangent of the leg AB.

Whence, 1. as the co-tangent of the angle C, is to the whole ſine, as the whole ſine is to the tangent of the angle C, ſo is the ſine of AC to the tangent of AB; therefore the co-tangent of the angle C, will be to the whole ſine, as the ſine of the leg adjacent thereto, AC, is to the tangent of the oppoſite one AB. 2. The rectangle, therefore, of the whole ſine, into the ſine of one leg AC, is equal to the rectangle of the tangent of the other leg AB, into the co-tangent of the angle C, oppoſite to the ſame. And, in like manner, the rectangle of the whole ſine, into the ſine of the leg AB, is equal to the rectangle of the tangent of the leg AC into the co-tangent of the angle B.

4. In every right-angled ſpherical triangle, ABC, none of whoſe ſides is a quadrant; if the complements of the legs AB and AC to a quadrant, or their exceſſes beyond a quadrant, be conſidered as the legs themſelves; the rectangle of the whole ſine, into the co-ſine of the middle part, will be equal to the rectangle of the co-tangents, of the conjunct parts.

Hence, 1. If the ſines and tangents be artificial; the whole ſine, with the co-ſine of the middle part, is equal to the co-tangents of the contiguous parts. 2. Since in a rectilinear, right-angled triangle, we uſe the tangents, when from the legs AB and AC (*fig.* 34.) given, the angle C is to be found; and in that caſe the whole ſine is to the co-tangent of C, *i. e.* to the tangent of B, as AB to AC; therefore, alſo, in a rectilinear triangle, if for the ſines and tangents of the ſides be taken the ſines themſelves; the whole ſine, with the co-ſine of the middle part, *i. e.* with AC, is equal to the co-tangents of the conjunct parts, *i. e.* to the co-tangent of C, or tangent of B and the ſide AB.

This, Wolfius calls *regula tangentium catholica*, and conſtitutes the other part of the catholic rule of *trigonometry*; whereby all problems in each *trigonometry*, where tangents are required, are ſolved.

My lord Napier's rule to the like effect, is thus:—That the whole ſine, with the ſine of the middle part, is equal to the tangents of the contiguous parts.

It is, therefore, a catholic rule, which holds in all *trigonometry*; that in a rectangled triangle (*notatis notandis*, i. e. the complements of the legs AB and AC, being conſidered as legs themſelves, and in rectilinear triangles, the ſides themſelves being taken for the ſines and tangents of the ſides.) The whole ſine with the co-ſine of the mean or middle part is equal to the ſines of the disjunct or ſeparate parts, and the co-tangents of the conjunct or contiguous parts.

For an illuſtration and application of this rule, in the ſolution of the various caſes of ſpherical triangles. See Triangle.

Characters in Trigonometry. See Character.

TRIHING, or Thrihing,* from the Saxon, Ðꞃihinge, an extent containing three, or four hundreds, or the third part of a ſhire, or province. See Tithing.

* Mr. Thoreſby thinks the word ought to be written *Thrithing*. See *Thoreſb. Ducatus Leodenſ.* p. 85.

The word is alſo uſed for a court held within that circuit, which was the ſame with what we now call a *court-leet*, which is above a court-baron, and inferior to the county-court. See Court, Leet, *&c.*

TRILLION, in arithmetic, the number of a billion of billions. See Numeration.

After billions, we reckon by *trillions*, which makes a claſs of numeration, and is divided, like the other claſſes, into three places: thus we ſay, *trillions*; *tens of trillions*; *hundreds of trillions*, &c.

TRIM *of a ſhip*, is her beſt poſture, proportion of ballaſt, and hanging of her maſts for ſailing.

Hence, to find the beſt way of making a ſhip ſail ſwiftly, is to find her *trim*.

To Trim *a boat*, is to ſet the paſſengers ſo as to keep the boat even on both ſides.

TRIMACRUS, or Trimacer, in the ancient proſody, a foot in verſe, conſiſting of three long ſyllables. See Foot.

TRIMILCHI, a name by which the Engliſh Saxons called the month of May; becauſe they milked their cattle three times a day in that month.

TRIMMERS, in architecture, pieces of timber framed at right angles to the joints, againſt the ways for chimneys, and well-holes for ſtairs.

TRINE *dimenſion*, or *threefold dimenſion*, includes length, breadth and thickneſs. See Dimension.

The *trine* dimenſion is peculiar to bodies or ſolids. See Body, Solid, *&c.*

Trine *in aſtrology*, is the aſpect or ſituation of one ſtar with regard to another, when they are diſtant 120 degrees,—as the arch AB (*Tab. Aſtronomy, fig.* 3.) which is a third of a circle, and its ſubtenſe AB, a ſide of an equilateral triangle ABC inſcribed in the ſphere. See Aspect.

It is alſo called *trigon*, and ſignified by the character Δ. See Trigon.

TRINGLE,* in architecture, a name common to ſeveral little ſquare members, or ornaments; as reglets, liſtels and platbands. See Reglet, Listel, *&c.*

* The word is French, where it ſignifies the ſame.

Tringle is more particularly uſed for a little member fixed exactly over every triglyph, under the plat-band of the architrave; from whence hang down the guttæ or pendant drops. See Triglyph, and Guttæ.

TRINITARIANS, a term uſed very variouſly, and arbitrarily—frequently it ſtands as a common name for all heretics who have ſentiments on the myſtery of the Trinity, different from thoſe of the catholic church. See Trinity.

Sometimes it is more immediately reſtrained to ſome one or other particular claſs of heretics.—Thus *trinitarians* are frequently confounded with *unitarians*. See Unitarians, Socinians, *&c.*

Sometimes it is even applied to the orthodox themſelves, in contradiſtinction to the *antitrinitarians*, who deny or impugn the doctrine of the Trinity.—Thus the Socinians and others uſed to call the Athanaſians, *trinitarians*. See Antitrinitarians.

Trinitarians alſo denote an order of religious, inſtituted in honour of the Trinity, for redeeming of Chriſtian captives from the infidels; vulgarly called *mathurins*, and brothers of the *redemption*.

They are cloathed in white, and bear on the ſtomach a croſs, partly red and partly blue; by which three colours, white, red and blue, is ſuppoſed to be repreſented, the myſtery of the Trinity.

The *trinitarians* make it their buſineſs to go and ranſom Chriſtians held in ſlavery in the republics of Algiers, Tunis and Tripoly, and the ſtates of Morocco.—They have a rule peculiar to themſelves; though ſeveral hiſtorians rank them among the obſervers of the rule of St. Auguſtin.

The order had its riſe in 1198, under the pontificate of Innocent III. The founders were John de Matha and Felix de Valois: the firſt of Faucon in Provence; the ſecond, not of the royal family of Valois, as ſome have imagined; but thus called, in all probability, as being a native of the country Valois. Gauthier of Chatillon was the firſt who gave them a place in his lands to build a convent; which afterwards became the chief of the whole order: Honorius III. confirmed the rule. Urban IV. appointed the biſhop of Paris and others to reform them: they did it; and the reform was approved, in 1267, by Clement IV.

This order poſſeſſes about 250 convents, divided into thirteen provinces; whereof ſix are in France, three in Spain, one in Italy, and one in Portugal.—Formerly, there was one in England, another in Scotland, and a third in Ireland.

In the general chapters held in 1573 and 1576, a reform was ordered, and begun ſome time afterwards by Julian de Nantonville, and Claude Aleph, two hermits of St. Michael, but now permitted by pope Gregory to take the habit of the Trinity; upon which their hermitage was converted into a houſe of the order.

In 1609, pope Paul allowed them to build new houſes, and to introduce the reform into the old ones. In 1635, Urban VIII. by a brief, appointed the cardinal de Rochefoucault to introduce the reform into all the houſes of the order; which was done accordingly, by a ſentence containing the reform in eight articles; the principal whereof were, that they ſhould obſerve the primitive rule approved of by Clement IV. ſhould abſtain from fleſh, uſe woollen ſhirts, have mattins at midnight, *&c.* In 1554, there was alſo a reform made among thoſe of Portugal.

The habit of the *trinitarians* is different in different countries; and that of the reformed different from the reſt.

Bare-footed TRINITARIANS, are a reform of this order, made in Spain in a general chapter, held in 1594, where it was reſolved, that each province ſhould eſtabliſh two or three houſes, where the primitive rule ſhould be obſerved, and where the religious ſhould live up to a greater auſterity, uſe coarſer cloaths, *&c.* and yet ſhould have the liberty of returning to their ancient convent when they thought fit.

Dom. Alvares Baſan, intending to found a monaſtery at Valdepegnas, and deſiring to have it occupied by bare-footed religious, it was agreed to add nudity of feet to the reform, that the *trinitarians* might have the benefit of that eſtabliſhment.—The reform afterwards grew into three provinces, and was at length introduced into Poland and Ruſſia, and thence into Germany and Italy.

There are alſo *bare-footed trinitarians* in France, eſtabliſhed by F. Jerom Hallies, who being ſent to Rome to ſolicit the firſt reform mentioned above; not content therewith, carried it further, and obtained a permiſſion of pope Gregory, to add a coarſe habit, and nudity of feet thereto. He began with the convent of St. Dionyſius at Rome, and thoſe of Aix in Provence.

In 1670 there were houſes enough of this reform to make a province, and accordingly they held their firſt general chapter the ſame year.

There are alſo nuns of the TRINITARIAN order, eſtabliſhed in Spain by St. John de Matha himſelf, who built them a convent in 1201.—Thoſe who firſt took the habit were only oblatæ, and made no vows; but in 1201 the monaſtery was filled with real religious, under the direction of the infanta Conſtantia, daughter of Peter II. king of Arragon, who was the firſt religious, and the firſt ſuperior of the order.

There are alſo bare-footed nuns of this order, eſtabliſhed at Madrid about the year 1612, by Frances de Romero, daughter of Julian de Romero, lieutenant-general in the Spaniſh army. Her deſign being to found a monaſtery of bare-footed Auguſtines, ſhe aſſembled a number of maids for that end, lodging them, for the time, in a houſe belonging to the monaſtery of bare-footed *trinitarians* in the neighbourhood.

Here, attending at the church of thoſe fathers, and being under the direction of F. John Baptiſt of the conception, their founder, the knowledge of that father, and the ſervices he did them, made them change their reſolution of becoming Auguſtines, and demand of their director the habit of his order, which he gave them.

But the order oppoſing their deſign, and refuſing to take them under its juriſdiction, they addreſſed themſelves to the archbiſhop of Toledo, who allowed them to live according to the rule of that order; ſo that they took the habit a-new in 1612, and began their noviciate.

Laſtly, there is a third order of *trinitarians*. See THIRD *Order*.

TRINITY, TRINITAS, TRIAS, TRIAD, in theology, the ineffable myſtery of three perſons in one God; Father, Son, and Holy Spirit. See GOD, PERSON, *&c.*

It is an article in the chriſtian faith, that there is one God, an unity in nature and eſſence, and a *Trinity* of Perſons.—The term *trinity* implies the unity of three, the unity of three divine perſons really different, and the identity of an indiviſible nature: the *trinity* is a ternary of divine perſons of the ſame eſſence, nature, and ſubſtance.

Theology teaches, that there is in God one eſſence, two proceſſions, three perſons, four relations, five notions, and the circuminceſſion, which the Greeks call *perichoreſis*. Of each whereof we ſhall enlarge a little.

There is, then, one ſingle eſſence, one divine nature, which is infinite, eternal, ſpiritual; which ſees all things, which knows all things, which is every where, all-mighty, and which created all things of nothing. See GOD.

In this God there are two proceſſions, or emanations, *viz.* that of the Son, and that of the Holy Spirit: the firſt is called *generation*, and the ſecond *ſpiration*. See GENERATION, *&c.*

The Son proceeds from the Father by way of knowledge; for God in knowing himſelf eternally, neceſſarily, and infinitely, produces a term, an idea, notion or knowledge of himſelf, and all his adorable perfections, which is called his *Word*, his *Son*, who is equal to him in all things, eternal, infinite, and neceſſary as his Father.—The Father regards the Son as his Word, and the Son has a regard to the Father as his principle: and in thus reſpecting each other eternally, neceſſarily, and infinitely, they love each other, and produce an act of their mutual love: the term of that love is the Holy Spirit, who proceeds from the Father and the Son by way of ſpiration, love, and impulſion; who is alſo equal in every thing to the Father and the Son. See FATHER, SON, and SPIRIT.

Each divine proceſſion eſtabliſhes two relations: the one on the ſide of the principle, or that from whence; and the other on that of the term, or that to which.—Hence, as there are two proceſſions in God, there muſt be four relations; the paternity, the filiation, the active ſpiration, and the paſſive.

The *paternity* is a relation founded in what the ſchool divines call the notional underſtanding; in which the Father ſtands related to the ſecond perſon, the Son.—The filiation is the relation wherein the ſecond perſon, *viz.* the Son, refers to the Father. See PATERNITY, *&c.*

The active ſpiration, is the relation founded in the notional act of the will, whereby the firſt and ſecond perſons regard or refer to the third:—the paſſive ſpiration or proceſſion, taken in its ſtrict ſenſe, is the relation whereby the third perſon regards, and is referred to the firſt and ſecond.—Hence it appears, that there are in God, four relations, as we have already ſaid, and five notions, as we ſhall ſhew hereafter.

Perſon is defined an individual, reaſonable, or intellectual ſubſtance; or an intellectual and incommunicable ſubſtance. See PERSON.

The hypoſtaſis, or ſubſtance, is what conſtitutes the perſon.—There are then in the holy *trinity* three perſons, Father, Son, and Holy Spirit, which have all things in common, except their relations; whence that axiom in theology comes to have place, in the divine perſons there is no diſtinction where there is no oppoſition of relation: and hence it follows, that if power be ſometimes attributed to the Father, wiſdom to the Son, and goodneſs to the Holy Spirit; or if ſins of infirmity or weakneſs be ſaid to be againſt the Father, ſins of ignorance againſt the Son, and ſins of malice againſt the Holy Spirit, it is only ſpoke by way of appropriation, and not of propriety; for all thoſe things are in common: whence that axiom, the works of the holy *Trinity* are common and undivided, (*i. e.* they agree to all the divine perſons) but not their productions *ad intra* (as they are called) by reaſon they are relative.

By appropriation we mean the giving of ſome common attribute to a certain divine perſon, on account of ſome ſuitableneſs or agreement. Thus, in the ſcriptures, in the apoſtles, and the Nicene creed, omnipotence is attributed to the Father, becauſe he is the firſt principle, and a principle without origin, or higher principle.—Wiſdom is attributed to the Son, becauſe he is the term of the divine underſtanding, to which wiſdom belongs: goodneſs is attributed to the Holy Spirit, as being the term of the will, to which goodneſs belongs.

Some divines give other reaſons of ſuch kinds of attributions and appropriations, *viz.* that it is to ſtave off thoſe imperfections from the divine perſons which are found in the creatures: for created fathers are weak, drooping, and impotent; wherefore to ward off this imperfection from the firſt perſon, he is peculiarly ſaid to be *almighty*.

Again, created ſons are generally imprudent; wherefore, to remove this imperfection from the ſecond perſon, he is ſaid to be *wiſe*, or *eternal wiſdom*.

Laſtly, great minds or ſpirits, among created beings, are frequently wicked; wherefore, to remove this imperfection from the third perſon, *goodneſs* is attributed to him.

The Father is the firſt perſon in the holy *trinity*, by reaſon the Father alone produces the Word by the way of *underſtanding*: and with the Word produces the Holy Spirit, by way of *will*.

Here is to be obſerved, that the Holy Spirit is not thus called from his ſpirituality, that being common and eſſential to all three Perſons, but from the paſſive ſpiration which is peculiar to him alone.

Add, that when one perſon in the holy *trinity* is called *firſt*, another *ſecond*, and another *third*, it muſt not be underſtood of a priority of time, or of nature, which would imply ſome dependance; but of a priority of origin and emanation, which conſiſts in this, that one perſon produces the other in ſuch manner, as that the perſon which produces cannot be, or be conceived, without that produced.

From theſe things it follows, that in the holy *trinity* there are five notions (underſtanding by *notion* the peculiar manner whereby one divine perſon is diſtinguiſhed from another.) The notions then whereby the Father is diſtinguiſhed from the Son and Holy Ghoſt, are innaſcibility, and paternity.—That whereby the Son is diſtinguiſhed from the two other divine perſons, is filiation.

Active ſpiration diſtinguiſhes the Father and the Son from the Holy Spirit, and paſſive ſpiration is that whereby the Holy Spirit is diſtinguiſhed from the Father and Son.

The circuminceſſion or perichoreſis, is the intimate in-exiſtence of the divine perſons, or their mutual in-dwelling in each other: for though they be really diſtinct, yet are they conſubſtantial; whence it is that Jeſus Chriſt ſays in St. John, chap. xiv. *Believe ye not that I am in the Father, and the Father in me?* Identity of eſſence, which the Greeks call ὁμȣσια, and conſubſtantiality, with a diſtinction of perſons, are neceſſary to this circuminceſſion. See CIRCUMINCESSION.

Many of the heathens ſeem to have had a notion of a *Trinity*.—*Steuch. Eugub. de Peren. Philoſ.* lib. 1. cap. 3. obſerves, that there is nothing in all theology more deeply grounded, or more generally allowed by them, than the myſtery of the *trinity*. The Chaldeans, Hebrews, Phœnicians, Greeks, and Romans, both in their writings and their oracles, acknowledged that the ſupreme being had begot another being from all eternity, which they ſometimes called the *Son of God*, ſometimes the *Word*, ſometimes the *Mind*, and ſometimes the *Wiſdom* of *God*, and aſſerted it to be the Creator of all things. See SON.

Among the ſayings of the Magi, the deſcendants of Zoroaſter, this is one; Παντα εξετελεσε πατηρ και νω παρεδωκε δευτερω: *the Father finiſhed all things, and delivered them to the ſecond Mind.*—The Egyptians called their *trinity*, *hemphta*, and repreſented it by a globe, a ſerpent, and a wing diſpoſed into one hieroglyphic ſymbol.—Kircher, Gale, *&c.* ſuppoſe the Egyptians learned their doctrine of the *trinity* from Joſeph, and the Hebrews.

The philoſophers, ſays St. Cyril, owned three hypoſtaſes or perſons; they have extended their divinity to three perſons, and even ſometimes uſed the term *trias*, *trinity:* they wanted nothing but to admit the conſubſtantiality of the three hypoſtaſes, to ſignify the unity of the divine nature, in excluſion of all triplicity with regard to difference of nature; and not to hold it neceſſary to conceive any inferiority of hypoſtaſes.

In effect, Plato, and ſome of his followers, ſpeak of a *trinity* in ſuch terms, that the primitive fathers have been accuſed of borrowing the very doctrine from the Platonic ſchool; but F. Mourgues, who has examined the point, aſſerts, that nothing can be more ſtupid, than to ſuppoſe the Platonic *trinity* brought into the church; and to have recourſe to the Platoniſm of the fathers to diſcredit their authority with regard to this dogma. See PLATONISM.

Friary or Fraternity of the Holy **TRINITY**, is a ſociety inſtituted at Rome by St. Philip Neri in 1548, to take care of pilgrims coming from all parts of the world to that capital, to viſit the tombs of St. Peter and St. Paul. See FRATERNITY.

In order to this, they had a houſe wherein they entertained them for the ſpace of three days, and not only them, but poor people who were on the recovery, and who being turned too haſtily out of the hoſpitals, were expoſed to relapſes.

It was firſt ſet on foot in the church of St. Saviour in Campo, and conſiſted only of fifteen poor perſons, who met in that church the firſt Sunday of each month, to practiſe the exerciſes of piety preſcribed by the founder, and to hear the exhortations he there gave.

In 1558 pope Paul IV. gave the fraternity the church of St. Benedict, to which they gave the title of the *Holy Trinity*. Since that time, they have built cloſe by it a very ample hoſpital for pilgrims, and perſons on the recovery.

The fraternity is now very conſiderable, and moſt of the nobleſſe of Rome, of either ſex, have done it the honour to be members of it.

Congregation of the Holy **TRINITY**, is a congregation of twelve prieſts eſtabliſhed in the hoſpital of the fraternity juſt mentioned, to take care of pilgrims and others entertained therein.

The frequent change of prieſts in the hoſpital occaſioning a deal of diverſity in the ſpiritual conduct and inſtruction of the pilgrims, to render it more uniform, the guardians and adminiſtrators eſtabliſhed a congregation of twelve prieſts, who lodge in a quarter of the hoſpital, as in a monaſtery, and live there in community.

Order of the Holy **TRINITY**. See TRINITARIAN.

TRINITY *Sunday*, is the next Sunday after Whit-ſunday; thus called, becauſe on that day was anciently held a feſtival (as it ſtill continues to be in the Romiſh church) in honour of the Holy *Trinity*.—The obſervation of this feſtival was firſt enjoined by the council of Arles in 1260.

TRINITY *Houſe*, is a kind of college at Deptford, belonging to a corporation of ſea-faring perſons, who have power, by the king's charter, to take cognizance of ſuch as deſtroy ſea-marks, to correct the faults of ſailors, *&c.* and to take care of ſeveral other things belonging to navigation and the ſeas, the examination of young officers, *&c.* *anno* 8° Eliz.

TRINITY *Term*. See the article TERM.

TRINIUMGELD, or **THRINIUMGILD**, a compenſation uſed among our Saxon anceſtors for great crimes, which were not abſolved but by paying a fine thrice nine times. See GELD.

TRINODA *neceſſitas*, in our ancient cuſtoms, a three-fold neceſſary tax, to which all lands were liable, *viz. expeditio, & reparatio pontis, & arcis*; going to the wars, repairing of bridges, and of caſtles.

Theſe were the three exceptions anciently inſerted in the king's grants of lands to the church, after the words that freed them from all ſecular ſervice. See PONTAGE.

TRINODA, or **TRINODIA** *terræ*, in ſome ancient writers, denotes a quantity of land containing three perches. See PERCH.

TRINOMIAL, or **TRINOMINAL** *Root*, in mathematics, is a root conſiſting of three parts, or monomes, connected together by the ſigns $+$, or—See ROOT, and SQUARE.

Such is $x+y+z$, or $a+b-c$. See BINOMIAL.

TRIO, in muſic; a part of a concert wherein three perſons ſing; or more properly a muſical compoſition conſiſting of three parts. See COMPOSITION.

Trio's are the fineſt kind of compoſition, and theſe recitativo's are what pleaſe moſt in concerts. See CONCERT, HARMONY, *&c.*

TRIOCTILE, in aſtrology, an aſpect or ſituation of two planets with regard to the earth, when they are three octants, or eighth parts of a circle, *i. e.* 135 degrees diſtant from each other.

This aſpect, which ſome call the *ſeſquiquadrans*, is one of the new aſpects ſuper-added to the old ones by Kepler. See ASPECT.

TRIONES, in aſtronomy, a ſort of conſtellation, or aſſemblage of ſeven ſtars, in urſa minor; popularly called *Charles's Wane*. See URSA *minor*.

From the *ſeptem triones* the north pole takes the denomination *ſeptentrio*. See NORTH, POLE, *&c.*

TRIOURS, or **TRIERS**, in law, ſuch as are choſen by the court to examine whether a challenge made to the pannel of jurors, or any of them, be juſt or no. See JURY.

TRIP, a ſea term. A ſhip is ſaid to bear her topſails *a-trip*, when ſhe carries them hoiſted up to the higheſt.

TRIPARTITE, **TRIPARTITUS**, ſomething divided into three parts, or made by three parties; as, an indenture *tripartite*, *&c.* See INDENTURE.

TRIPARTITION, is a diviſion by three, or the taking the third part of any number, or quantity. See PARTITION, and DIVISION.

TRIPHTHONGUE, in grammar, an aſſemblage or concourſe of three vowels in the ſame ſyllable; as in *Quae*. See SYLLABLE.

Quintilian, *lib.* I. *cap.* 6. aſſerts, that there never was any ſyllable of three vowels, but that one of them was always turned into a conſonant: Scioppius aſſerts the contrary:—However this may be in the Latin and Greek, which were the only languages Quintilian underſtood, it is certain there are ſeveral languages in Europe, wherein *triphthongues* are in uſe. See DIPHTHONG.

TRIPLE, three-fold. See RATIO, and SUB-TRIPLE.

TRIPLE, in muſic, is one of the ſpecies of meaſure, or time. See TIME, and MEASURE.

Triple time conſiſts of many different ſpecies, whereof there are in general four, each of which has its varieties.—The common name of *triple* is taken hence, that the whole or half meaſure is diviſible into three equal parts, and is beaten accordingly.

The firſt ſpecies is called the *ſimple triple*, wherein the meaſure is equal to three ſemibreves, three minims, three crotchets, three quavers, or three ſemiquavers; which are marked thus, $\frac{3}{1}$, or $\frac{3}{2}$, $\frac{3}{4}$, $\frac{3}{8}$, $\frac{3}{16}$; but the laſt is not much uſed, except in church muſic.

In all theſe, the meaſure is divided into three equal parts or times, called thence *triple time*, or the meaſure of *three times*, whereof two are beat down, and the third up.

The ſecond ſpecies is the *mixt triple:* its meaſure is equal to ſix crotchets, or ſix quavers, or ſix ſemiquavers, and accordingly marked $\frac{6}{4}$, or $\frac{6}{8}$, or $\frac{6}{16}$; but the laſt is ſeldom uſed. The meaſure here is uſually divided into two equal parts or times, whereof one is beat down, and one up; but it may alſo be divided into ſix times, whereof the firſt two are beat down, and the third up; then the next two down, and the laſt up, *i. e.* each half of the meaſure is beat like the *ſimple triple* (on which account it may be called the *compound triple*;) and becauſe it may be thus divided either into two or ſix times (*i. e.* two *triples*) it is called *mixed*, and by ſome the *meaſure of ſix times*.

The third ſpecies is the *compound triple*, conſiſting of nine crotchets, or quavers, or ſemiquavers, marked $\frac{9}{4}$, $\frac{9}{8}$, $\frac{9}{16}$, the firſt and laſt are little uſed; ſome alſo add $\frac{9}{1}$, $\frac{9}{2}$, which are never uſed.

Some authors add other two, *viz.* ſix ſemibreves, and ſix minims, marked $\frac{6}{1}$ or $\frac{6}{2}$; but theſe are not in uſe.

This meaſure is divided either into three equal parts or times, whereof two are beat down, and one up; or each third part may be divided into three times, and beat like the ſimple *triple*; on which account it is called the *meaſure of nine times*.

The fourth ſpecies is a compound of the ſecond ſpecies, containing twelve crotchets, or quavers, or ſemiquavers, marked $\frac{12}{4}$, $\frac{12}{8}$, $\frac{12}{16}$, to which ſome add $\frac{12}{1}$ and $\frac{12}{2}$, which are never uſed; nor are the firſt and third much uſed, eſpecially the latter. The meaſure here may be divided into two times, and beat one down, and one up; or each half may be divided, and beat as the ſecond ſpecies, either by two or three; in which caſe it will make in all twelve times, and hence is called *the meaſure of twelve times*.

The French and Italian authors make a great many more ſpecies and diviſions of *triple* time, unknown, or at leaſt, unregarded by our Engliſh muſicians, and therefore not ſo neceſſary to be dwelt upon here.

TRIPLE *quartan fever*. See the article FEVER.

TRIPLE *Inciſion*. See the article ENGRAFTING.

TRIPLICATE *Ratio*, is the ratio which cubes bear to each other. See CUBE.

This ratio is to be diſtinguiſhed from *triple* ratio, and may be thus conceived.—In the geometrical proportionals 2, 4, 8, 16, 32; as the ratio of the firſt term (2) is to the third (8) duplicate of that of the firſt to the ſecond, or of the ſecond to the third: ſo the ratio of the firſt to the fourth is ſaid to be *triplicate* of the ratio of the firſt to the ſecond, or of that of the ſecond to the third, or that of the third to the fourth, as being compounded of three equal ratio's. See RATIO.

TRIPLICATIO, TRIPLICATION, in civil law, is the ſame with ſur-rejoinder in common law. See SUR-REJOINDER.

TRIPLICITY, or TRIGON, among aſtrologers, is a diviſion of the ſigns, according to the number of the elements, each diviſion conſiſting of three ſigns. See SIGN.

Triplicity is frequently confounded with *trine aſpect*; though, ſtrictly ſpeaking, the two are very different things: as *triplicity* is only uſed with regard to the ſigns; and *trine*, on the contrary, with regard to the planets. See TRINE.

The ſigns of *triplicity* are thoſe which are of the ſame nature, and not thoſe which are in trine-aſpect.—Thus Leo, Sagittary and Aries are ſigns of *triplicity*, becauſe thoſe ſigns are all ſuppoſed fiery.

TRIPLOIDES, a ſurgeon's inſtrument, with a three-fold baſis, uſed in the reſtoring great depreſſions of the ſcull. *Blanc.* See TREPANUM, and TREPANNING.

TRIPOD, TRIPOS, in antiquity, a famed ſacred ſeat or ſtool, ſupported by three feet, whereon the prieſts and ſibyls were placed to render oracles. See ORACLE.

It was on the *tripos* that the gods inſpired the Pythians with that divine fury and enthuſiaſm, wherewith they were ſeiſed at the delivering their predictions. See ENTHUSIASM, PYTHIAN, *&c.*

M. Spanheim obſerves, that on Roman medals, the *tripod* expreſſes ſome prieſthood, or ſacerdotal dignity.—A *tripod*, with a raven and a dolphin, is the ſymbol of the duumviri, deputed for keeping of the ſibyllin oracles, and for conſulting them on occaſion.

TRIPODIUM.—In the laws of Hen. I. occurs this paſſage —*In quibus vero cauſis triplicem ladam haberet, ferat judicium* tripodii, *i. e.* 60 ſolid. The meaning whereof, according to ſome, is, that as for a ſmall offence, the compoſition was twenty ſhillings; ſo for a great offence, which was to be purged *triplici lada*, the compoſition was three times twenty ſhillings, called *tripodium.*

TRIPOLI, or TRIPOLY, *Terra* TRIPOLITANA, a kind of dry, ſoft ſtone, or chalk, of a citron colour, uſed in poliſhing the lapidaries, goldſmiths, copper-ſmiths, and glaſs-grinders works. See GLASS, GRINDING, POLISHING, *&c.*

Some imagine *tripoli* to be a common ſtone burnt and calcined by the ſulphurous exhalations which happen to be under the mines where it is found: of theſe mines there are a number in divers parts of Europe, particularly in Italy, where the *tripoli* is very good.—Others, with more probability, take it for a native earth. See EARTH.

TRIPPING, in heraldry, denotes the quick motion of all ſorts of deer, and ſome other creatures, repreſented with one foot up, as it were on a trot. See COUNTER-TRIPPING.

In ſpeaking of lions, they ſay *paſſant*, inſtead of *tripping*. See PASSANT.

TRIPTHONGUE. See the article TRIPHTHONGUE.

TRIPTOTES,* in grammar, defective nouns, which have only three caſes: ſuch is, *fors*, *fortis*, *forte*; or *dica*, *dicam*, *dicas*.

* The word is compounded of τρεις, *three*, and πτωσις, *caſe*.

TRIREME, or TRIREMIS, in antiquity, a galley with three ranks of oars on a ſide. See GALLEY.

TRISACRAMENTARIANS, or TRISSACRAMENTARIANS, an appellation given to a ſect in religion, who admit of three ſacraments, and no more. See SACRAMENT.

There have been ſeveral *triſacramentarians* among the proteſtants, who allowed of baptiſm, the euchariſt, and abſolution, for ſacraments.—The Engliſh are often miſrepreſented by foreigners as *triſacramentarians*, from an opinion that they allow ordination a ſacrament. See ORDINATION.

TRISAGION,* or TRISAGIUM, in church-hiſtory, a hymn wherein the word *holy* is repeated three times. See HYMN.

* The word is Greek, τρισαγιον, compounded of τρεις, *three*, and ἅγιος, *ſanctus*, *holy*.

The proper *triſagion* is thoſe words *holy*, *holy*, *holy*, *Lord God of ſabaoth*, which we read in Iſaiah vi. 3. and in the Apocalypſe. From theſe words the church formed another *triſagion*, which is rehearſed in Latin and Greek, in the reſpective churches, to this effect: *Holy God*, *holy mighty*, *holy immortal! have mercy upon us.*

Petrus Fullenſis to this *triſagion* added, ὁ ςαυρωθεις δὺ ἡμας, *Thou who waſt crucified for us,—have mercy*, &c. thus attributing the paſſion not to the ſon alone, but to all the three perſons of the trinity, and pronouncing anathema to all ſuch as would not ſay the ſame. See THEOPASCHITE, and PATRIPASSIAN.

The uſe of the ſecond *triſagion* (excluſive of the addition of Fullenſis) began in the church of Conſtantinople, from whence it paſſed into the other churches of the eaſt, and afterwards into thoſe of the weſt.—Damaſcenus, Codin, Balſamon, and others, ſay it was in the time of the patriarch Proclus that it was firſt introduced, and on the following occaſion: there being a violent earthquake in the 35th year of the younger Theodoſius, the patriarch made a grand proceſſion, wherein, for ſeveral hours together, was ſung the Kyrie eleiſon, Lord have mercy upon us. While this was in hand, a child was taken up into the air, where, it ſeems, he heard the angels ſinging the *triſagion* juſt mentioned. He returned ſoon after, and told what he had heard: upon which they began to ſing that hymn, and the more willingly too, as they attributed the troubles they were then under, to the blaſphemies which the heretics of Conſtantinople uttered againſt the Son.—Aſclepiades, Cedrenus, pope Felix, Nicephorus, *&c.* relate the ſame ſtory.

Petrus Fullenſis, patriarch of Antioch, and a zealous partiſan of Neſtorius, endeavoured to corrupt the hymn, by the addition above-mentioned, *who ſuffered for us*; but in vain: it ſtill ſubſiſts in its primitive purity, both in the Latin, Greek, Ethiopic, and Mozarabic offices.

TRISECTION, or TRISSECTION, the dividing a thing into three. See DIVISION, SECTION, *&c.*

The term is chiefly uſed in geometry, for the diviſion of an angle into three equal parts. See ANGLE.

The *triſection of an angle* geometrically, is one of thoſe great problems, whoſe ſolution has been ſo much ſought by mathematicians for theſe two thouſand years; being, in this reſpect, on a footing with the quadrature of the circle, and the duplicature of the cube angle. See PROBLEM.

Several late authors have wrote of the *triſection* of the angle, and pretend to have found out the demonſtration thereof; but they have all committed paralogiſms. See ANGLE.

TRISMEGISTUS,* an epithet or ſurname given to one of the two Hermes's, or Mercuries, kings of Thebes, in Egypt, who was cotemporary with Moſes. See HERMES.

* The word is formed from τρις, *thrice*, and μεγιςος, *greateſt*.

Mercury, or Hermes *Triſmegiſtus*, is the latter of the two Hermes's: the former having reigned about the time of the deluge.—They are both of them repreſented as authors of many arts and inſtitutions of the Egyptians. See HERMETIC.

TRISMOS, ΤΡΙΣΜΟΣ, or ΤΡΙΓΜΟΣ, a convulſion of the muſcles of the temples, cauſing the teeth to gnaſh. See CONVULSION, *&c.*

TRISOLYMPIONICA,* ΤΡΙΣΟΛΥΜΠΙΟΝΙΚΗΣ, among the ancients, a perſon who had thrice bore away the prize at the Olympic games. See OLYMPIC.

* The word is compoſed of τρεις, *tres*, *three*, Ολυμπια, *Olympic games*, and νικη, *victory*.

The *triſolympionicæ*, or *triſolympionics*, had great privileges and honours allowed them.—Statues were erected to them, of the kind called *iconicæ*, which were modelled to the ſize and form of their perſons. See STATUE.

They were exempted from all taxes and incumbrances, and could never be marked with infamy.

TRISPAST,* TRISPASTON, in mechanics, a machine with thee pullies; or an aſſemblage of three pullies, for raiſing great weights. See PULLY.

* The word is compounded of τρεις, *three*, and σπαω, *traho*, *I draw*.

The *triſpaſton* is a ſpecies of polyſpaſton. See POLYSPASTON.

TRISSACRAMENTARIANS. See the article TRISACRAMENTARIANS.

TRISSECTION,	See the articles	TRISECTION.
TRISSECTING *Compaſſes*,		COMPASSES.

TRISTRA,* TRUSTRA, or TRISTA, in our old law-books, an immunity, whereby a man is excuſed from attending on the lord of a foreſt, when he is diſpoſed to chaſe within the foreſt; ſo that he cannot be compelled to hold a dog, follow the chace, nor ſtand at a place appointed, which otherwiſe he might be, under pain of amercement. *Manw. P.* I. *p.* 86.

* *Sint quieti, &c. de Chevagio, Hondepenny, Buckſtol, &* Triſtis, *& de omnibus miſericordiis, &c.*—Privileg. de Semplingham.

TRISYLLABLE, or TRISSYLLABLE, in grammar, a word conſiſting but of three ſyllables. See WORD, and SYLLABLE.

TRITE, ΤΡΙΤΗ, in muſic, the third muſical chord, in the ſyſtem of the ancients. See CHORD.

There are three ſtrings under this denomination in the ancient diagramma; *viz. trite hyperboleon*, *trite diazeugmenon*, and *trite ſynemmenon.* See DIAGRAM.

TRITHEISM, the opinion of the *tritheiſts*; or the hereſy of believing three Gods. See GOD, and TRINITY.

Tritheiſm conſiſts in admitting not only of three perſons in the Godhead; but of three ſubſtances, three eſſences or hypoſtaſes, and three Gods. See PERSON, HYPOSTASIS, *&c.*

Several people, out of fear of giving into *tritheiſm*, have become ſabellians; and ſeveral others, to avoid ſabellianiſm, have commenced *tritheiſts*; ſo delicate and ſubtile is the medium. See SABELLIAN.

In the famous controverſy between Dr. South and Dr. Sherlock, the firſt is judged to have run into ſabellianiſm, by a too rigorous aſſerting the unity of a Godhead; and the latter into *tritheiſm*, by a too abſolute maintaining the trinity.

John the grammarian, ſurnamed Philoponus, lover of labour, is held the author of the ſect of the *tritheiſts*, under the emperor Phocas; at leaſt it appears, he was a zealous advocate thereof.—Leontius and Georgius Piſides wrote againſt him.

TRITON, in poetry, a ſea demi-god, held by the ancients to be an officer or trumpeter of Neptune, attending on him, and carrying his orders and commands from ſea to ſea. See GOD.

The poets and painters repreſent him as half man, half fiſh, terminating in a dolphin's tail, and bearing in one hand a ſea-ſhell, which ſerved as a trumpet.

Some of the ancients make him the ſon of Neptune, and the nymph Salacia; Heſiod, of Neptune and Amphitrite; Neumenius in his book *de piſcationibus*, makes him the ſon of Oceanus and Tethys; and Lycophron, the ſon of Nereus.

But though Heſiod, and the mythologiſts, only ſpeak of one *triton*, the poets have imagined ſeveral; giving ſome of them for trumpeters to all the ſea-gods, particularly to Neptune and Venus: accordingly they were frequently introduced on the ancient theaters, and in the naumachia.

In effect, the *tritons* not only officiated as trumpeters in Neptune's retinue; but were alſo ſuppoſed to draw his chariot, *i. e.* the ſea-ſhell wherein he rode over the waters: as we find in Virgil, *Æneid* X. 209. Ovid. *Metam.* I. 333. and on a medal of Claudius.

The fable of the *tritons*, no doubt, took its riſe from ſea or mer-men; for that there are ſuch things as ſea-men, would ſeem a thing ſcarce to be doubted, after what we have ſaid under the article MER-MAID.

The poets ordinarily attribute to *triton* the office of calming the waves, and of making tempeſts ceaſe.—Thus in the 1ſt of the *metamorphoſes* we read, that Neptune deſiring to recal the waters of the deluge, commanded *Triton* to ſound his trumpet, at the noiſe whereof the waters all retired.

TRITONE, TRITONO, in muſic, a falſe concord, conſiſting of three tones, or a greater third, and a greater tone. See THIRD, and CONCORD.

Its ratio, or proportion in numbers, is, of 45 to 32. In dividing the octave, we find, on one ſide, the falſe fifth, and the *tritone* on the other. See OCTAVE.

The *tritone* is a kind of redundant fourth, conſiſting of three tones, whence its name; or, more properly, of two tones, with a greater ſemitone, and a leſſer, as of *ut* to *fa*, ſharp; of *fa* to *ſi*, flat, *&c.*—But it is not, as many imagine, a greater fourth; for the fourth is a perfect interval, which does not admit of any majority or minority: nor muſt the *tritone* be confounded with the falſe fifth; for the *tritone* only comprehends four degrees, *viz. ut*, *re*, *mi*, *fa*, ſharp; whereas the falſe fifth comprehends five, *viz. fa*, ſharp, *ſol*, *la*, *ſi*, *ut*: beſides, that among the ſix ſemitones, which compoſe the *tritone* chromatically, there are three greater and three leſſer; whereas among the ſix ſemitones, which compoſe the falſe fifth, there are only two leſſer, and four greater. See FOURTH, FIFTH, *&c.*

TRITURATION,* TRITURA, or TRITUS, in pharmacy, *grinding*; the act of reducing a ſolid body into a ſubtile powder, called alſo *levigation*, *pulveriſation*, &c. See POWDER, GRINDING, LEVIGATION, *&c.*

> * The word is formed from the Latin, *triturare, to thraſh*; of *tero, I wear, rub, grind.*

The *trituration* of woods, barks, minerals, and other hard and dry bodies, is performed in metalline mortars.

The ſame term is alſo applied to the comminuting, bruiſing, and dividing of humid matters into little parts.—The *trituration* of moiſt bodies is performed in marble, or ſtone mortars, with peſtles of wood, glaſs, ivory, *&c.*

Trituration, Boerhaave obſerves, has a wonderful force to diſſolve ſome bodies, and will render them as fluid, as if they were fuſed by the fire.—Thus, if you grind the powder of myrrh, and ſalt of tartar together, they will diſſolve each other. By rubbing new and bright filings of iron in a mortar, with double their weight of clean ſulphur, the iron will be diſſolved, ſo as by diluting it with water to afford the vitriolum martis. See IRON, and VITRIOL.

Gold long ground in a mortar, with ſalt of tartar, will yield a kind of tincture; and rubbed with mercury, in a mortar of glaſs, it intirely diſſolves into a purple liquor, and becomes a moſt powerful medicine.

Dr. Langelotte has wrote a curious treatiſe of the great effects of *trituration* in chymiſtry; and deſcribes a peculiar way he employed to grind gold, whereby he could render it as fluid as the fire does, and make an aurum potabile, by the bare motion of a mill. See GOLD, and AURUM.

That author, in the *Philoſophical Tranſactions*, mentions his way of grinding gold, and deſcribes two engines, or philoſophical mills for the purpoſe, with one of which, in the ſpace of fourteen natural days, he reduced a leaf of gold to a duſky powder, and putting it into a ſhallow retort placed in a ſand-heat, he thence obtained, by gradually increaſing the fire, and giving a ſtrong one at laſt, a few very red drops, which, digeſted *per ſe*, or with tartarized ſpirit of wine, afforded a pure and genuine aurum potabile.

The ſucceſs of this operation, the doctor attributes, in a great meaſure, to the ſalt of the air, which, in grinding, plentifully mixes and unites itſelf with the gold.

TRITURATION is alſo uſed in medicine, for the action of the ſtomach, on the food, whereby it is fitted for nutriment. See STOMACH, *&c.*

Some phyſicians maintain that digeſtion is performed by *trituration*, and not by fermentation; or that all the ſtomach does, is to grind and comminute the food into ſmaller parts to fit it for nutrition, without any other alteration therein.—See the article DIGESTION, where the doctrine is laid down at large.

This ſyſtem was much talked of ſome years ago, being countenanced by Dr. Pitcairn, and others; but ſeems now much declined.—The doctrine of *trituration* is not new: Eraſiſtratus maintained it in all its latitude many ages ago; and the moderns have only revived it.

It was firſt broached in the time of Hippocrates, that is, in a time when anatomy was but little known: and it was this that rendered it current.—An opinion was entertained by ſome phyſicians of thoſe times, that the ſtomach was only the receptacle of the ſolid or dry foods; that thoſe foods, after having been diluted, and broke in the mouth, were again broke more perfectly in the ſtomach, and by this means alone were converted into a chyle: but that the drink, by reaſon of its liquidity, not being ſubject to be broken, went to the lungs, and not the ſtomach, where, by reaſon of its abundance, it would rather have prejudiced the digeſtion than have aided it. Hippocrates, we read, in the fourth book of *diſeaſes*, ſtood up ſtrenuouſly againſt an opinion ſo viſibly contrary to reaſon and experience; and he informs us, that if he gave himſelf this trouble, it was becauſe the error had already got a good number of partiſans.—It could not ſtand long againſt the reaſons of Hippocrates; and its defeat was followed by the intire ruin of the ſyſtem of *trituration*, which had its foundation thereon. But Eraſiſtratus retrieved it again; and the doctrine, after having been ſupported for ſome time, fell anew into oblivion; whence ſome late authors have in vain endeavoured to recover it.

TRIUMPH, TRIUMPHUS, a ceremony, or ſolemnity, practiſed among the ancient Romans, to do honour to a victorious general, by affording him a magnificent entry into their city.

The *triumph* was the moſt pompous ſpectacle known among the ancients: authors uſually attribute its invention to Bacchus; and tell us, that he firſt *triumphed* upon the conqueſt of the Indians; and yet this ceremony was only in uſe among the Romans.

The *triumph* was of two kinds, the *leſſer*, and the *greater*.—The *leſſer triumph* was granted upon a victory over ſome unequal or unworthy enemy; as over pyrates, ſlaves, *&c.*—This was called *ovatio*; becauſe the only ſacrifices offered herein were ſheep. See OVATIO.

The *greater triumph*, called alſo *curulis*, and ſimply, the *triumph*, was decreed by the ſenate to a general, upon the conquering of a province, or gaining a ſignal battle.

The order and œconomy of the *triumph* was thus.—The general having diſpatched couriers with tidings of his ſucceſs, the ſenate met in Bellona's temple to read the letters:—this done, they ſent him the title *imperator*, with orders for him to return, and to bring his victorious troops along with him. When he was arrived near the city, the general and principal officers took oath of the truth of the victory; and the day of *triumph* was appointed.

The day being arrived, the ſenate went to meet the conqueror without the gate called *capena*, or *triumphalis*, and marched in order before him to the capitol.—He was richly clad in a purple robe embroidered with figures of gold, ſetting forth his glorious achievements: his buſkins were beſet with pearl, and he wore a crown, which at firſt was only laurel, but afterwards gold: one hand bore a laurel branch, and the other a truncheon. He was drawn in a car or chariot, adorned with ivory and plates of gold, drawn uſually by two white horſes, though ſometimes by other animals; as that of Pompey, when he *triumphed* over Africa, by elephants: that of Mark Anthony, by lions; that of Heliogabalus, by tygers; that of Aurelian, by deer; that of Nero, by hermaphrodite mares, *&c.*

At his feet were his children, or, ſometimes, on the chariot horſes.—It is added, that the public executioner was behind him, to remind him, from time to time, that theſe honours were tranſitory, and would not ſcreen him from the ſeverity of the laws, if he ſhould ever be found delinquent.

The cavalcade was led up by the muſicians, who had crowns on their heads: after them came ſeveral chariots, wherein were plans of the cities and countries ſubdued, done in relievo: they were followed by the ſpoils taken from the enemy, their horſes, arms, gold, ſilver, machines, tents, *&c.* After theſe came the kings, princes or generals ſubdued, loaden with chains, and followed by mimicks and buffoons, who inſulted over their miſfortunes.—Next came the officers of the conquering troops, with crowns on their heads.

Then appeared the *triumphal* chariot; before which, as it paſſed, they all along ſtrewed flowers; the muſic played in praiſe of the conqueror amidſt the loud acclamations of the people, crying, *io triumphe*. See ACCLAMATION.

The chariot was followed by the ſenate clad in white robes, and the ſenate by ſuch citizens as had been ſet at liberty or ranſomed.

The proceſſion was cloſed by the prieſts, and their officers and utenſils, with a white ox led along for the chief victim.

In this order they proceeded through the *triumphal* gate, along the via ſacra to the capitol, where the victims were ſlain.

In the mean time, all the temples were open; and all the altars loaden with offerings and incenſe: games and combats were celebrated in the public places, and rejoicings appeared every where.

What was horrible amidſt all this mirth, was, that the captives, when arrived at the forum, were led back to priſon and ſtrangled; it being a point of religion with them, not to touch the victims till they had taken full revenge of their enemies.—The rites and ſacrifices over, the *triumpher* treated the people in the capitol, under the portico's, and ſometimes in Hercules's temple.

TRIUMPHAL *arch*, } See the articles { ARCH.
TRIUMPHAL *column*, } { COLUMN.

TRIUMPHAL *crown* or *garland*. See CROWN.—It is ſaid to have been taken from Apollo's crowning his head with a laurel after killing the Delphian ſerpent.

TRIUMPHAL *gown*, *toga triumphalis*. See the article TOGA.

TRIUMPHANT *Church*. See the article CHURCH.

TRIUMVIR, one of three perſons who govern abſolutely and with equal authority in a ſtate.

The word is little uſed but in the Roman hiſtory.—Cæſar, Craſſus and Pompey were the firſt *triumvirs*, *i. e.* the firſt who divided the government of the republic among them. See TRIUMVIRATE.

There were alſo other officers, called *triumvirs*, *triumviri*; as the *triumviri capitales*, created in the year of Rome 463, to take care of priſoners, and look to the execution of criminals.

Triumviri monetales, who were magiſtrates created at the ſame time, to look to the coinage of the money; whence that mark ſtill extant on many ancient coins, IIIVIRI.—Theſe officers were very conſiderable, and choſen out of the knights.—They made part of the *centumviri*. The title they bear on medals is, IIIVIR AAA FF. *triumvir auro, argento, ære flando, feriendo*, which ſignifies that they had the direction of the caſting and ſtriking of gold, ſilver, and braſs.

There were alſo—*triumviri ædibus reficiendis*, officers appointed to look to the reparation of temples:—*triumviri coloniis deducendis*, for the conducting and ſettling of colonies:—*triumviri*, for the raiſing of troops:—*nocturnal triumviri*, to prevent or extinguiſh fires:—*triumviri*, to review the forces, &c.

In the Acilian family, we read of one M. Acilius IIIVIR VALETU. that is, *triumvir of health*, or a magiſtrate of health.—M. Spanheim takes him to have been a magiſtrate eſtabliſhed to perform ſacrifice to the gods of health, to dedicate their temples, &c.

Onuphrius and Vaillant read *triumvir valetudinis*; Patin, *triumvir valetudinarius*; but M. Spanheim, with much more reaſon, reads *triumvir valetudo*; in like manner, as on a medal of the Aquilian family, we read IIIVIR VIRTUS, ſignifying, that one M. Aquilius had been made *triumvir*, to repair the temple of virtue, and Acilius that of health.

TRIUMVIRATE, TRIUMVIRATUS, an abſolute government adminiſtered by three perſons, with equal authority. See TRIUMVIR.

There were two famous *triumvirates* at Rome.—Pompey, Cæſar and Craſſus eſtabliſhed the firſt; and Auguſtus, Mark Anthony, and Lepidus, the ſecond.

This latter *triumvirate* gave the laſt blow to the liberty of the republic. Auguſtus having vanquiſhed Lepidus and Anthony, the *triumvirate* ſunk into a monarchy. See MONARCHY.

TRIUNE, *tres in uno*, three in one; a term ſometimes applied to God, to expreſs the unity of the God-head in a trinity of perſons. See TRINITY.

TROCHAIC, TROCHAICUS, in the Latin poetry, a kind of verſe conſiſting of trochees; or wherein that foot predominates; as the iambus does in the iambic. See IAMBIC, and TROCHEE.

The 18th ode of the 2d book of Horace's odes, conſiſts of ſtrophes of two verſes, the firſt whereof is *trochaic* diameter catalectic; *i. e. trochaic*, compoſed of three trochees, and a ſyllable at the end: which ſome call the *Euripedean trochaic*.

Non ebur neque aureum——
Largiora flagito.

TROCHANTER, ΤΡΟΧΑΝΤΗΡ, in anatomy, a name given to two apophyſes ſituate in the upper part of the thigh-bone. See APOPHYSIS.

The largeſt, which is above, is called the *great trochanter*; and the ſmaller, beneath, the *leſs trochanter*.—See *Tab. Anat.* (Oſteol.) *fig.* 7. *n.* 23. 23. *fig.* 3. *lit. t.* and *lit. u. fig.* 7. *n.* 24. See alſo the article FEMUR.

The word literally ſignifies *rotator*, or *roller*; formed from the Greek, τροχαω, *roto, I run, I turn round*.—That appellation was given them by reaſon they receive the tendons of moſt of the muſcles of the thigh, among which are the obturators, which move it round. See OBTURATOR.

TROCHE, TROCHISCUS, in pharmacy, a form of medicine, made to be held in the mouth to diſſolve gradually.

The *troche* is properly a dry compoſition, the chief ingredients whereof, after having been brought into a very fine powder, are incorporated with ſome proper liquor, as diſtilled waters, wine, vinegar, or mucilages; and reduced into a maſs, which is moulded into little cakes, or balls of any form, at pleaſure, and dried in the air, far from the fire.

There are *troches* of various kinds, and for various intentions; as, *purgative*, *alterative*, *aperitive*, *corroborative*, &c. *troches*. Latin authors call them *paſtilli*, *rotulæ*, *placentulæ*, *orbes*, and *orbiculi*; and the Engliſh, frequently, *lozenges*. See LOZENGE, PASTIL, &c.

The chief *troches* are thoſe of agaric, liquorice, nutmeg, amber, rhubarb, capers, myrrh, roſes, camphor, ſquillæ, vipers, &c.—Thoſe of coloquintida, are called *troches of alhandal*, from the Arabs, who called coloquintida *handal*.

TROCHEE, TROCHÆUS, in the Greek and Latin poetry, a kind of foot, conſiſting of two ſyllables, the firſt long, the latter ſhort:—ſuch are the words *vādĕ* and *mūſă*. See FOOT.

The *trochee* is the reverſe of the iambus, and has juſt a contrary effect; the latter being light and ſprightly, and the former weak and languid, as all thoſe meaſures are which move from a long to a ſhort ſyllable. See IAMBIC.

Some call the *trochee*, *choreus*, becauſe proper for ſongs and dances. Theſe give the denomination *trochæus* to the tubrachys. *Quint. l.* 10. *c.* 4.

TROCHILUS, in architecture, a hollow member, more uſually called by modern architects, *ſcotia*; and by our Engliſh workmen, *caſement*.—See *Tab. Archit. fig.* 4. See alſo the article SCOTIA.

TROCHITÆ, or TROCHITES, in natural hiſtory, a kind of figured foſſil ſtones, reſembling plants; vulgarly called *St. Cuttbert's beads*. See FOSSIL, and STONE.

They are uſually of an opake, dark colour, break like flint, gloſſy and ſhining, and are eaſily diſſolved in vinegar.——Their figure is generally cylindrical, ſometimes a little tapering, the circumference ſmooth, and both the flat ſides covered with fine radii drawn from a certain hole in the middle to the circumference.—See *Tab. Natural Hiſtory*, *fig.* 12. *n.* 1, 2, 3.

Two or three or more of theſe *trochitæ*, joined together, conſtitute what the naturaliſts call an *entrochos*.

The *trochitæ*, or ſingle joints, are ſo ſet together, that the rays of one enter into furrows in the other, as in the ſutures of the ſcull.—They are found in great plenty in the bodies of the rocks at Braughton and Stock, two villages in Craven, at all depths under ground; alſo in Mendip hills, &c. ſometimes only ſprinkled here and there, and ſometimes in large ſtrata or beds of all magnitudes, from the ſize of the ſmalleſt pin, to two inches about.

They are generally found ramous or branchy, larger branches ariſing from the ſtem, or cylinder, and ſmaller from theſe. The branches being deeply inſerted into the ſtem, the tearing them off leaves great holes therein.

Dr. Liſter has diſcovered a ſort of little fragments among them, which he takes to have been the apices of the plants; and another ſort, which he ſuppoſes to have been the roots.—In effect, the *trochitæ* are generally allowed to be the bodies of rock plants, ſuch as coral is.

Mr. Beaumont, in the *philoſophical tranſactions*, aſſures us, that he has found that all the cliffs in ſome mines are made up of theſe ſtone-plants, ſome whereof have been converted into limeſtone rocks, while in their tender growth; while others becoming ſpar, compoſe bodies of that ſubſtance: and conſidering that all the cliffs for a very large circumference in ſome places conſiſt wholly of theſe plants, we may ſay, there have been, and, in all probability, ſtill are, whole fields or foreſts of theſe under-ground, as there are of coral in the red ſea. See CORAL.

In the courſes between the cliffs, are found of theſe plants at all ſtages and degrees of maturity, growing up in the gritty clay, and rooted in the rake-mold ſtones, many of them of the form and dimenſions of a tobacco-pipe, ſome yet crude or raw clay, others of the conſiſtence of lime-ſtone, others ſtill harder, with the evident beginnings of circles and ſutures, and others full grown, and become perfect ſpar, which is their point of maturity. See SPAR.

The pith continues ſtill white and ſoft; as the whole plant, no doubt, was at firſt; and is continually refreſhed by the mineral ſteams and moiſture which have free acceſs to it through five hollow ſlits or feet in the figured roots, or through the maſs of clay uſually lying under the plain roots.

Nor can it be denied, but theſe ſtone-plants have true life and growth.—In the curioſity of their make, they may vie with moſt of the vegetable kingdom, and are ſhaped and formed like them, having ſtem, branches, roots, an inward pith, as likewiſe joints and runnings in their grit, and ſometimes cells to ſupply the place of veins and fibres; why, then, may not they be allowed as proper vegetations, as other plants?

Indeed, it is highly probable, theſe rock-plants are lapides ſui generis, and not parts of animals or plants petrified, as many authors have imagined.—If the figured roots, whereon they ſometimes grow, give any ſuſpicion they might have belonged to an animal, particularly a ſpecies of the ſtella arboreſcens; the trunks clearly evince the contrary, and can never be looked on as parts of an animal: nor are they reducible to any known ſpecies of vegetables. Mr. Beaumont tells us, that he has by him above 20 different ſpecies of *trochites*, all of them wonderfully regular, and not to be paralleled by any vegetable he knows of in nature: and it is inconceivable how ſo many ſpecies diffuſed through many parts of the earth, ſhould come to be loſt. See PLANT, PETRIFACTION, CORNU *Ammonis*, *&c.*

TROCHLEA, ΤΡΟΧΑΙΑ, one of the mechanical powers, uſually called a *pulley*. See PULLEY.

Hence, the cavity in the bone of the arm or ſhoulder, whereinto, when the arm is ſtretched forth, the proceſs of the undermoſt and leſſer of the long bones of the cubitus enters, is alſo called *trochlea*. See CUBITUS, *&c.*

TROCHLEARES, in anatomity, a name given to the oblique muſcles of the eye; becauſe ſerving to pull the eye obliquely upwards or downwards, as if it turned like a pulley. See OBLIQUUS, and EYE.

TROCHOID,* TROCHOÏS, or TROCHOIDES, in geometry, a curve, whoſe geneſis may be thus conceived.—If a wheel or circle be moved with a two-fold motion at the ſame time, the one in a right line, and the other circularly about its centre: and theſe two motions be equal, *i. e.* deſcribe two equal lines in the ſame time: and if in the radius, which at the beginning of the motion, reaches from the centre of the wheel, or the firſt point of the line which deſcribes the circumference; if, I ſay, in this radius a point be taken any where except in the centre, this point will deſcribe a curve, one part whereof will be below the line deſcribed by the centre, and the other above it.—This line, thus deſcribed by the point taken in the radius, is called the *trochoid*.

* The word is formed from the Greek, τροχος, *wheel*, and ειδος, *form*.

The right line which joins the two extremities of the *trochoid*, and which is either the path the wheel makes, or a line parallel to that path, is called the *baſis of the trochoid*.

The *axis of the trochoid* is the diameter of the wheel, perpendicular to the baſe in the middle of the motion; or that part of the radius between the *trochoid* and its baſe.—The point wherein the axis is cut into two parts by the line deſcribed by the centre of the wheel, is called *the centre of the trochoid*; the uppermoſt point of the axis, the *vertex of the trochoid*; and the plane, comprehended between the *trochoid* and its baſe, the *trochoidal ſpace*.

The *trochoid* is the ſame with what we otherwiſe call the *cycloid*; the properties, *&c.* whereof, ſee under the article CYCLOID.

TROGLODYTES,* TROGLODYTÆ, in the ancient geography, a people of Æthiopia, ſaid to have lived in caves under-ground.

* The word is formed of the Greek, τρωγλη, *caverna*, and δυω, *ſubeo*, *I enter*.

Pomp. Mela gives a ſtrange account of the *Troglodytes*.—He ſays, they did not ſo properly ſpeak as ſhriek; that they lived on ſerpents, *&c.*—Tzetzes calls them *ichthyophagi*. Montanus takes them to be the ſame with thoſe called in ſcripture *Ghanamim*. Pintianus in Strabo will have the name wrote without the *l*, *Trogoditæ*.

TROGLODYTES is alſo an appellation given to a ſect of Jewiſh idolaters. See SECT.

The prophet Ezekiel relates, chap. viii. ver. 8, 9, 10, *&c.* that God, among other abominations of the Iſraelites which he ſet before him, ſhewed him ſeventy old men, who with their cenſers in their hands, adored ſecretly all kinds of animals and reptiles painted on the wall.

Philaſtrius, on this viſion of the prophet, erects theſe idolaters into a ſect of Iſraelites, who, hiding themſelves under-ground and in caves, adored all kinds of idols: and the editor of Philaſtrius calls this ſect *Troglodytes*, from τρωγλη, *a cave*, and δυω, *I penetrate*, as believing, on the credit of Philaſtrius, that thoſe of this ſect hid themſelves in caves.

And yet the prophet plainly ſhews, that it was in ſecret parts of their houſes, and not in ſubterraneous caverns, that theſe 70 Iſraelites idolatrized.—The name *Troglodytes*, then, is feigned; ſo is the ſect.

TROIA, or TROJAN *games*, *ludi* TROJANI, were games inſtituted by Aſcanius, ſon of Æneas; and which afterwards paſſed to the Romans, and were celebrated in the circus by the youth of Rome. See GAMES, and CIRCUS.

One of the number who preſided over the ſolemnity, was called *princeps juventutis*; and was always of one of the firſt families in Rome. See PRINCE.

At firſt, it is ſuppoſed, they only engaged on foot, and on horſeback; becauſe Virgil, who deſcribes theſe games in the Æneid. *lib.* 5. only ſpeaks of horſes and cavaliers, without any mention of bigæ and quadrigæ, which were not in uſe at Rome, till long after Aſcanius.—And yet Dion, ſpeaking of Cæſar's games, ſays, the youth there combated in chariots: but it is thought by ſome, that theſe were not the *Trojan* games, but races and combats of a different kind, proper for young people, of a more advanced age.

TROLLING, among Anglers.—To *troll*, is to fiſh for pikes with a rod, whoſe line runs on a reel. See *Pike*-FISHING.

TRONAGE,* TRONAGIUM, an ancient cuſtom or toll paid for the weighing of wool.

* The word comes from *trona*, an old name for a beam to weigh withal. Hence,

TRONATOR, an officer of the city of London, whoſe buſineſs it was to weigh the wool brought into that city. See WEIGHER.

TRONCONNEE, or TRONCNNE', in heraldry, denotes a croſs or other things cut in pieces and diſmembered; yet ſo as all the pieces keep up the form of a croſs, though ſet at a ſmall diſtance from one another. See CROSS.

TRONE *weight*, was the ſame with what we now call *troy-weight*. See WEIGHT.

TROOP, a ſmall body of horſe, or dragoons, uſually about 50; commanded by a captain: anſwering to a company of foot. See COMPANY, CAPTAIN, SQUADRON, *&c.*

Independent TROOP, is a *troop* that is not imbodied with, or joined with any regiment. See REGIMENT, GUARD, *&c.*

To beat the TROOP, is the ſame with beating the aſſembly. See ASSEMBLY.

TROOPS *of the houſhold*. See the article HOUSHOLD.

TROPE, TROPUS, in rhetoric, a word or expreſſion uſed in a different ſenſe from what it properly ſignifies.—Or, a word changed from its proper and natural ſignification to another, with ſome advantage. See FIGURE.

As, when we ſay an *aſs*, for a *ſtupid perſon*; *thunderbolt of war*, for a *great captain*; to *waſh the black-moor white*, for a *fruitleſs undertaking*.

This change of ſenſe is never to be uſed, but where it gives a force and dignity, or renders the diſcourſe more ſignificant, weighty and graceful.

It is called *trope*, τροπος, from the Greek, τρεπω, *verto*, *I turn*, *change*, in regard the words are here transferred from the things they properly import, to others which they only import indirectly; and that *tropes* only ſignify the things they are applied to, by reaſon of the connexion and relation thoſe things have with thoſe others, whoſe proper names they are.

This change or inverſion is performed various ways; but chiefly four; whence ariſe four principal *tropes*, *viz.* the metaphora, metonymia, ſynecdoche and ironia; each whereof, ſee under its proper article, METAPHORA, METONYMIA, SYNECDOCHE, *&c.*

Some authors confound *trope*, with figure; but they are very different things.—Moſt authors, as F. de Colonia, *&c.* make figure, the genus, and *trope*, a ſpecies; defining figure to be any ornament in diſcourſe, whereby it is raiſed above the common language; and *trope* to be that peculiar kind of ornament which conſiſts in a change of the ſenſe, *&c.*

But Voſſius makes *trope* and figure to be two collateral and independent things; defining *trope* to be the change of the ſenſe, *&c.* and figure, to be any ornament, except what becomes ſo by ſuch change, *&c.* See FIGURE.

'Tis in the *tropes*, principally, that the richneſs and variety of language conſiſts; and yet thoſe ſhould never be uſed but to expreſs what could only be repreſented imperfectly, in common and proper terms.—*Tropes* ſhould always be clear; they are vicious, if they be obſcure, or too far fetched. The idea of the *trope* ſhould be connected with that of the proper name, that they ſhould follow each other; ſo that in exciting the one, the other ſhould be awakened of courſe.

Beſides the four capital *tropes* above-mentioned, there are ſeveral inferior ones.—When the *trope* is too bold, it is called an *hyperbole*; when continued, it is called an *allegory*; when too obſcure, an *ænigma*; when it ſhocks us, or is too remote, a *catachreſis*. See HYPERBOLE, ALLEGORY, ÆNIGMA, *&c.*

Add to theſe, other *tropes*, as the metalepſis, antonomaſia and litotes, or extenuation. See METALEPSIS, *&c.*

Some alſo refer the ſix kinds of ſcoffing or deriſion to the *tropes*; *viz.* the ſarcaſm, diaſyrm, charientiſm, aſteiſm, mycteriſm and mimeſis; but without ſufficient reaſon. See SARCASM, IRONY, *&c.*

TROPHY,* TROPÆUM, among the ancients, a pile or heap of arms of a vanquiſhed enemy, raiſed by the conqueror in the moſt eminent part of the field of battle.

* The word is formed from the Latin, *trophæum*, or *tropæum*, which Voſſius deduces from the Greek, τροπη, *the flight of an enemy*.

The word is alſo uſed for an artificial repreſentation of ſuch a pile in marble, ſtone, or other matter.—Such were the *trophies* of Marius, and Sylla in the capitol, *&c.*

The ancient *trophies* conſiſt of Greek and Roman arms; and the modern ones of arms of the various nations now in uſe; as in thoſe inſulated ones near Blenheim, in the Fauxbourg S. Antoine, and in the caſtle of Verſailles.—Some are done in baſſo-relievo, as thoſe of the Trajan column, and the attic of the court of the Louvre.

Trophies are likewiſe frequently exhibited on medals of the emperors, ſtruck on occaſion of victories; wherein, beſides arms and ſpoils, are frequently ſeen, one or two captives by the ſides of the *trophy*.

Trophies, M. Vaillant obſerves, were, originally, nothing but trunks of trees, which the victor planted on the moſt eminent part of the conquered province, and hung them with the ſpoils of the enemy, to perpetuate the memory of his defeat.

TROPHY *money*, a duty paid annually by the houſekeepers in the ſeveral counties of England towards providing harneſs, drums, colours, *&c.* for the militia. See MILITIA.

TROPICAL *Year*. See YEAR, and SOLAR.

TROPICS, TROPICI, in aſtronomy, two immoveable circles of the ſphere, drawn through the ſolſtitial points, parallel to the equator. See CIRCLE, and SPHERE.

Such as the circles ME and NL, *Tab. Aſtronomy*, *fig.* 52. See SOLSTITIAL *point*.

The *tropics* may be defined, two circles parallel to the equator, at ſuch diſtance therefrom, as is equal to the ſun's greateſt receſs from the equator towards the poles; or to the ſun's greateſt declination; or the obliquity of the ecliptic. See DECLINATION, OBLIQUITY, &c.

Of the two *tropics*, that drawn through the beginning of cancer E, is called the *tropic of cancer*. See CANCER.

And that through the beginning of capricorn, the *tropic of capricorn*. See CAPRICORN.

They have their name from the Greek, τροπη, *turn, converſion*, as being the limits of the ſun's way, or declination towards north and ſouth; ſo that when the ſun is arrived at either of them, he turns the other way.

Hence, 1. Since the declination of the ecliptic is the arch EA or LD; EN will be the diſtance of the *tropics*; which is double the greateſt declination.

2. Wherefore if the ſun's meridian altitude be obſerved, both in the winter and ſummer ſolſtice, and the latter be ſubtracted from the former, the remainder will be the diſtance of the *tropics*; half whereof is the greateſt declination of the ecliptic. See ECLIPTIC, SOLSTICE, &c.

TROPICS, in geography, are two leſſer circles of the globe, drawn parallel to the equator, through the beginnings of cancer and capricorn. See CANCER, and CAPRICORN.

Theſe *tropics* are in the planes of the cœleſtial *tropics*, and at the diſtance of 23° 29′ from the equator, which is the ſun's greateſt declination. See CIRCLE, and GLOBE.

TROPISTS, or TROPICI, the name of a ſect.—St. Athanaſius, in his letter to Serapion, gives this appellation to the Macedonians, who were alſo called *pneumatomachi* in the eaſt, and *patripaſſians* in the weſt. See PNEUMATOMACHI, &c.

The reaſon of the name *tropiſt* was, that they explained the ſcripture altogether by tropes and figures of ſpeech. See TROPE, ALLEGORY, MYSTICAL, &c.

The Romaniſts alſo give the appellation *tropiſts* to thoſe of the reformed religion; in regard of their conſtruing the words of the euchariſt figuratively. See TRANSUBSTANTIATION.

TROPITES, TROPITÆ, a ſect, who, according to Philaſtrius, maintained that the Word was turned or converted into fleſh, or into man. See INCARNATION.

This opinion they founded on that paſſage of St. John, miſunderſtood; *the Word was made fleſh*; as if it imported, that the Word was converted into fleſh, and not that he was cloathed with our fleſh, and our nature.

TROT, in the manage, one of the natural paces of a horſe, performed with two legs in the air, and two on the ground at the ſame time, croſs-wiſe, like St. Andrew's croſs; and continuing ſo alternately to raiſe the hind leg of one ſide, and the fore leg of the other ſide at once, leaving the other hind and fore leg upon the ground till the former come down.

In this motion, the nearer the horſe takes his limbs from the ground, the opener, the evener, and the ſhorter his *trot* will be.—If he takes up his feet ſlovenly, it is a ſign of ſtumbling and lameneſs; if he tread narrow, or croſs, it betokens interfering or failing; if he tread long, it ſhews over-reaching; if he ſteps uneven, it beſpeaks toil and wearineſs.

TROUBADOURS, a name anciently, and to this day, given the ancient poets of Provence. See POETRY.

Some will have the word borrowed from *trouver, to find*, by reaſon of their inventions; though others take them to have been called *trombadours*, by reaſon they ſung their poems on an inſtrument called a *trompe* or *trump*.

The poeſy of the *troubadours* conſiſted in ſonnets, paſtorals, ſongs, ſyrventes or ſatyrs, which were much to their taſte; and in tenſons, which were love diſputes.

Jean de notre Dame, commonly called Noſtradamus, a procureur in the parliament of Provence, wrote an ample diſcourſe of theſe poets.—He makes the number ſeventy-ſix.

Paſquier tells us, he had an extract of an ancient book belonging to cardinal Bembo, intitled, *Los noms daquels qui firent tenſons & ſyrventes*, which made their number ninety-ſix, among which was an emperor, *viz.* Frederic I. and two kings, *viz.* Richard I. of England, and a king of Arragon, with a dauphin, ſeveral counts, &c. Not that all theſe had compoſed intire works in provincial; ſome of them had not brought forth any thing beyond epigrams.

Petrarch ſpeaks with applauſe of ſeveral *troubadours* in the IVth chapter of the triumph of love.—The Italian poets are ſaid to have borrowed their beſt pieces from the *troubadours*. Paſquier declares expreſly, that Dante and Petrarch are, indeed, the fountains of Italian poetry; but fountains which have their ſources in the provincial poetry.

Bouche, in his hiſtory of Provence, relates, that about the middle of the XIIth century, the *troubadours* began to be eſteemed throughout Europe, and that their credit and poeſy was at the higheſt about the middle of the XIVth. He adds, that it was in Provence that Petrarch learned the art of rhyming, which he afterwards practiſed, and taught in Italy.

TROVE, in law. See TREASURE *trove*.

TROVER, in law, an action which a man hath againſt one that, having found any of his goods, refuſeth to deliver them upon demand.

Actions of detinue are frequently turned into actions upon the caſe *ſur trover* and converſion. See DETINUE, and DEPOSITE.

TROUGH *of the ſea*, is the hollow or cavity made between two waves or billows in a rowling ſea.

Hence, when a ſhip lies down there, they ſay ſhe lies in the *trough of the ſea*.

TROUSSEQUIN, in the manage, a piece of wood cut arch-wiſe, raiſed above the hinder bow of a great ſaddle, and ſerving to keep the bolſters firm.

TROUT *coloured*.—A horſe is ſaid to be of this colour when he is white, and ſpeckled with ſpots of black, bay, or ſorrel, eſpecially about the head and neck.

TROUT-*fiſhing*. See *Trout*-FISHING.

TROY-*weight*, anciently called *trone-weight*. See TRONAGE, and WEIGHT.

TROY-*pound*. See the article POUND.

TRUCE,* TREUGA, a ſuſpenſion of arms; or a ceſſation of hoſtilities between two parties at war. See SUSPENSION, and ARMISTICE.

* The word, according to Menage, &c. comes from the Latin, *treuga*, which ſignifies the ſame; and which Caſeneve derives further from the German, *traue* or *treue*, which ſignifies *truſt*.

Truces are frequently concluded between princes, in order to come to a peace.—*Truces* of many years ſerve in lieu of treaties of peace between princes, whoſe differences cannot be finally adjuſted. See TREATY.

TRUCE *of God*, *Treuga Dei*, is a phraſe famous in the hiſtories of the XIth century, when the diſorders and licences of private wars between particular lords and families, obliged the biſhops of France to forbid ſuch violences within certain times, under canonical pains.

Thoſe intervals they called *treuga Dei*, *treve de Dieu*, q. d. *truce of God*, a phraſe frequent in the councils ſince that time.

The firſt regulation of this kind was in a ſynod held in the dioceſe of Elno in Rouſſillon, *anno* 1027, where it was enacted, that throughout that county, no perſon ſhould attack his enemy from the hour of nones on Saturday, to that of prime on Monday, that Sunday might have its proper honour: that no body ſhould attack, at any time, a religious prieſt walking unarmed, nor any perſon going to church, or returning from the ſame, or walking with women: that no body ſhould attack a church, or any houſe within thirty paces around it.—The whole under penalty of excommunication, which, at the end of three months, was converted into an anathema.

TRUCHMAN, *Dragoman*, or *Drogman*, in the countries of the Levant, an interpreter. See DRAGOMAN.

TRUCK, in a ſhip, a ſquare piece of wood at the top of a maſt, to put the flag-ſtaff in.—See *Tab. Ship. fig.* 1. *n.* 34, 79, 96, 121, 145. *lit. q.*

TRUCKING, in commerce. See PERMUTATION, EXCHANGE, COMMERCE, &c.

TRUCKS, among gunners, round pieces of wood in form of wheels, fixed on the axel-trees of carriages; to move the ordnance at ſea, and ſometimes alſo at land. See CARRIAGE.

TRUE, ſomething agreeable to the reality of things, or to truth. See TRUTH.

In this ſenſe we ſay, the *true* God, the *true* religion, *true* gold, &c.--in oppoſition to falſe, or pretended ones. See FALSEHOOD.

TRUE *place* of a planet, or ſtar, in aſtronomy, is a point of the heavens ſhewn or pointed out by a right line drawn from the centre of the earth through the centre of the planet or ſtar. See PLACE. See alſo PLANET, &c.

In this ſenſe the word ſtands oppoſed to *apparent* place, which is that found by a right line drawn from the obſerver's eye through the centre of the planet or ſtar. See APPARENT.

This point in the heavens is referred to the ecliptic or zodiac, by the planets or ſtars circle of longitude. See CIRCLE *of Longitude*.

TRUE *altitude*,	See the articles	ALTITUDE.
TRUE *anomaly*,		ANOMALY.
TRUE *horizon*,		HORIZON.
TRUE *aſthma*,		ASTHMA.
TRUE *propoſition*,		PROPOSITION.
TRUE *recovery*,		RECOVERY.
TRUE *ribs*,		RIBS.
TRUE *ſuture*,		SUTURE.

TRUFFLES,* *Tubera terræ*, in natural hiſtory, a kind of ſubterraneous vegetable production, not unlike muſhrooms. See MUSHROOM.

* The word is formed from the French, *truffe* or *truffle*; of the Latin, *tuber* or *tuberculum*.

The ancient phyſicians, and naturaliſts, rank *truffles* in the number of roots, bulbs, or cloves; and define them to be a ſpecies of vegetables, without ſtalks, leaves, fibres, &c. Bradley calls them *under-ground edible muſhrooms*, or *Spaniſh trubbes*, and *under-ground deer's balls* or *muſhrooms*.

They are produced moſt in dry chapped grounds, and that, as Pliny ſays, chiefly after rains and thunder, in autumn.—Their duration he limits to a year.—Their colour is uncertain; ſome being white, others black, &c.

In Italy, France, &c. they eat them as a great dainty, either fried in ſlices with oil, ſalt and pepper, or boiled over and again in their own broth.—The hogs are exceedingly fond of them, and are frequently the means of diſcovering the places where they are; whence the common people call them *ſwine-bread.*

The modern botaniſts rank *truffles* in the number of plants; though they want moſt of the uſual parts thereof.—All we know of their growth, is, that they are at firſt no bigger than a pea, reddiſh without, and within whitiſh; and that as they ripen, the white parts grow more duſky and black: only there are ſtill left a number of white ſtreaks, which all terminate at places where the outer coat is cracked, or open: and which, in all probability, are the veſſels that convey the nouriſhment into the *truffles.*

In theſe veſſels is found a whitiſh matter, which, when viewed with a microſcope, appears to be a tranſparent parenchyma, conſiſting of veſiculæ; in the middle whereof are perceived little round black grains, ſeparate from each other, ſuppoſed to be the ſeed of the *truffles.* See Seed.

When the *truffles* rot in the ground through exceſs of ripeneſs, theſe grains are the only thing that remain of them; and theſe are ſuppoſed to produce new *truffles,* which grow one after another.

What confirms the opinion of their coming from ſeed, is, that there have been *truffles* lately diſcovered in England, and this only in Northamptonſhire, and even only in one place thereof, *viz.* near Ruſhton, a place ſtocked with plants, formerly brought from Languedoc; and it is only ſince then, that any *truffles* have been there obſerved: whence it is concluded, that the ſeed of theſe *truffles* was brought from France among the roots of the other plants.

Theſe Engliſh *truffles* were firſt diſcovered by Dr. Hatton.—Dr. Tancred Robinſon aſſures us, they are the true French *truffles,* the Italian *tartuffi* or *tartuffole,* and the Spaniſh *turmas de tiera,* being not noted by Mr. Ray as ever known on Engliſh ground: indeed, he adds, that he has ſeen them thrice as large at Florence, Rome, &c.

Thoſe obſerved in England are all included in a ſtudded bark or coat, and the inner ſubſtance is of the conſiſtence of the fleſhy part of a young cheſnut, of a paſte colour, a rank or hircine ſmell, and unſavory.

By a chymical analyſis, *truffles* are found to abound in a volatile alkali ſalt mixed with oil, upon which their ſmell, &c. depends. They never riſe out of the ground, but are found uſually half a foot beneath the ſurface thereof.

Dr. Hatton has obſerved ſeveral little fibres iſſuing out of ſome *truffles,* and inſinuating themſelves within the ſoil, which, in all probability, do the office of roots.—The *truffles* grow tolerably globular, as receiving their nouriſhment all around them; they being to be conſidered like ſea plants encompaſſed with their food, which they ſuck in through the pores of their bark or rind. See Coral.

They are tendereſt and beſt in the ſpring, though eaſieſt found in autumn; the wet ſwelling them, and the thunder and lightening diſpoſing them to ſend forth their ſcent, ſo alluring to the ſwine: hence ſome of the ancients called them *ceraunia,* q. d. *thunder-ſtones.*

The depth at which the *truffles* lie, Dr. Robinſon obſerves, is no objection to their being of the vegetable tribe; that being a thing common to ſeveral other plants which ſhoot up ſtalks, particularly the lathyrus tuberoſus, commonly called *chamæbalanus* and *terræ glans,* in Engliſh *peaſe, earth-nuts,* the roots of our bulbocaſtanum, &c.

The ancients are exceedingly divided as to the uſe of *truffles;* ſome affirming them to be wholſome food, and others pernicious; Avicenna particularly, who will have them to cauſe apoplexies.—For my own part, ſays M. Lemery, I am of opinion they have both good and evil effects; they reſtore and ſtrengthen the ſtomach, promote the ſemen, &c. but when uſed too freely, they attenuate and divide the juices immoderately, and by ſome volatile and exalted principles, occaſion great fermentations, &c. though the pepper and ſalt they are ordinarily eaten withal, do doubtleſs contribute greatly to thoſe effects:—Their rich taſte is owing to their not putting forth any ſtalk; in effect, their principles being united, and, as it were, concentred in a little bulb, muſt yield a richer and more delicious ſavour than if the juices were diſperſed by vegetation through the ſeveral parts of a common plant.—Some roaſt the *truffles* under the aſhes; others pulverize and mix them in ſauces.

TRUG,* or **Trug-*corn*,** **Truga *frumenti*,** in our ancient cuſtoms, denotes a meaſure of wheat.

* *Tres* trug *frumenti vel avenæ faciunt 2 buſhels, inter præbendam de Hunderton in eccleſia* Heref. M. S. *de temp. E.* 3.

At Lempſter, the vicar has *trug-corn* allowed him for officiating at ſome chapels of eaſe, as Stoke and Dockly within that pariſh.

TRULLIZATION, in the ancient architecture, the art of laying on ſtrata or layers of mortar, gypſum, or the like, with the trowel, in the inſide of vaults, cielings, &c.

TRULLUM, a barbarous word, ſignifying *dome;* chiefly uſed in the phraſe, *council in trullo.* See Council.

This was a council aſſembled in the year 680, againſt the Monothelites, in the dome of the palace of Conſtantinople, called *trullum;* the name whereof it has retained. It was alſo called the *Quiniſextum.* See Quinisexta.

The *trullum* was properly a hall in the palace of the emperors of Conſtantinople, where they uſually conſulted of matters of ſtate.*—The council held therein was the 6th œcumenical or general council, called *in trullo.*

* The term is formed from the Latin, *trulla, cup;* the hall being ſo called becauſe vaulted.

TRUMPET,* a muſical inſtrument, the moſt noble of all portable ones of the wind kind, uſed chiefly in war, among the cavalry, to direct them in the ſervice. See Music.

* The word is formed from the French, *trompette.* Menage derives it from the Greek, ϛρομϐος, *turbo,* a ſhell anciently uſed for a *trumpet.* Du Cange derives it from the corrupt Latin, *trumpa,* or the Italian, *tromba,* or *trombetta;* others from the Celtic, *trompill,* which ſignifies the ſame.

It is uſually made of braſs, ſometimes of ſilver, iron, tin and wood. Moſes, we read, made two of ſilver, to be uſed by the prieſts, Numb. x. and Solomon made 200 like thoſe of Moſes, as we are informed by Joſephus, lib. viii. which ſhews abundantly the antiquity of that inſtrument.

The ancients had various inſtruments of the *trumpet* kind; as the tubæ, cornua, and litui. See Horn, &c.

The modern *trumpet* conſiſts of a mouth-piece, near an inch broad, though the bottom be only one third ſo much.—The pieces which convey the wind are called the *branches;* the two places where it is bent, *potences;* and the canal between the ſecond bend and the extremity, the *pavilion;* the places where the branches take aſunder, or are ſoldered, the *knots;* which are five in number, and cover the joints.

When the ſound of the *trumpet* is well managed, it is of a great compaſs.—Indeed its extent is not ſtrictly determinable; ſince it reaches as high as the ſtrength of the breath can force it.—A good breath will carry it beyond four octaves, which is the limit of the uſual keys of ſpinets and organs.

In war, there are eight principal manners of ſounding the *trumpet:* the firſt, called the *cavalquet,* uſed when an army approaches a city, or paſſes through it in a march.—The ſecond the *boute-ſelle,* uſed when the army is to decamp or march.—The third is when they ſound to horſe, and then to the ſtandard.—The fourth is the *charge.*—The fifth the *watch.*—The ſixth is called the *double cavalquet.*—The ſeventh the *chamade.*—And the eighth the *retreat.* Beſides various flouriſhes, voluntaries, &c. uſed in rejoicings.

There are alſo people who blow the *trumpet* ſo ſoftly, and draw ſo delicate a ſound from it, that it is not only uſed in church muſic, but even in chamber muſic: and it is on this account that in the Italian and German muſic we frequently find parts intitled, *tromba prima,* or I^{a}, firſt *trumpet, tromba* II^{a}, *ſegonda,* III^{a}, *terza,* ſecond, third *trumpet,* &c. as being intended to be played with *trumpets.*

There are two notable defects in the *trumpet,* obſerved by Mr. Roberts in the *philoſophical tranſactions;*—The firſt is, that it will only perform certain notes within its compaſs, commonly called *trumpet notes:* the ſecond, that four of the notes it does perform, are not in exact tune. See Note.—The ſame defects are found in the *trumpet marine;* and the reaſon is the ſame in both. See Trumpet Marine.

Trumpet Marine, is a muſical inſtrument conſiſting of three tables, which forms its triangular body.—It has a very long neck with one ſingle ſtring, very thick, mounted on a bridge, which is firm on one ſide, but tremulous on the other.—It is ſtruck by a bow with one hand, and with the other the ſtring is preſſed or ſtopped on the neck by the thumb.

It is the trembling of the bridge, when ſtruck, that makes it imitate the ſound of a *trumpet;* which it does to that perfection, that it is ſcarce poſſible to diſtinguiſh the one from the other.—And this is what has given it the denomination of *trumpet marine,* though, in propriety, it be a kind of monochord.

The *trumpet marine* has the ſame defects with the *trumpet,* viz. that it performs none but *trumpet* notes, and ſome of thoſe either too flat or too ſharp.—The reaſon, Mr. Fr. Roberts accounts for, only premiſing that common obſervation of two uniſon ſtrings, that if one be ſtruck, the other will move; the impulſes made on the air by one ſtring, ſetting another in motion, which lies in a diſpoſition to have its vibrations ſynchronous to them: to which it may be added, that a ſtring will move, not only at the ſtriking of an uniſon, but alſo at that of an 8th or 12th, there being no contrariety in the motions to hinder each other. See Unison, and Chord.

Now in the *trumpet marine* you do not ſtop cloſe, as in other inſtruments, but touch the ſtring gently with your thumb, whereby there is a mutual concurrence of the upper and lower part of the ſtring to produce the ſound.—Hence it is concluded, that the *trumpet marine* yields no muſical ſound, but when the ſtop makes the upper part of the ſtring an aliquot part of the remainder, and conſequently of the whole; otherwiſe the vibrations of the parts will ſtop one another, and make a ſound ſuitable to their motion, altogether confuſed. Now theſe aliquot parts, he ſhews, are the very ſtops which produce the *trumpet* notes.

Harmonical TRUMPET, is an inſtrument which imitates the ſound of a *trumpet*, and which reſembles it in every thing, excepting that it is longer, and conſiſts of more branches.—'Tis ordinarily called *ſackbut*. See SACKBUT.

Speaking TRUMPET, is a tube from ſix to fifteen foot long, made of tin, perfectly ſtrait, and with a very large aperture; the mouth-piece being big enough to receive both lips.

The mouth being applied hereto, it carries the voice to a very great diſtance, ſo as it may be heard diſtinctly a mile; whence its uſe at ſea.

The invention of this *trumpet* is held to be modern; and is commonly aſcribed to Sir Samuel Morland, who called it the *tuba ſtentorophonica*.—But Ath. Kircher ſeems to have a better title to the invention; for it is certain he had ſuch an inſtrument before ever Sir S. Morland thought of his.

Kircher, in his *phonurg.* ſays, that the tromba publiſhed laſt year in England, he invented 24 years before, and publiſhed in his *muſurgia*: he adds, that Jac. Albanus Ghibbiſius and Fr. Eſchinardus, aſcribe it to him; and that G. Schottus teſtifies of him, that he had ſuch an inſtrument in his chamber in the Roman college, with which he could call to, and receive anſwers from the porter.

Indeed, conſidering how famed Alexander the great's tube was, wherewith he uſed to ſpeak to his army, and which might be heard diſtinctly 100 ſtadia or furlongs, it is ſomewhat ſtrange the moderns ſhould pretend to the invention; the ſtentorophonic horn of Alexander, whereof there is a figure preſerved in the Vatican, being almoſt the ſame with that now in uſe. See STENTOROPHONIC.

Liſtening, or *Hearing* TRUMPET, is an inſtrument invented by Joſeph Landini, to aſſiſt the ear in hearing of perſons who ſpeak at a great diſtance, without the aſſiſtance of any ſpeaking trumpet. See HEARING, and EAR.

TRUMPETER, in anatomy. See BUCCINATOR.

TRUNCATED* *pyramid*, or *cone*, is one whoſe top or vertex is cut off by a plane parallel to its baſe. See PYRAMID, and CONE.

* The word is formed of the Latin, *truncare*, to cut off a part from the whole; whence alſo *truncus*, *trunchion*, &c. In heraldry they ſay *trunked*. See TRUNKED.

A *truncated* cone, or the fruſtum of that body, is ſometimes alſo called a *curty-cone*. See FRUSTUM. See alſo GAUGING.

TRUNCATED *roof*. See the article ROOF.

TRUNCHEON, of the French *troncon*, and the Latin *truncus*; a battoon; or a kind of ſhort ſtaff uſed by kings, generals, and great officers, as a mark of their command. See BATTOON.

Columns in TRUNCHEONS. See the article COLUMN.

TRUNDLE, is a kind of carriage with low wheels, whereon to draw heavy cumberſome burdens.

TRUNDLE *ſhot*, is an iron ſhot about 17 inches long, ſharp-pointed at both ends, with a round bowl of lead caſt upon it, about a hand breadth from each end. See SHOT.

TRUNK, TRUNCUS, the ſtem, or body of a tree; or that part between the ground and the place where it divides into branches. See STEM, BRANCH, and TREE.

In lopping of trees, nothing is left but the *trunk*. See PRUNING, SHROWDING, &c.

TRUNK is alſo uſed for the ſtump, or that part left over the root in felling.—Large trees when felled, ſhoot out from the *trunk*, and make a copſe or underwood.

'Tis by means of the *trunks* left rotting in the ground, that the waſtes in foreſts are diſcovered.

TRUNK, in anatomy is uſed for the buſto of the human body, excluſive of the head and limbs. See BUSTO.

TRUNK, *truncus*, is alſo uſed for the main body of an artery, or vein; in contra-diſtinction to the branches and ramifications thereof. See VEIN, and ARTERY.

The word is particularly applied to certain parts of the aorta and cava.—See *Tab. Anat.* (*Angeiol.*) *fig.* 5. *lit. a.* See alſo AORTA, and CAVA.

TRUNK, in architecture, is uſed for the fuſt, or ſhaft of a column.—Alſo, for that part of the pedeſtal between the baſe and the cornice, otherwiſe called the *dye*.—See *Tab. Archit. fig.* 24. *lit. y.* See alſo SHAFT, COLUMN, PEDESTAL, DYE, &c.

TRUNK, is alſo popularly uſed for the ſnout of an elephant: by naturaliſts called the *proboſcis* thereof. See PROBOSCIS.

TRUNK *roots*, of a plant, are little roots which grow out of the *trunks* of plants. See ROOT.

Theſe are of two kinds, 1. Such as vegetate by a direct deſcent, the place of their eruption being ſometimes all along the *trunk*, as in mints, &c. and ſometimes only in the utmoſt point, as in brambles.

2. Such as neither aſcend nor deſcend, but ſhoot forth at right-angles to the *trunk*; which therefore, though as to their office they are true roots, yet, as to their nature, are a medium between a *trunk* and a root.

TRUNKED, among heralds, is applied to trees cut off at each end, which are ſaid to be *trunked*, or *truncated*. See TRUNCATED.

TRUNNIONS or TRUNIONS, of a piece of ordnance, thoſe knobs or bunches of the gun's metal, which bear her up on the cheeks of the carriage. See GUN, CANNON, ORDINANCE, CARRIAGE, &c.

TRUNNION *ring*, is the ring about a cannon, next before the *trunnions*. See ORDINANCE.

TRUSS, TRUSSA, a bundle or certain quantity of hay, ſtraw, &c.

A *truſs* of hay is to contain fifty-ſix pounds, or half an hundred weight; thirty-ſix *truſſes* make a load.—In June and Auguſt the *truſs* is to weigh ſixty pounds, on forfeiture of 18*s. per truſs*.

A *truſs* of forrage, is as much as a trooper can carry on his horſe's crupper.

TRUSS, of flowers, is uſed by floriſts to ſignify many flowers growing together on the head of a ſtalk; as in the cowſlip, auricula, &c.

TRUSS is alſo uſed for a ſort of bandage or ligature, made of ſteel or the like matter, wherewith to keep up the parts in thoſe who have hernias or ruptures. See HERNIA, &c.

TRUSSES, in a ſhip, are ropes made faſt to the parrels of a yard; either to bind the yard to the maſt, when the ſhip rolls, or to hale down the yards in a ſtorm, &c.

TRUSSING, in falconry, is an hawk's raiſing any fowl or prey aloft, ſoaring up, and then deſcending with it to the ground. See HAWK, and FALCONRY.

TRUST. See the article CESTUI *qui truſt*.

TRUSTEE, one who has an eſtate, or money put or truſted in his hands for the uſe of another. See FIDEI *commiſſum*.

TRUSTRA. See the article TRISTRA.

TRUTH, *veritas*, a term uſed in oppoſition to *falſhood*; and applied to propoſitions which anſwer or accord to the nature and reality of the thing whereof ſomething is affirmed or denied. See PROPOSITION, &c.

Thus, when we ſay that 4 is the fourth part of twice 8; that propoſition is true, becauſe agreeable to the nature of thoſe numbers. See FALSHOOD.

Truth, according to Mr. Lock, conſiſts in the joining or ſeparating of ſigns as the things ſignified by them do agree or diſagree one with another.—Now the joining or ſeparating of ſigns, is what we call making of propoſitions.—*Truth* then, properly, belongs only to propoſitions, whereof there are two ſorts, mental and verbal; as there are two ſorts of ſigns commonly made uſe of, *viz.* ideas and words. See IDEA, and WORD.

Mental propoſitions, are thoſe wherein the ideas in our underſtanding are put together, or ſeparated by the mind perceiving or judging of their agreement or diſagreement.

Verbal propoſitions, are words put together, or ſeparated, in affirmative or negative ſentences:—So that propoſition conſiſts in joining or ſeparating of ſigns; and *truth* conſiſts in putting together or ſeparating thoſe ſigns, according as the things they ſtand for agree or diſagree.

Truth, therefore, as well as knowledge, may come under the diſtinction of *verbal* and *real*; that being only *verbal truth*, where terms are joined according to the agreement or diſagreement of the ideas they ſtand for, without regarding whether our ideas are ſuch as really have, or are capable of having any exiſtence in nature.—But it is then they contain *real truth*, when theſe ſigns are joined as our ideas agree; and when our ideas are ſuch, as we know are capable of having an exiſtence in nature; which in ſubſtances we cannot know, but by knowing that ſuch have exiſted. See SUBSTANCE.

Truth is the marking down in words the agreement or diſagreement of ideas, as it is.—Falſhood is the marking down in words the agreement or diſagreement of ideas, otherwiſe than it is: and ſo far as theſe ideas, thus marked by ſounds, agree to their archetypes, ſo far only is the *truth* real.

The knowledge of this *truth* conſiſts in knowing what ideas the words ſtand for, and the perception of the agreement or diſagreement of thoſe ideas, according as it is marked by thoſe words. See PROBABILITY, EVIDENCE, &c.

Beſides *truth* taken in the ſtrict ſenſe before-mentioned, which is alſo called *logical truth*, there are other ſorts of *truths*; as,

Moral TRUTH, which conſiſts in ſpeaking things according to the perſuaſion of our own minds; called alſo *veracity*.

Metaphyſical, or tranſcendental TRUTH, which is nothing but the real exiſtence of things conformable to the ideas which we have annexed to their names. See KNOWLEDGE. See alſo ERROR, &c.

In which ſenſe a clock may be ſaid to be *true*, when it anſwers the idea or intention of the perſon who made it.

Others will have metaphyſical *truth* to conſiſt in the agreement of a thing with the idea thereof in the divine underſtanding.

TRUTINA *hermetis*, is uſed among aſtrologers, for an artificial method of examining and rectifying a nativity, by means of the time of conception. See HOROSCOPE.

TRUTINATION,* the act of weighing or ballancing a thing. See WEIGHT, and BALANCE.

* The word is formed from the Latin *trutina, a pair of ſcales.*

TRYAL. See the article TRIAL.

To TRY, in the ſea language.—A ſhip is ſaid to *try*, or lie *a-try*, when ſhe has no ſails abroad but her main-ſail, or miſſen-ſail.

TRYPHERA,* Τρυφερα, in pharmacy, a denomination given to divers medicines eſpecially of the opiate kind.—The great *tryphera* is compoſed of opium, cinnamon, cloves, and ſeveral other ingredients: it is uſed to fortify the ſtomach, to ſtop fluxes, and for ſome diſeaſes of the womb.

* The word is formed from the Greek, τρυφερος, *delicate*, on account of their gentle and pleaſant operation, or according to others, becauſe they make thoſe who uſe them reſt.

The Saracenic *tryphera*, and Perſian *tryphera*, thus called, becauſe firſt introduced, the one by the Saracens, and the other by the Perſians, are both of them gentle purgatives.

TSCHIRNHAUSIANA *quadratrix.* See QUADRATRIX *Tſchirnhauſiana.*

TUB is uſed as a kind of meaſure, to denote the quantity of divers things.—A *tub* of tea, is a quantity of about 60 pounds. —A *tub* of camphire, is a quantity from 56 to 80 pounds.

TUBE, TUBUS, pipe, conduit, or canal; a cylinder, hollow within-ſide, either of lead, iron, wood, glaſs or other matter, for the air or ſome other fluid to have a free paſſage, or conveyance through.

The term is chiefly applied to thoſe uſed in phyſics, aſtronomy, anatomy, &c. On other ordinary occaſions, we more uſually ſay *pipe.* See PIPE.

In the memoirs of the French academy of ſciences, M. Varigon gives us a treatiſe on the proportions neceſſary for the diameters of *tubes*, to give preciſely any determinate quantities of water.—The reſult of his piece turns upon theſe two analogies; that the diminutions of the velocity of water, occaſioned by its friction againſt the ſides of *tubes*, are as the diameters; the *tubes* being ſuppoſed equally long: and the quantities of water iſſuing out at the *tubes*, are as the ſquare roots of their diameters, deducting out of them the quantity each is diminiſhed. See FLUID, FOUNTAIN, FRICTION, &c.

For the *tubes* of barometers and thermometers; ſee BAROMETER, and THERMOMETER.—For the aſcent of liquors in capillary *tubes*; ſee ASCENT, and CAPILLARY.

Alimentary TUBE. See DUCT.

Fallopian TUBE. See the article FALLOPIAN.

Stentorophonic TUBE. See STENTOROPHONIC.

Torricellian TUBE. See TORRICELLIAN *tube.*

TUBE, in aſtronomy, is ſometimes uſed for *teleſcope*; but more properly for that part thereof into which the lens's are fitted, and by which they are directed and uſed. See TELESCOPE.

The goodneſs of the *tube*, being of great importance to that of the teleſcope: we ſhall here add its ſtructure.

*The Conſtruction of a Draw-*TUBE *for a teleſcope.*—The chief points to be regarded here, are, that the *tube* be not troubleſome by its weight, nor liable to warp and diſturb the poſition of the glaſſes: ſo that any kind of *tube* will not ſerve in every caſe: but

1. If the *tube* be ſmall, 'tis beſt made of thin braſs plates covered with tin, and formed into pipes or draws, to ſlide within one another.

2. For long *tubes*, iron would be too heavy; for which reaſon ſome chuſe to make them of paper, thus:—A wooden cylinder is turned, of the length of the paper to be uſed; and of a diameter equal to that of the ſmalleſt draw. About this cylinder is rolled paper, till it be of a ſufficient thickneſs: when one pipe is dry, provide others after the ſame manner; ſtill making the laſt ſerve for a mould for the next, till you have enough for the length of the *tube* deſired. Laſtly, to the extremes of the draws are to be glewed wooden ferrils, that they may be drawn forth the better.

3. Since paper draws are apt to ſwell with moiſt weather, ſo as to ſpoil their ſliding; and in dry weather to ſhrink, which renders them looſe and tottering: in both which caſes, the ſituation of the lens's is eaſily diſturbed; the beſt method of making *tubes*, is as follows: glue parchment round a wooden cylinder, and let the parchment be coloured black, to prevent the reflected rays making any confuſion. Provide very thin ſlits of beech, and bending them into a cylinder, glue them carefully to the parchment: cover this wooden caſe with white parchment, and about its outer extreme make a little ring or ferril: after the ſame manner make another draw over the former; and then another, till you have enough for the length of the *tube.*

To the inner extremes of each draw, fit a wooden ferril, that the ſpurious rays ſtriking againſt the ſides, may be intercepted and loſt. In thoſe places where the lens's are to be put, it will be proper to furniſh the ferrils with female ſcrews. Provide a wooden cover to defend the object-glaſs from the duſt, and putting the eye-glaſs in its wooden ferril, faſten it by the ſcrew to the *tube.* Laſtly, provide a little wooden *tube* of a length equal to the diſtance the eye-glaſs is to be from the eye, and fit it to the other extreme of the *tube.*

TUBER, or TUBERCEE, in botany, a kind of round turgid root, in form of a knob or turnip. See ROOT.

The plants which produce ſuch roots, are hence denominated *tuberoſe* or *tuberous plants.* See TUBEROUS.

TUBER or TUBEROSITY, in medicine, is uſed for a knob or tumor growing naturally on any part; in oppoſition to tumors which ariſe accidentally, or from a diſeaſe. See TUMOR.

The ſame term is alſo uſed for a knot in a tree. See KNOT.

TUBERA *Terræ.* See the article TRUFFLES.

TUBERCULES, TUBERCLES, little tumors which ſuppurate and diſcharge pus; often found in the lungs. Quinc. See LUNGS, and PHTHISIS. See alſo PHYMA.

TUBEROUS, or TUBEROSE, an epithet given to ſuch roots as are round, and conſiſt of an uniform fleſhy ſubſtance: having neither ſkin, nor ſhell.—See TUBER, and ROOT.

Such are the roots of ſaffron, paiony, &c. See BULB.

TUBILUSTRIUM,* in antiquity, a feaſt or ceremony in uſe among the Romans.—This denomination was given to the day whereon they purified their ſacred trumpets; as alſo to the ceremony of purifying them.—It was held on the fifth and laſt day of the feaſt of Minerva called *quinquatrus*, or *quinquatria*, which was performed twice a year.

* The word is compounded of *tubus, trumpet,* and *luſtro, I purify.*

TUBULI *lactiferi*, in anatomy, is a name uſed by ſome writers, for thoſe ſmall tubes through which the milk flows to nipples of the mammæ or breaſts. See MILK, and BREAST.

TUBULI *vermiculares*, a name ſometimes uſed by naturaliſts, for certain ſmall winding cavities on the outſides of ſhells. See SHELL.

TUESDAY. See the article HOKE *Day.*

TUFT, a term uſed by ſome authors for the buſhy part of trees; or that part ſet with branches, leaves, &c. See BRANCH.

Paralleliſm of the TUFTS *of trees.*—All trees are obſerved naturally to affect to have their *tufts* parallel to the ſpot of ground they ſhadow; an account of which phenomenon, ſee under the article PARALLELISM.

TUILERIE,* or TYLERY, a *tyle-work*; a large building with a drying-place, covered a-top, but furniſhed with apertures on all ſides, through which the wind having admittance, dries the tyles, bricks, &c. in the ſhade, which the ſun would crack, before they be put in the kiln. See BRICK, and TYLE.

* The word is pure French, formed from *tuile, tyle.*

The garden of the Louvre is called the *Tuileries*, as being a place where tyles were anciently made, &c.—But the term *Tuileries* does not only include the garden; but alſo a magnificent palace, whoſe front takes up the whole length of the garden: and hence it is, that they ſay, the king lodges in the *Tuileries*; the king has quitted the *Tuileries* for a few days, to reſide in the Louvre.

The palace of the *Tuileries* is joined to the Louvre by a large gallery, which runs along the banks of the river Seine, and has its proſpects thereon.

The *Tuileries* was begun in 1564, by Catherine de Medicis, wife of Henry II. in the time of her regency; finiſhed by Henry IV. and magnificently adorned by Louis XIV.—The garden of the *Tuileries* was much improved by Louis XIII.

TUMBLER, a ſort of dog, called in Latin, *vertagus*, from his quality of tumbling and winding his body about, before he attacks and faſtens on the prey.

Theſe dogs are often leſs than hounds; being lanker, leaner, and ſomewhat pricked-eared; and by the form of their bodies, might be called mungrel grey-hounds, if they were a little bigger..

TUMBREL, TUMBRELLUM, an engine of puniſhment, which ought to be in every liberty, that has a view of frank-pledge, for the correction and cooling of ſcolds and unquiet women. See CUCKING-*ſtool.*

TUMEFACTION, the act of ſwelling, or riſing into a tumor. See TUMOR.

Inflammations and *tumefactions* of the teſtes, frequently happen in the gonorrhæa; either from the weakneſs of the veſſels, violent motion, unſeaſonable uſe of aſtringents, a neglect of purging, or the like. See GONORRHÆA.

TUMOR or TUMOUR, in medicine, &c. a preternatural riſing or eminence on any part of the body.

Tumor is defined by the phyſicians, a ſolution of continuity, ariſing from ſome humor collected in a certain part of the body, which disjoins the continuous parts, inſinuates itſelf between them, and deſtroys their proper form.

This has given occaſion to the Arabs to define a *tumor* to be an indiſpoſition, compoſed of three kinds of diſeaſes, *viz.* an intemperature, an ill conformation, and a ſolution of continuity; all which they compriſe under the name *apoſthem*, from the Greek, αποϛημα. See APOSTHUME.

Tumors may proceed from various cauſes.—The maſs of blood throwing off or diſcharging itſelf of any particular humor, as ſometimes happens in the criſis of a fever, pleuriſy, empyema, bubo, &c. will give riſe hereto.—And according to the nature of the humor ſo diſcharged, whether ſanguinious, watery, bilious, &c. the *tumor* is different.

Other *tumors* there are, occaſioned by flatulency, as the tympany, after the ſame manner as hydropical *tumors* are occaſioned by a collection of the lympha, or ſerum, in a particular part.—Ruptures of the inteſtines, or their ſtarting from their places, will likewiſe cauſe a *tumor*. See RUPTURE.

External injuries are another general cauſe of *tumors*.—Thus a contuſion, or a violent ſtricture of any part, a wound, fracture, diſlocation, *&c.* will make it ſwell, or riſe above its natural level. And the ſame thing may likewiſe happen from the bites of venomous creatures, *&c.* See WOUND, ULCER, CONTUSION, *&c.*

Tumors, properly ſo called, *i. e. humoral tumors*, or thoſe which contain a fluid matter, ariſe either from a ſtagnation, *i. e.* an obſtruction of the paſſage of ſome fluid, occaſioning a ſlow congeſtion, or from the tranſlation or fluxion of an humor from ſome other part; or from the generation of ſome new humor. See HUMOUR.

Tumors of the firſt kind are very numerous, and are uſually divided, with regard to the particular humors they are filled with, into *phlegmons*, which come from the blood. See PHLEGMON, and BLOOD.—Eryſipelas's, which are filled with bile. See ERYSIPELAS, and BILE.—Oedema's, filled with pituita. See OEDEMA, and PITUITA.—And ſcirrhus's, with melancholy. See SCIRRHUS.—To which may be added, flatulencies, filled with wind. See FLATUS, *&c.*

Of the ſecond kind, are *critical tumors*. See CRITICAL—And of the third kind, are cancers, ganglions, and all *tumors* contained in a cyſtis or bag. See CANCER, GANGLION, *&c.*

Tumors alſo frequently acquire peculiar denominations from the part affected; as, ophthalmia, if in the eye; parotis, about the ears; paronychia, in the fingers, *&c.* See OPHTHALMIA, *&c.*

With reſpect to the cure, all *tumors* are diviſible into *ſimple*, and *compound*, i. e. into ſuch as are of a kindly nature, and go off, or are cured in a reaſonable time, by the uſe of common means, without the appearance of any violent or dangerous ſymptoms; and ſuch as are more malignant, or prove difficult of cure, and are attended with bad ſymptoms, and affect the adjacent parts, or the whole body.—When a *tumor* is formed by fluxion, a ſudden pain, heat, tenſion and pulſation are felt in the part, and manifeſt ſigns of a fever appear.

In thoſe formed by congeſtion, the ſwelling riſes ſlowly, and the pain and other ſymptoms come on gradually, and prove leſs violent; unleſs it happen in the joints, and other of the more ſenſible parts.

All *tumors*, except thoſe from ruptures, terminate or are removed, either by diſcuſſion, ſuppuration, putrefaction, induration, or tranſlation. See DISCUTIENT, SUPPURATIVE, *&c.*

When a *tumor* is diſcuſſed, the part that was affected, appears relaxed, or reduced to its natural ſize and figure, and is free from pain and hardneſs. See DISCUSSION.

When a *tumor* haſtens to ſuppuration, a conſiderable degree of heat, pain and pulſation is felt in the part; and if the *tumor* be large, or lie deep, a fever generally comes on: when the matter is formed, theſe ſymptoms commonly decreaſe, and ſometimes totally vaniſh. And now, if the ſituation of the parts permits it, the *tumor* appears drawn to a point, or becomes conical in the middle, or moſt depending part, where the matter collected commonly proves white.—At this time likewiſe the *tumor* appears to be more contracted, and the ſkin of the part more ſhrivelled or flaccid than before: and now, upon preſſure, if the *tumor* be ſuperficial, or by vibrating it between the fingers, the matter may be felt to quaſh from ſide to ſide. See SUPPURATION.

Tumors in the fleſhy parts of the body, tend to their ſtate, or ſuppurate, faſter than *tumors* in the joints, glands, *&c.*

When a *tumor* is reſolved by induration, the ſwelling of the part and the pain decreaſe as the hardneſs comes on.—When it terminates in putrefaction or mortification, the part grows ſenſeleſs, and turns black and fœtid. See MORTIFICATION.

But when a *tumor* goes off by repulſion, or a return of the matter into the blood, it diſappears at once; upon which a fever, or ſome other acute diſeaſe preſently enſues. See REPELLENT.

Windy tumors, M. Littre deſcribes as formed of air, incloſed under ſome membrane, which it dilates more or leſs in proportion to the quantity, and from which it cannot eſcape; at leaſt not for ſome time.

The difficulty is, to conceive how the air ſhould come to be collected here.—M. Littre thinks that the moſt ordinary cauſe of *windy tumors*, is the gathering of juices in ſome neighbouring part, wherein there is an obſtruction. The air, which is intimately mixed with all the juices of the body, continues to be ſo while they are in their natural fluidity and motion; but if they be collected in any part, and by conſequence have their motion and fluidity diminiſhed, the air gets its liberty, and diſengages itſelf from them. Now the membranes of the part wherein the liquor is collected, becoming dilated by this collection, and their pores enlarged, the diſengaged air eſcapes through them, but the juice is left behind, as being too much thickned by its ſtay there: it therefore runs under ſome other neighbouring membrane, which it raiſes, ſwells and extends. See TYMPANITES.

TUN,* or TON, originally ſignifies a large veſſel or caſk, of an oblong form, biggeſt in the middle, and diminiſhing towards its two ends, girt about with hoops, and uſed to put up ſeveral kinds of merchandizes in, for their better carriage; as brandy, oil, ſugar, ſkins, hats, *&c.*

* Some derive the word from *autumnus*, in regard it is then *tuns* are moſt needed: Du Cange deduces it from *tunna* or *tonna*, words uſed in the baſe Latin for the ſame thing; whence alſo *tunnare*, to *tun*.

The term is alſo uſed for certain veſſels of extraordinary bigneſs, ſerving to keep wine in for ſeveral years.—In Germany there are many ſcarce ever emptied: the Heidelberg *tun* is famous.

The *tun*, we frequently call a *hogſhead*. See HOGSHEAD.

TUN, or TON, is alſo a certain meaſure for liquids; as wine, oil, *&c.* See MEASURE.

The Engliſh *tun* contains two pipes, or four hogſheads, or 252 gallons. See HOGSHEAD, GALLON, PIPE, *&c.*

The *tun* of Amſterdam contains 6 aems or awms; the aem 4 ankers, the anker 2 ſtekans, the ſtekan 16 mingles; 12 ſtekans are equal to an Engliſh barrel, or 63 gallons.

The *tun* of Bourdeaux and Bayonne contains four barrels, equal to three Paris muids.—At Orleans and Berry it is about two Paris muids. See MUID.

The *tun* of Malaga, Alicant, Sevil, *&c.* is two bottas, equal to about 36 or 37 ſtekans.—The *tun* of Liſbon is two Portugueſe bottas, equal to 25 ſtekans.

TUN is alſo a certain weight, whereby the burthen of ſhips, *&c.* are eſtimated. See WEIGHT, *&c.*

The *ſea tun* is computed to weigh two thouſand pounds, or twenty quintals or hundreds weight (amounting to 2440 pounds avoirdupois) ſo that when we ſay a veſſel carries two hundred *tuns*, we mean it is able to carry two hundred times the weight of two thouſand pounds, *i. e.* four hundred thouſand pounds: it being found by a curious obſervation, that the ſea water, whoſe room the veſſel fills when full loaden, weighs ſo much.

To find the burthen and capacity of a ſhip, they meaſure the hold, or place where ſhe is loaden; allowing 42 cubic feet to the *ſea tun*. See BURDEN, and HOLD.

The price of freight, or carriage of merchandizes, is ordinarily ſettled on the foot of the *ſea tun*: and yet though the *tun* is twenty hundred weight, there is ſome difference made therein, either on account of the weight or cumberſomneſs, or bulk of the commodities, the ſpace they take up, or the like. See FREIGHT.

Accordingly, at Bourdeaux four barrels of wine are held a *tun*, five barrels of brandy are eſtimated two *tuns*, three of ſyrup are one *tun*, four barrels of prunes one *tun*, two dozen of walnut-tree tables one *tun*, a dozen of planks one *tun*; twenty buſhels of cheſnuts are accounted one *tun*, and the like of wheat, or other grain; ten bales of cork, five bales of feathers, and eight of paper, make each one *tun*.

A *tun* or load of timber is 40 ſolid feet, if the timber be round: if it be hewed, or ſquare, 50. See TIMBER.

TUN, TON, in the end of words, or names of places, ſignifies a town, village, or dwelling-place.—From the Saxon, *tun*, *ſepes*, *vallum*, *villa*, *vicus*, *oppidum*; and this from ꝺon or ꝺun, a hill, where they formerly built towns. See TOWN.

TUN-GREVE, a term anciently uſed for a reeve or bailiff, *qui in villis, & quæ dicimus maneriis, domini perſonam ſuſtinet, ejuſque vice omnia diſponit & moderatur.* Spelman. See BAILIF, REVE, GREVE, *&c.*

TUNE, or TONE, in muſic, is that property of ſounds whereby they come under the relation of *acute* and *grave* to one another. See GRAVITY, *&c.* See alſo TONE.

Though gravity and acuteneſs be mere terms of relation, yet the ground of the relation, the *tune* of the ſound, is ſomething abſolute; every ſound having its own proper *tune*, which muſt be under ſome determinate meaſure in the nature of the thing.

The only difference then between one *tune* and another is in degrees, which are naturally infinite, *i. e.* we conceive there is ſomething poſitive in the cauſe of ſound, which is capable of leſs and more, and contains in it the meaſure of the degrees of *tune*; and becauſe we do not ſuppoſe a leaſt or greateſt quantity of this, we conceive the degrees depending on thoſe meaſures to be infinite. See SOUND.

If two or more ſounds be compared together in this relation, they are either equal or unequal in the degree of *tune*.—Such as are equal are called *uniſons*. See UNISON.

The unequal conſtitute what we call *intervals*, which are the differences of *tune* between ſounds. See INTERVAL.

Cauſe and meaſure of TUNE, *or that whereon the* tune *of a ſound depends.*—Sonorous bodies, we find, differ in *tune*, 1. According to the different kinds of matter: thus the ſound of a piece of gold is much graver than that of a piece of ſilver of the ſame ſhape and dimenſions; in which caſe, the *tones* are proportional to the ſpecific gravities.

2. According to the different quantities of the ſame matter in bodies of the ſame figure; as a ſolid ſphere of braſs, one foot

in diameter, ſounds acuter than a ſphere of braſs two foot in diameter; in which caſe the *tones* are proportional to the quantities of matter.

Here then are different *tunes* connected with different ſpecific gravities, and different quantities of matter; yet cannot the different degrees of *tune* be referred to thoſe quantities, &c. as the immediate cauſe. In effect, the meaſures of *tune* are only to be ſought in the relations of the motions that are the cauſe of ſound, which are no-where ſo diſcernible as in the vibrations of chords. See CHORD.

Sounds, we know, are produced in chords by their vibratory motions; not, indeed, by thoſe ſenſible vibrations of the whole chord, but by the inſenſible ones, which are influenced by the ſenſible, and, in all probability, are proportional to them.—So that ſounds may be as juſtly meaſured in the latter, as they could be in the former, did they fall under our ſenſes: but even the ſenſible vibrations are too ſmall and quick to be immediately meaſured.—The only reſource we have, is to find what proportion they have with ſome other thing: which is effected by the different tenſions, or thickneſs, or lengths of chords, which, in all other reſpects, excepting ſome one of thoſe mentioned, are the ſame. See VIBRATION.

Now, in the general, we find that in two chords, all things being equal, excepting the tenſion, or the thickneſs, or the length, the *tones* are different; there muſt therefore be a difference in the vibrations owing to thoſe different tenſions, &c. which difference can only be in the velocity of the courſes and recourſes of the chords, through the ſpaces wherein they move to and again.—Now, upon examining the proportion between that velocity, and the things juſt mentioned, whereon it depends, it is found to a demonſtration, that all the vibrations of the ſame chord are performed in equal times.

Hence, as the *tone* of a ſound depends on the nature of thoſe vibrations whoſe differences we can conceive no otherwiſe than as having different velocities, and as the ſmall vibrations of the ſame chord are all performed in equal time; and as it is found true in fact, that the ſound of any body ariſing from one individual ſtroke, though it grows gradually weaker, yet continues in the ſame *tone* from firſt to laſt; it follows, that the *tone* is neceſſarily connected with a certain quantity of time in making every ſingle vibration; or that a certain number of vibrations, accompliſhed in a given time, conſtitutes a certain and determinate *tune*: for the frequenter thoſe vibrations are, the more acute is the *tune*; and the ſlower and fewer they are in the ſame ſpace of time, by ſo much the more grave is the *tune*; ſo that any given note of a *tune*, is made by one certain meaſure of velocity of vibrations, *i. e.* ſuch a certain number of courſes and recourſes of a chord or ſtring in ſuch a certain ſpace of time, conſtitutes a determinate *tune*. See NOTE.

This theory is ſtrongly ſupported by our beſt and lateſt writers on muſic, Dr. Holder, Mr. Malcolm, &c. both from reaſon and experience.—Dr. Wallis, who owns it very reaſonable, adds, that it is evident the degrees of acuteneſs are reciprocally as the lengths of the chords; though, he ſays, he will not poſitively affirm that the degrees of acuteneſs anſwer the number of vibrations as their only true cauſe: but his diffidence ariſes hence, that he doubts whether the thing have been ſufficiently confirmed by experiment.—Indeed, whether the different number of vibrations in a given time be the true cauſe on the part of the object, of our perceiving a difference of *tune*, is a thing which we conceive does not come within the reach of experiment; it is ſufficient the hypotheſis is reaſonable. See CONCORD, HARMONY, &c.

TUNICA, a kind of waſtecoat or under-garment wore by the ancients, both at Rome and in the eaſt.

The common people ordinarily wore only a ſingle *tunica*; but thoſe of better faſhion wore a *toga* or gown over it.—See TOGA.—The philoſophers wore a gown without a *tunica*, as profeſſing to go half naked.

The *tunica* was peculiar to the men, the under-garment of the women not being called *tunica*, but *ſtola*. See STOLE.

The ſenators wore their *tunica* enriched with ſeveral little pieces of purple, cut in form of large nails; whence it was called *laticlavia*: the knights had leſſer nails on their *tunica*, which was hence called *anguſticlavia*: the common people wore their *tunica* without any clavi at all.—And it was by theſe three different ſorts of *tunica's*, that the three different orders of the Roman people were diſtinguiſhed. See LATICLAVIA, &c.

Among religious, the woollen ſhifts, or under-garments, are ſtiled *tunica's* or *tuniques*.

TUNICA, TUNIC, in anatomy, is applied to the membranes which inveſt the veſſels, and divers others of the leſs ſolid parts of the body.—See *Tab. Anat.* (*Angeiol.*) *fig.* 7. *lit. a a. b b. c. d.* See alſo MEMBRANE.

The eye conſiſts principally of a number of humors contained in *tunics* ranged over one another: as the *tunica albuginea*, the *tunica cornea*, the *tunica retiformis*, &c. See EYE, ALBUGINEA, &c.

TUNICA *Vaginalis*. See the article VAGINALIS.

TUNNAGE, or TONNAGE, a duty or cuſtom due for merchandize brought or carried in *tons*, and ſuch like veſſels, from or to other nations; thus called, becauſe rated at ſo much *per tun*. See CUSTOM.

Tunnage is properly a duty impoſed on liquids according to their meaſures; as poundage is that impoſed on other commodities according to their weight. See POUNDAGE.

They were both firſt ſettled by authority of parliament under king Edward III. were re-eſtabliſhed in 1660, under the reign of king Charles II. for his life, upon abrogating all the laws made under Oliver Cromwell, and re-ordaining the execution of the ancient laws and regulations: and have been continued and renewed by the parliaments ever ſince.—By an act made in the firſt year of the reign of Queen Anne, they were continued for 96 years, expiring in the year 1798.

This duty at firſt was 4*l.* 10*s.* ſterling *per tun*, for French wines brought into the port of London by the Engliſh, and only three for that brought into the other ports.—For the ſame wine imported by ſtrangers to London, this duty was 6*l.* and that brought into the other ports 4*l.* 10*s.* ſterling.

Rheniſh wine, in virtue of the ſame act, paid 7*l.* 10*s.* ſterling; and Spaniſh, Portugueſe, Malmſey, and Greek wines, the ſame as French wines.

But there have been divers additional duties impoſed ſince.—As the *additional duty of the old ſubſidy*, *ſeignorage*, *duty of ancient impoſt of* tunnage, *duty of additional impoſt*, *orphans money*, *new ſubſidy*, &c. See DUTY.

TUNNAGE is alſo uſed for a certain duty paid the mariners by the merchants for unloading their ſhips arrived in any haven, after the rate of ſo much *per tun*. See DUTY.

TUNNEL, or FUNNEL, an inſtrument through which any liquor is poured into a veſſel.

Part of the draught of a chimney, above the mantle-piece, is alſo called by the ſame name. See CHIMNEY.

TUNNEL-*Net*, is a kind of net much uſed for the catching of patridges; thus called from its form, which is a cone 15 or 18 feet long.

To uſe it, a covey of thoſe birds being found, a compaſs is taken, and the net pitched at a good diſtance from them, according to the ſituation of the ground.—Then, with a natural or artificial ſtalking horſe, they are ſurrounded, and gently driven towards the net, never coming on them in a direct line, but by windings, turnings, &c. See STALKING.

TUNNING, or TONNING, a part of the proceſs of brewing, or rather an operation which is the ſequel thereof. See BREWING.

The *tunning of beer*, &c. is performed various ways; ſome being of opinion it is beſt *tunned* as it cools, or begins to come; while others let it ſtand longer to become riper.

The moſt regular method is to cleanſe and *tun* juſt as it comes to a due ferment, and gets a good head; for then it has the moſt ſtrength to clear itſelf.—What works over is to be ſupplied with freſh beer of the ſame brewing.

TURBAN,* TURBANT, the head-dreſs of moſt of the eaſtern and mahometan nations; conſiſting of two parts, *viz.* a cap, and a ſhaſh of fine linnen, or taffaty, artfully wound in divers plaits about the cap.—See HAT, CAP, TIARA, &c.

The cap is red or green, without any brim, pretty flat, though roundiſh a-top, and quilted with cotton, but does not cover the ears.—About this is wrapped a long piece of fine thin linnen or cotton, in ſeveral wreaths variouſly diſpoſed.

There is a good deal of art in giving *turbans* the fine air; and the making them up conſtitutes a particular trade, as the making of hats does among us.

The Emirs, who pretend to be deſcended of the race of Mahomet, wear their *turbans* quite green: thoſe of the other Turks are ordinarily red, with a white ſhaſh.—Your genteel people are to have frequent changes of *turbans*.—M. de Tournefort obſerves, that the *turban*, all things conſidered, is a very commodious dreſs; and that he even found it more eaſy to him than his French habit.

The grand Seignior's *turban* is as big as a buſhel, and ſo exceedingly reſpected by the Turks, that they dare ſcarce touch it.—It is adorned with three plumes of feathers enriched with diamonds and precious ſtones: he has a miniſter on purpoſe to look to it, called *tulbentoglan*.

That of the grand vizier has two plumes: ſo have thoſe of divers other officers, only ſmaller one than another; others have only one, and others none at all.—The *turban* of the officers of the divan is of a peculiar form, and called *mugenezek*.

The ſhaſh of the Turks *turban*, we have obſerved, is white linnen, that of the Perſians is red woollen. Theſe are the diſtinguiſhing marks of their different religions, Sophi, king of Perſia, who was of the ſect of Ali, being the firſt who aſſumed that colour, to diſtinguiſh himſelf from the Turks, who are of the ſect of Omar, and whom the Perſians eſteem heretics. See KIRILBASCH, &c.

---

* The word is formed from the Arabic ראר, *dar*, or רור, *dur*, or ראל, *dal*, or רול, *dul*, which ſignifies to encompaſs; and בנר, *band* or *bend*, which ſignifies ſhaſh, or ſcarf, or band; ſo that *durbant*, or *turbant*, or *tulbant*, only ſignifies a ſcarf, or ſhaſh, tied round; it being the ſhaſh that gives the denomination to the whole *turban*.

TURBARY, TURBARIA, a right to dig turf in another man's ground; from *turba*, an old Latin word for a turf. See TURF.

Common of TURBARY, is a liberty which ſome tenants have by preſcription to dig on the lord's waſte. See COMMON.

TURBARIA is ſometimes alſo taken for the ground where turfs are digged. See TURF.

TURBARIA *Bruaria*, more particularly denotes flaw turf, or heath turf: mentioned in a charter of Hamon de Maſſy.

TURBINATED, is a term applied by naturaliſts to ſhells which are ſpiral, or wreathed, conically, from a larger baſis to a kind of apex. See SHELL.

TURBITH, or TURPETH, TURPETHUM, a medicinal root, brought from the Eaſt Indies, particularly Cambaya, Surat, and Goa; though others will have it, that the true *turbith* comes chiefly from Ceylon.

The *turbith* of the moderns bears ſo little reſemblance to that of the acients, that it is difficult to ſuppoſe them the ſame.—That ſold by our druggiſts is a longiſh root about the thickneſs of the finger, reſinous, heavy, and of browniſh hue without, and whitiſh within.—It is brought to us cloven in the middle, lengthwiſe, and the heart or woody matter taken out. When in the ground it ſhoots out tendrils, ſome whereof creep along the ground, and the reſt wind about the neighbouring trees and ſhrubs.

Turbith is a violent purgative, and is uſed in the dropſy, palſy, and apoplexy. See PURGATIVE.—It is commonly ſuppoſed to take its name *turbith* from *turbare*, on account of the violence of its operation, as diſturbing the whole oeconomy.

It yields a deal of reſinous matter in a ſpirituous menſtruum, which Dr. Quincy obſerves, does not affect the larger paſſages much; but is very active in the ſmaller veſſels, and glandulous contorſions, which it wonderfully clears of all viſcid adheſions. See PURGATIVE.

Some apothecaries, either through ignorance or parſimony, ſubſtitute white thapſia, which they call grey *turbith*, or *turbith garganicum*, for the true *turbith*; though both as to taſte, colour and qualities, they are very different.

Mineral TURBITH, TURPETHUM *Minerale*, is a name which the chymiſts give to a yellow precipitate of mercury, which purges violently. See MERCURY and PRECIPITATE.

The method of preparing it is thus:—on the dry powder gained by diſſolving mercury in oil of vitriol, pour a proper quantity of warm rain water, and the powder will immediately turn of a yellow colour. Continue to waſh this powder by repeated affuſions of water, till the liquor comes away as inſipid and colourleſs as it was poured on, leaving a beautiful yellow calx at the bottom of the veſſel, which being gently dried at the fire, is called by the name of *turbith mineral*.

This powder is called *mineral turbith* from the reſemblance it bears to the vegetable *turbith* of the Arabians, in ſtrongly purging the moſt internal receſſes of the body; for though it be inſipid upon the tongue, yet it is poſſeſſed of very conſiderable virtues.—Being boiled with water, it loſes more of its ſalts, and thereby grows milder, and more ſafe; ſo it does by being deflagrated twice or thrice, or diſtilled with ſpirit of wine.

A very few grains of this *turbith* will prove emetic and purgative.—It is alſo accounted an excellent medicine in the cure of the venereal diſeaſe: but as it operates with conſiderable violence, it ought not to be given, unleſs the viſcera are known to be ſound. See PURGATIVE.

This appears to have been the grand ſecret of Paracelſus, which, in his ſcarce German book of hoſpital medicines, he praiſes ſo extravagantly for the venereal and all chronical diſeaſes.—Sydenham alſo commends it in venereal caſes, given in the quantity of ſix or eight grains, in ſtrong habits of body, ſo as to prove emetic; but when imprudently uſed, it is apt to give the dyſentery. See VENEREAL *Diſeaſe*.

TURBO, in meteorology, a whirlwind. See VORTEX, WHIRLWIND, &c.

TURCICA *Sella*. See the article SELLA.

TURCOIS,* or TURQUOIS, in natural hiſtory, a precious ſtone, of a blue colour; ordinarily opake, but ſometimes a little tranſparent. See PRECIOUS *Stone*.

* The Greeks and Latins ſeem to have known it under the names *calais*, and κυανος: and it appears to have had a place in the rationale of the high prieſt of the Jews.

There are *turcoiſes* both oriental and occidental, of the new rock and the old. The oriental partakes more of the blue tincture than the green; and the occidental more of the green than the blue.—Thoſe of the old rock are a deep blue, and thoſe of the new rock more whitiſh, and do not keep their colour.

The oriental ones come from Perſia, the Indies, and ſome parts of Turky; and ſome even ſuppoſe that it is hence they derive their modern name *turcois*.—The occidental are found in various parts of Europe, particularly Germany, Bohemia, Sileſia, Spain, and France.

Turcoiſes all grow of a round or oval figure: they cut eaſily, and beſides ſeals, which are frequently engraved on them, ſome are formed into crucifixes, or other figures near two inches high; though de Boot miſtakenly affirms, that none have been known to exceed the bigneſs of a walnut.

The ancients attribute a kind of ſympathetic virtue to the *turcois*.—It is commonly ſuppoſed, that it changes colour, or breaks, at the death, ſickneſs, or even miſfortune of the perſon who bears it; that it diſagrees with married people, and even breaks on their fingers; that it marks all the changes and accidents that happen in the body of the wearer, by correſpondent changes in its colour; and that it is for this reaſon the ladies have forbore the uſe of it.—De Boot endeavours to account for all theſe effects from natural, and even probable cauſes.

The *turcois* is eaſily counterfeited; and that ſo perfectly, that it is impoſſible to diſcover the deceit, without taking it out of the collet.

In the memoirs of the academy of ſciences, we have a very curious account of the formation of the *turcois*, and the manner of giving it the blue colour, by M. Reaumur.—The *turcois*, he obſerves, is one of the ſofteſt of precious ſtones, its hardneſs ſcarce exceeding that of a cryſtal, or a tranſparent pebble; though ſome are much harder than others: and ſtill the harder, *cæteris paribus*, the more valuable, by reaſon of the vivacity of the poliſh, which is always proportionable to the hardneſs.

Roſnell, a jeweller, and the author of a ſcarce treatiſe, called *Mercure Indien*, eſtimating the ſeveral precious ſtones, ſets a hard *turcois*, whoſe blue is neither bright nor deep, on the foot of the moſt perfect emeralds, that is, on a level with a diamond.—Thoſe with any defect he only values at a French crown the carat.

Tavernier aſſures us, there are but two mines of *turcoiſes* known in all the earth, and thoſe are both in Perſia; the one called the *old rock*, near a town called Necabourg, three days journey to the north-eaſt of Meched: the other called the *new rock*, is five days journey.—The latter, he adds, are but little valued; and the king of Perſia hath for many years prohibited the digging in the former for any but himſelf.—M. Reaumur takes the old rock to be now exhauſted; in effect, the common diviſion of *turcoiſes* into the old rock, or oriental, and new rock, or occidental, is very arbitrary and precarious.—All the beſt, and moſt perfect, grow they where they will, in India or Europe, are reckoned among the former, and the reſt among the latter.

Near Simore, in the lower Languedoc, are ſeveral conſiderable mines of *turcoiſes*; but that fine blue colour admired in the *turcois*, is not natural to theſe rocks; the prevailing colour being ſometimes white, and ſometimes much like that of Tripoli of Venice. Other precious ſtones are dug out of the mine with all their colour, to the force whereof nothing can be added, though it may frequently be diminiſhed, as we ſee fire bring down the too deep colour of the ſapphire, and quite take away that of a pale ſapphire: theſe *turcoiſes*, on the contrary, are naturally whitiſh or yellowiſh, of a colour as common as that of a free-ſtone; and by oppoſing them for ſome time to the action of the fire, they aſſume a blue colour.

It ſeems a paradox, and yet M. Reaumur has made it exceeding probable, that *turcoiſes* are originally the bones of animals.—In the mines in France, pieces have ſeveral times been found of the figure of teeth, bones of the arms, legs, &c. And *turcoiſes* which are yet imperfect or half formed, are apparently compoſed of laminæ or leaves like thoſe of bones, between which ſome petrifying juice inſinuating itſelf, binds them cloſe together: and ſtill, the ſofter, and more imperfect the ſtones are, the more diſtinguiſhable are the different directions of the fibres and laminæ, with their interſections, and the greater reſemblance they bear to fractured bones, and the leſs to any kind of ſtones known.

To give them the blue colour, they dry them awhile in the air, then heat them gradually in a furnace made after a particular manner. If they be heated too haſtily, the humidity between the laminæ, wanting time to evaporate all, will ſeparate into ſcales or flaws. Some of the ſtones require a greater degree of heat to bring them to their colour than others; and even in large pieces, ſeveral parts ordinarily require ſeveral degrees of heat.

On this account a world of care is to be taken in the heating them; for the fire, which gives them their blue by degrees, if they be expoſed beyond a certain degree, takes it away again.

M. Reaumur accounts for their taking a blue colour by heat very well: when freſh cut out of the rock, it ſeems, their ſubſtance is found ſprinkled and ſtreaked all over with ſpots, veins, little circles, &c. of a dark-blue colour: theſe he takes to be remains of a deep bluiſh matter, which the fire rarefying, ſpreads and diffuſes throughout the whole ſubſtance of the ſtone.—This matter, again, he concludes to have been either originally the juice contained in the bones, ſince mixed and coagulated with the petrifying juice, or ſome other mineral matter inſinuated into the pores of the ſtone.

The great defect of all *turcoiſes* is, that in time they loſe their blue colour, and become green; and then ceaſe to be of any value.

TURF, *Peat*; a blackiſh ſulphurous earth, uſed in ſeveral parts of England, Holland, and Flanders, as fewel. See FEWEL, and TURBARY.

In Flanders, their *turf* is dug or pared from off the ſurface of the earth, and cut in form of bricks.—The gramen, a ſpecies of graſs growing very thick on the *turf* earth, contributes greatly, when dry, to the maintenance of the fire.

The Dutch draw their *turf* from the bottom of the dikes or canals which run acroſs moſt of their lands; by which means they not only ſupply the defect of wood, which is very great in moſt of the united provinces, but alſo keep their dikes clear and navigable: this *turf* earth is very black. As they take it up from the bottoms of the dikes, they ſpread it about the edges, of ſuch a thickneſs, as that it may be reduced to three inches when moderately dried.—In this condition they cut it into pieces or *turfs* ſeven or eight inches long, and three broad; and, to compleat the drying, lay them up in heaps, and at laſt in ſtacks.

In the north of England, Scotland, &c. *turf* or peat is dug out of a ſoft, moiſt, rotten earth, called *peat-moſs*: for the formation whereof ſee MOSS.

They dig horizontally from the ſurface, to the depth of about four foot, with a ſpade, which at once faſhions and takes them out in parallelipipeds nine or ten inches long, and three ſquare; which are ſpread on the ground to drain as faſt as dug; and then ſet up an end three or four againſt each other, for the wind to blow through them; and at laſt ſtacked or houſed.—The pits or dikes in a few years fill up again, and afford a freſh crop.

TURFING-*ſpade*, among huſbandmen, is an inſtrument uſed to under-cut the *turf*, after it is marked out with a trenching-plough.

TURGESCENCE, TURGESCENCY, a ſwelling, or growing bloated. See ORGASM.

TURIONES, the firſt young tender ſhoots which plants annually put forth. See GEM, CYON, &c.

TURKISH *coins*,	See the articles	COIN.
TURKISH *meaſures*,		MEASURE.
TURKISH *moneys*,		MONEY.
TURKISH *year*,		YEAR.
TURKY *company*,	See the articles	COMPANY.
TURKY *ſilk*,		SILK.

TURLUPINADE, a term uſed chiefly among the French for a low jeſt, or witticiſm.—The occaſion of the name is derived from a famous comedian at Paris, called *Turlupin*; whoſe talent, like that of our Penkethman, conſiſted chiefly in raiſing a laugh by miſerable puns and quibbles.

TURLUPINES, TURLUPINI, a ſect of heretics, or rather of people who made public profeſſion of impudence, going naked, without ſo much as covering their privy parts, and having to do with women, like the Cynics, in open market.

They called their ſect the *fraternity of the poor*, and ſpread themſelves over England and France.—They are ſaid by ſome to have had their name *turlupins, quod ea tantum habitarent loca quæ lupis expoſita erant.* See ADAMITE.

They attempted to ſettle themſelves at Paris in 1372, but were a great part of them burnt, with their books; as is related by Gaguin and du Tillet in the life of Charles V.

TURMERIC, *Curcuma*, a medicinal root, uſed likewiſe by the dyers, to give a yellow colour. See YELLOW.

It is yellow both within and without ſide, very hard, as if petrified, and not unlike, either in figure or ſize, to ginger.—The leaves it produces are like thoſe of white hellebore; its flowers riſe in form of a ſpica or ear; and its fruit rough like our new cheſnuts.

It is brought chiefly from the Eaſt-Indies; though the iſland Madagaſcar does likewiſe afford it.—You are to chuſe that which is big, new, reſinous, hard to break, and heavy.

Some people have miſtakenly imagined there was a native red *turmeric*; their error was owing to this, that the yellow root, as it grows old, turns brown; and when pulveriſed reddiſh.

It is much uſed by the glovers, &c. to dye their gloves; as alſo by the founders, &c. to give a gold colour to braſs.—The Indians uſe it to dye their rice, and other foods, of a yellow colour; whence ſome call it *Indian ſaffron*.

Our dyers do not find that it gives ſo ſteady a yellow as the luteola or weld; but it is admirable to brighten and heighten the red colours died with cochineal or vermilion; as ſcarlets, &c. See DYING.

Turmeric is uſed in medicine by way of decoction, infuſion, powder, &c. with other ingredients, in hypochondriac, leucophlegmatic, and cachectical conſtitutions. It is held a ſort of ſpecifick in the jaundice, and dropſy.

TURN, is uſed for a circular motion; in which ſenſe it coincides with *revolution*. See REVOLUTION.

TURN, in a clock or watch-work, particularly denotes the revolution of a wheel, or pinion. See WHEEL, PINION, &c.

In calculation, the number of *turns* which the pinion hath in one *turn* of the wheel, is commonly ſet down as a quotient in common arithmetic, thus, 5)60(12, where the pinion 5 playing in a wheel of 60, moves round 12 times in one *turn* of the wheel.—Now, by knowing the number of *turns*, which any pinion hath in one *turn* of the wheel it works in, you may alſo find how many *turns* a wheel or pinion has at a greater diſtance; as the contrat-wheel, crown-wheel, &c. by multiplying together the quotients, and the number produced, is the number of *turns*; as in this example:

5) 55 (11
5) 45 (9
5) 40 (8

The firſt of theſe three numbers has 11 *turns*, the next 9, and the laſt 8. If you multiply 11 by 9, it produceth 99; that is, in one *turn* of the wheel 55, there are 99 *turns* of the ſecond pinion 5, or the wheel 40, which runs concentrical, or on the ſame arbor with the ſecond pinion 5.—If you multiply 99 by the laſt quotient 8, it produces 792, which is the number of *turns* the third pinion 5 hath.

TURN, or TOURN, is alſo uſed for the ſheriff's court, kept twice a year in every hundred within his county, *viz.* a month after Eaſter, and within a month after Michaelmas. See SHERIFF, COURT, and COUNTY.

From this court none are exempted but archbiſhops, biſhops, earls, barons, religious men and women, and all ſuch as have hundreds of their own to be kept. See HUNDRED.

It is a court of record in all things that pertain to it; and is alſo the king's leet through all the county, whereof the ſheriff is judge; this court being incident to his office.—The attendance on it is called *ſecta regalis*, or *ſuit-royal*. See SUIT.

It is called the *ſheriff's turn*, becauſe he takes a *turn* or circuit for this purpoſe through the ſhire, holding the ſame in ſeveral places.

TURNADO, or TORNADO, a wind which on ſome coaſts blows all night from the ſhore. See WIND, WHIRLWIND, TRADE-WIND, MONSOON, &c.

TURNAMENT, or TOURNAMENT, a martial ſport or exerciſe, which the ancient cavaliers uſed to perform, to ſhew their bravery, and addreſs.

The firſt *turnaments* were only courſes on horſeback, wherein the cavaliers tilted at each other with canes, in manner of lances; and were diſtinguiſhed from *juſts*, which were courſes or careers, accompanied with attacks and combats with blunted lances and ſwords.

Others ſay, it was a *turnament* when there was only one quadril or troop; and that where there were ſeveral to encounter each other, it was a juſt.—But it is certain the two became confounded together in proceſs of time; at leaſt we find them ſo in authors. See JUST.

The prince who publiſhed the *turnament*, uſed to ſend a king at arms with a ſafe conduct, and a ſword to all the princes, knights, &c. ſignifying, that he intended a *turnament* and a claſhing of ſwords, in the preſence of ladies and damſels: which was the uſual formula of invitation.

They firſt engaged man againſt man, then troop againſt troop; and after the combat, the judges allotted the prize to the beſt cavalier, and the beſt ſtriker of ſwords; who was, accordingly, conducted in pomp to the lady of the *turnament*; where, after thanking her very reverently, he ſaluted her, and likewiſe her two maids.

Theſe *turnaments* made the principal diverſion of the XIIIth and XIVth centuries.—Munſter ſays, it was Henry the Fowler, duke of Saxony, and afterwards emperor, that firſt introduced them; but it appears from the chronicle of Tours, that the true inventor of this famous ſport, was one Geoffry, lord of Preuilli, about the year 1066.

From France they paſſed into England and Germany.—The *Hiſtoria Byzantina* tells us, that the Greeks and Latins borrowed the uſe thereof from the Franks; and we find mention made of them in Cantacuzenus, Gregorias, Beſſarion, and others of the late Greek authors.

Budæus derives the word from *trojana agmina*; others from *trojamentum, quaſi ludus trojæ.* Menage deduces it from the Latin, *tornenſis*, or the French, *tourner*, in regard the combatants turned and twiſted this way and that. M. Paris calls them in Latin, *haſtiludia*; Neubrigenſis, *meditationes militares*; others *gladiaturæ*, others *decurſiones ludicræ*, &c.

Pope Eugenius II. excommunicated thoſe who went to *turnaments*, and forbad them burial in holy ground.—K. Henry II. of France died of a wound received at a *turnament*.—One Chiaoux, who had aſſiſted at a *turnament* under Charles VIII. ſaid very happily, *If it be in earneſt, it is too little; if in jeſt, too much.*

It is to the exerciſe of *turnaments* that we owe the firſt uſe of armories; of which the name blazonry, the form of the eſcutcheons, the colours, principal figures, the mantlings, labels, ſupporters, &c. are undeniable evidences. See ARMS.

In Germany, it was anciently a cuſtom to hold a ſolemn *turnament* every three years, to ſerve as a proof of nobility.—For the gentleman who had aſſiſted at two, was ſufficiently blazoned and publiſhed; *i. e.* he was acknowledged noble, and bore two trumpets by way of creſt on his *turnament* caſk.—Thoſe who had not been in any *turnaments*, had no arms, though they were gentlemen. See NOBILITY, DESCENT, &c.

TURNESOL, or TORNESOL, *Heliotrope*, or the *Sun-flower*; a plant whoſe flower is ſaid to follow the motion of the ſun, and to turn ſtill towards it.

Some ſay, it is hence it takes its name, and account for the effect, by ſuppoſing that its heavy ſtalk, warmed and ſoftened with the heat which is ſtrongeſt on that ſide toward the ſun, inclines naturally towards the ſame; but others take the opinion to have had its riſe from the name, which was given it by reaſon of its appearance in the time of the greateſt heats, when the ſun is in the tropic.

Some have imagined the ſun-flower of uſe in medicine; but its reputation that way is now out of doors. Its principal uſe is in dying: in order to which, its juice is inſpiſſated and prepared with calx and urine, into blue cakes; uſed alſo with ſtarch, inſtead of ſmalt. See BLUE, SMALT, *&c.*

Its juice likewiſe furniſhes the colour wherewith the people of Languedoc and ſome other parts of France, where it grows, prepare what they call the *tourneſol en drapeaux*, or *tourneſol in rags*. The proceſs whereof we owe to M. Niſſole of the royal academy of ſciences, and is as follows:

The ſummets or tops of the plants being gathered in the beginning of Auguſt, are ground in mills, not unlike our oil-mills: then, being put up in bags, the juice is expreſſed with preſſes.

This juice having been expoſed to the ſun about an hour, they dip linnen rags therein, and hang them out in the air till they be well dried again. When, moiſtening them for ſome time, over the vapour of about ten pound weight of quick lime ſlaked in a ſufficient quantity of urine, they lay them out again to the ſun to dry; to be again dipped in the juice of the ricinoides.

When they are dried for the laſt time, they are in their perfection; and are thus ſent into moſt parts of Europe, where they are uſed to tinge wines and other liquors, and give them an agreeable colour.

The Dutch prepare a kind of *turneſol* in paſtes or cakes, or ſtones; pretended to be the juice of that plant inſpiſſated: but there is reaſon to think it a cheat, and to be the juice of ſome other plant prepared after this manner; the *turneſol* being no plant of their growth.

TURNETUM, in our old law-books, a duty paid to the ſheriff for holding his turn, or county-court. See TURN, and SHERIFF.

TURNING, a branch of ſculpture; being the art of faſhioning hard bodies, as braſs, ivory, wood, *&c.* into a round or oval form, in a lathe. See LATHE.

Turning is performed by putting the ſubſtance to be *turned* upon two points, as an axis; and moving it about on that axis; while an edge-tool, ſet ſteady to the outſide of the ſubſtance, in a circumvolution thereof, cuts off all the parts that lie further off the axis, and makes the outſide of that ſubſtance concentric to the axis.

The invention of *turning* appears to be very ancient.—Some, indeed, to do honour to the age, will have it brought to perfection by the moderns; but if what Pliny, and ſome other ancient authors relate, be true, that the ancients *turned* thoſe precious vaſes, enriched with figures and ornaments in relievo, which we ſtill ſee in the cabinets of the curious; it muſt be owned, that all that has been added in theſe ages, makes but a poor amends for what we loſt of the manner of *turning* of the ancients. See SCULPTURE.

The principal inſtruments uſed in *turning*, beſide the lathe, are chiſſels and mandrels of various forms; the deſcription whereof ſee under their proper articles.

TURNING *paliſades*, } See the articles { PALISADE.
TURN-UP *compaſſes*, } { COMPASSES.

TURNPIKE, a gate ſet up acroſs a road, watched by an officer for the purpoſe, in order to ſtop travellers, waggons, coaches, *&c.* to take toll of them, towards repairing, or keeping the roads in repair. See ROAD.

TURNPIKE is alſo uſed in the military art, for a beam ſtuck full of ſpikes, to be placed in a gap, a breach, or at the entrance of a camp, to keep off an enemy. See CHEVAL *de Friſe*.

The *turnpike*, called alſo *cheval de friſe*, is a ſpar of timber, twelve or fourteen feet long, and about ſix inches diameter; of a ſexangular form, and bored with holes, one right under another, about an inch diameter; the axis of the holes being ſix inches one from another, and to go in from each ſide.—The ſpikes or pickets that are driven into the holes, are five or ſix feet long, pointed with iron; and with wedges or nails faſtened tight into the holes.

Two of theſe faſtened together with an iron chain and ſtaple, ſix inches long, are of great uſe to ſtop the enemy in the breaches or elſewhere.

Thoſe intended to be thrown into breaches, muſt be made of oak; and need not be ſo big, or the pickets ſo long.

TURPENTINE, TEREBINTHINA, a tranſparent ſort of reſin, flowing either naturally or by inciſion, from ſeveral unctuous and reſinous trees—as the terebinthus, larch, pine, fir, *&c.* See RESIN.

We diſtinguiſh ſeveral kinds of *turpentines*; as that of Chio, that of Venice, that of Bourdeaux, that of Cyprus, Straſbourg, *&c.*

The *turpentine* of Chio, or Sio, which is the only genuine kind, and that which gives the denomination to all the reſt, is a whitiſh reſin, bordering a little on green, very clear and a little odoriferous; drawn by inciſion from a tree called *terebinthus*, very common in that iſland, as alſo in Cyprus, and ſome parts of France and Spain.

The reſin muſt be choſen of a ſolid conſiſtence, almoſt without either taſte or ſmell, and not at all tenacious, which diſtinguiſhes it from the falſe *turpentine* of Venice, commonly ſubſtituted for it, which has a briſker ſmell, a bitter taſte, and ſticks much to the finger.—This *turpentine* of Chio is indiſputably the beſt; but its ſcarcity occaſions it to be little in uſe.

The *turpentine* of Venice is falſely ſo called; for though there was a *turpentine* anciently brought from Venice, yet that now ſo called comes from Dauphiné.—It is liquid, of the conſiſtence of a thick ſyrup, and whitiſh; and flows either ſpontaneouſly, or by inciſion from the larch-tree, chiefly in the wood de Pilatze.

That flowing naturally, called by the peaſants *bijon*, is a kind of balſom, not inferior in virtue to that of Peru, for which it is frequently ſubſtituted.—That drawn by inciſion, after the tree has ceaſed to yield ſpontaneouſly, is of conſiderable uſe in ſeveral arts, and it is even of this that varniſh is chiefly made. See VARNISH.—It muſt be choſen white and tranſparent, and care be taken it have not been counterfeited with oil of *turpentine*.

The *turpentine* of Bourdeaux is white and thick as honey.—It does not ooze from the tree in the manner it is ſent to us; but is properly a compoſition, wherein, among other ingredients, is a white hard ſort of reſin called *galipot*. See PITCH.

The *turpentine* of Straſbourg, the produce of the abies or ſilver fir, is that moſt commonly uſed among us; and is preferred, by our people, to that of Venice, which it is diſtinguiſhed from by its green hue, fragrant ſmell, and citron flavour.

The uſes of *turpentine* in medicine are innumerable.—It is a great vulnerary, and very detergent, and as ſuch is preſcribed in abſceſſes, and ulcerations, *&c.* It promotes expectoration, and as ſuch is preſcribed in diſeaſes of the lungs, and breaſt: but it is moſt famous for clearing the urinary paſſages, and as ſuch preſcribed in obſtructions of the reins, in gonorrheas, *&c.*

Oil of TURPENTINE.—There are two kinds of oils drawn from *turpentine* by diſtillation; the firſt white, the ſecond red; both eſteemed as balſoms proper for the cure of wounds, chilblains, *&c.* But they are ſo little uſed among us, that it is not eaſy to procure either of them.

What is commonly ſold under the name of *oil of turpentine*, or *etherial oil*, is only a diſtillation of the reſinous juice of the tree freſh as it is gathered.—It is uſed with ſucceſs in the cure of green wounds, as alſo by the painters, farriers, *&c.*—To be good, it muſt be clear and white as water, of a ſtrong penetrating ſmell, and very inflammable.

TURPETH, } See the articles { TURPITH.
TURQUOIS, } { TURCOIS

TURUNDA, in medicine and chirurgery, *tent*, *pellet*, or *penecil*; a piece of lint thruſt into a wound, ulcer, or other cavity. See TENT, and PENECILLUS.

TUSCAN, in architecture, the firſt, ſimpleſt, and moſt maſſive of the five orders.—See *Tab. Archit. fig.* 24. See alſo the article ORDER.

The *Tuſcan order* takes its name from an ancient people of Lydia, who coming out of Aſia to people Tuſcany, firſt executed it in ſome temples, which they built in their new plantations.

Vitruvius calls the *Tuſcan* the *ruſtic order*; with whom agrees M. de Cambray, who in his parallel ſays, it ought never to be uſed but in country-houſes and palaces. M. le Clerc adds, that in the manner Vitruvius, Palladio, and ſome others, have ordered it, it does not deſerve to be uſed at all. But in Vignola's manner of compoſition, he allows it a beauty, even in its ſimplicity; and ſuch as makes it proper not only for private houſes, but even for public buildings, as in the piazzas of ſquares and markets; in the magazines and granaries of cities, and even in the offices and lower apartments in palaces.

The *Tuſcan* has its character and proportions as well as the other orders; but we have no ancient monuments to give us any regular *Tuſcan* order for a ſtandard.

M. Perrault obſerves, that the characters of the *Tuſcan* are nearly the ſame with thoſe of the Doric; and adds, that the *Tuſcan* is, in effect, no other than the Doric, made ſomewhat ſtronger, by ſhortening the ſhaft of the column; and ſimpler, by the ſmall number, and largeneſs of the mouldings. See DORIC.

Vitruvius makes the whole height of the order 14 modules, wherein he is followed by Vignola, M. le Clerc, *&c.*—Serlio only makes it 12.—Palladio gives us one *Tuſcan* profile, much the ſame as that of Vitruvius; and another too rich: on which ſide Scammozi is likewiſe faulty. Hence it is, that that of Vignola, who has made the order very regular, is moſt followed by the modern architects. See COLUMN.

Of all the orders, the *Tuſcan* is the moſt eaſily executed; as having neither triglyphs nor dentils, nor modillions to cramp its intercolumns.—On this account the columns of this order may be ranged in any of the five manners of Vitruvius, *viz.*

the pycnoſtyle, ſyſtyle, euſtyle, diaſtyle, or aræoſtyle. See INTERCOLUMNATION.—For the parts and members of the *Tuſcan* order, their proportions, *&c.* ſee CAPITAL, BASE, PEDESTAL, FREEZE, *&c.*

TUSCULAN, in matters of literature, is a term which frequently occurs in the phraſe, *tuſculan queſtions*.—Cicero's *tuſculan queſtions*, are diſputations on ſeveral topics in moral philoſophy, which that great author took occaſion to denominate from *Tuſculanum*, the name of a country-ſeat or villa, where they were compoſed, and where he lays the ſcene of the diſpute.

They contain five books: the firſt on the contempt of death; the ſecond of enduring pain; the third on aſſwaging grief; the fourth on the other perturbations of the mind; and the laſt, to ſhew, that virtue is ſufficient to a happy life.

TUSKES, or TUSKS *of a horſe*. See TOOTH.

TUSSIS. See the article COUGH.

TUT, in armory, *&c.* an imperial enſign of a golden globe, with a croſs on it.

TUTELARY, TUTELARIS, one who has taken ſomething into his patronage, and protection. See GUARDIAN, PROTECTION, *&c.*

It is an ancient opinion, that there are *tutelary* angels of kingdoms and cities, and even of particular perſons, called *guardian angels*. See ANGEL, DÆMON, GENIUS, *&c.*

The ancient Romans, it is certain, had their *tutelary* gods, whom they called *penates*. See PENATES.—And the Romiſh church to this day, hold an opinion not much unlike it: they believe that every perſon, at leaſt every one of the faithful, has, from the time of his birth, one of thoſe *tutelary* angels attached to his perſon, to defend him from all temptations; and it is on this, principally, that their practice of invoking angels is founded.

F. Anthony Macedo, a Portugueſe jeſuit of Coimbra, has publiſhed a large work in folio, on the *tutelary* ſaints of all the kingdoms, provinces and great cities of the chriſtian world: *divi tutelares orbis chriſtiani*, at Liſbon 1687. See PATRON, SAINT, *&c.*

TUTOR, in the civil law, is one choſen to look to the perſon and eſtate of children, left by their fathers and mothers in their minority. See GUARDIAN, MINOR, and PUBERTY.

By the cuſtom of Normandy, the father is the natural *tutor* of his children.—A perſon nominated *tutor*, either by teſtament, or by the relations of the minor, may decline that office, if he have five children alive; if he have any other conſiderable *tutorage*; if he be under 25 years of age; if he be a prieſt or a regent in an univerſity; or if he have any law-ſuit with the minors, *&c.* See TUTORAGE.

The marriage of a pupil, without the conſent of his *tutor*, is invalid.—*Tutors* may do any thing for their pupils, but nothing againſt them; and the ſame laws which put them under a neceſſity of preſerving the intereſt of the minors, put them under an incapacity of hurting them. See PUPIL.

Honourary TUTOR. See the article HONOURARY.

TUTOR is alſo uſed in our univerſities, for a member of ſome college or hall, who takes on him the inſtructing young ſtudents in the arts and faculties. See UNIVERSITY.

TUTORAGE, TUTELA, in the civil law, a term equivalent to guardianſhip in the common law; ſignifying an office impoſed on any one, to take care of the perſon and effects of one or more minors. See MINOR, TUTOR, *&c.*

By the Roman law, there are three kinds of *tutorage*.—*Teſtamentary*, which is appointed by the father's teſtament.—*Legal*, which is given by the law to the neareſt relation.—And *dative*, which is appointed by the magiſtrate.

But in all cuſtomary provinces, as France, *&c.* all *tutorages* are dative and elective; and though the father have by teſtament, nominated the next relation to his pupil, yet is not that nomination of any force, unleſs the choice be confirmed by that of the magiſtrate, *&c.*

By the Roman law, *tutorage* expires at 14 years of age; but in France not till 25 years. A minor quits his *tutorage*, and becomes free by marriage; in which caſe a curator is given him. See CURATOR, and GUARDIAN.

TUTTY, TUTIA, or *Lapis* TUTIÆ, a kind of metallic ſoot, thrown off from braſs, in the furnace, and formed into concave flakes of different ſizes, and thickneſs; very hard, greyiſh, and full of little protuberant grains as big as pins heads. See CADMIA, POMPHOLYX, SPODIUM, *&c.*

It is found adhering to rolls of earth ſuſpended for that purpoſe over the furnaces of the founders in braſs, to receive the fumes of the melted metal. See COPPER, FOUNDERY, *&c.*

Tutty is now brought chiefly from Germany. Anciently, it came from Alexandria.—To prepare the *tutty* for uſe, they heat it red hot three times in a crucible, among burning coals; and quench it as often in roſe-water: then they grind it on a porphyry ſtone, mixing it with as much roſe-water, or plantain-water as is neceſſary, till it be brought to a very fine powder: then they make it up into little troches, and thus dry it.

Tutty is very deſiccative. Its principal uſe is in diſeaſes of the eyes, particularly inflammations; in order to which, it is to be diluted with roſe-water, or plantain-water, and applied in form of a collyrium. See COLLYRIUM.

Some alſo uſe it incorporated with hog's lard, or freſh butter, in the form of an unguent.—In the *London Diſpenſatory*, we have a compoſition called *ointment of tutty*, good for eye-diſeaſes; and frequently alſo uſed by ſurgeons with other dryers to cicatrize ulcers.—It is alſo reputed good in the hæmorrhoids. It is made up with calamine, and unguentum roſaceum.

TWA-NIGHTS *Geſte*, in our ancient cuſtoms. See THIRD-*night-awn Hynde*.

If the *twa-nights geſte* did any harm to any, his hoſt was not anſwerable for it, but himſelf. See HOGENHINE.

TWELF-HIND, in our ancient cuſtoms, imports much the ſame with *thane*. See THANE.

Among the Engliſh Saxons, every man was valued at a certain price; and when an injury was done, either to the perſon or goods, a pecuniary mulct was impoſed, and paid in ſatisfaction of that injury, according to the worth and quality of the perſon to whom it was done.—And hence all men were ranked in three claſſes; which ſee in HINDENI, and TWIHINDI.

Thoſe who were worth 1200 *s.* were called *twelve-hindi*, and if an injury was done to them, ſatisfaction was to be made accordingly. See SYXHINDEMEN.

TWELFTH-DAY, or TWELFTH-*Tide*, the feſtival of the Epiphany, or the manifeſtation of Chriſt to the Gentiles; ſo called, as being the *twelfth-day*, excluſive, from the nativity, or Chriſtmas-day. See EPIPHANY.

TWELVE-MEN, *duodecim homines legales*, otherwiſe called *jury*, or *inqueſt*, is a number of *twelve* perſons, or upwards to twenty-four; by whoſe oath, as to matters of fact, all trials paſs, both in civil and criminal caſes, through all courts of the common law in this realm. See JURY, and TRIAL.

In civil caſes, when proof is made of the matter in queſtion, the point of fact, whereon they are to give their verdict, is delivered to them; which is called the *iſſue*.—Then they are put in mind of their oath, and are by the judge's ſumming the evidence, ſent out of court by themſelves, to conſider on the evidence on both ſides, till they be agreed. See ENQUEST.

In cauſes criminal, there are two ſorts of inqueſts or juries: the *grand inqueſt*, and the *inqueſt of life and death*.—The firſt is ſo called, becauſe it conſiſts of ſixteen perſons at leaſt, or becauſe all cauſes criminal or penal paſs through their hands; whereas the other inqueſt is eſpecially appointed for one or more matters. Thoſe of the grand inqueſt are called by Bracton, *duodecim milites*, becauſe they were wont to be knights; if ſo many could be had. See KNIGHT.

Their function is to receive all preſentments of any offence, and accordingly to give their general opinion thereof, by writing either the words *billa vera* upon the bill of preſentment, which is an indictment of the party preſented: or elſe *ignoramus*, which is a doubting of the fact preſented. See IGNORAMUS, BILLA VERA, and INDICTMENT.

Laws of the TWELVE *Tables*. See the article TABLE.

TWELVE-MONTH, the ſpace of a year, according to the calendar months. See YEAR, and MONTH.

TWI-FALLOWING *of Ground*, in huſbandry, is the tilling or ploughing it a ſecond time. See TILLING, and PLOUGHING.

TWI-HINDI, or TWYHINDI, among our Saxon anceſtors, were men valued at 200 *s.* See TWELFHINDUS, and HINDENI.

Theſe men were of the loweſt degree; and if ſuch were killed, the mulct was 30 *s.*—Thus in *Leg. H.* I. *c.* 9. *de* twihindi *hominis interfecti, wera debit reddi ſecundum legem.*—Where note, that this was not an introduction of a new law, but a confirmation of the old, made in the reign of king Alfred.

TWINS, two young ones delivered at a birth by an animal which ordinarily brings forth but one. See BIRTH.

It has been greatly diſputed, which of two *twins* is to be eſteemed the elder?—The faculty of Montpellier have given it, that the latter born is to be reputed the elder, becauſe firſt conceived: but by all the laws which now obtain, the firſt-born enjoys the privileges of ſeniority; and the cuſtom is confirmed by the inſtance of Eſau and Jacob.

But if two *twins* be born ſo intermixed, that one cannot diſtinguiſh which of the two appeared the firſt, it ſhould ſeem that neither the one nor the other can pretend to the right of primogeniture, which ought to remain in ſuſpence, by reaſon of their mutual concourſe.

In ſuch caſe, ſome would have the deciſion left to the father, and others to the chance of a lot. Sometimes there are born three *twins*, as in the inſtances of the *Horatii* and *Curiatii*; and ſometimes there have been known four, or even five or more. See FOETUS, and EMBRYO.

TWINS, in aſtronomy. See the article GEMINI.

TWIST *of a rope, cord*, &c. See ROPE, CORDAGE, CABLE, *&c.*

TWIST, again, is uſed for the inſide, or flat part of a man's thigh, upon which a true horſeman reſts when on horſeback. See THIGH.

To TWIST *a horſe*, is violently to wring or twiſt his teſticles twice about, which cauſes them to dry up, and deprives them of nouriſhment, and reduces the horſe to the ſame ſtate of impotency with a gelding. See GELDING.

TWISTED *Column*, } See the articles { COLUMN.
TWISTED *Silks*, } { SILK.

TWO *thirds Subſidy*. See the article DUTY.

TYCHONIC *Syſtem*, or *Hypotheſis*, is an order or arrangement of the heavenly bodies, of an intermediate nature between the Copernican and Ptolemaic, or participating alike of them both. See SYSTEM.

It takes its name from Tycho Brahe, a noble Dane, of whom ſome account is hereafter given, under the article URANIBOURG.

In this ſyſtem, the earth is, with Ptolemy, placed in the middle, and ſuppoſed immoveable; and the ſun and moon to revolve in orbits, reſpecting the ſame as a centre: but the other five planets are ſuppoſed, with Copernicus, to revolve round the ſun as their centre.—So that the orbits of the three ſuperior planets include the earth, but not thoſe of the inferior ones, by reaſon they are nearer to the ſun than the earth is.

Accordingly, the heavens are here ſuppoſed to be fluid; and to conſiſt of three different orbs or ſpheres; the firſt moveable, ſuppoſed to make a revolution in 24 hours; the ſecond the ſphere of the planets; and the third the firmament, or region of the fixed ſtars.—See the diſpoſition of the heavenly bodies in this ſyſtem, repreſented in *Tab. Aſtronomy*, *fig.* 45.

Some later aſtronomers finding the Ptolemaic ſyſtem diſagree with phænomena; and not daring to make the earth move; but at the ſame time diſliking the *Tychonic* notion of two centres, one of them moveable, *viz.* the ſun, and the other fixed, the earth; have framed a new ſyſtem out of the Ptolemaic and *Tychonic*, called the *Semi-Tychonic*; wherein not only the Sun and Moon, but Jupiter alſo and Saturn, are ſuppoſed to move in excentrics or deferents, reſpecting the earth as a centre, though revolving at the ſame time in their reſpective epicycles.—But even here, the inferior planets are ſtill ſuppoſed to move round the ſun as their centre; their phaſes, obſerved with the teleſcope, being no otherwiſe accountable for. See SUN, MOON, PLANET, &c.

TYLE,* or **TILE**, in building, a ſort of thin, factitious, laminated ſtone, uſed in the roofs of houſes; or, more properly, a kind of fat, clayey earth, knodden and moulded of a juſt thickneſs, dried and burnt in a kiln, like a brick, and uſed in the covering and paving of houſes. See BRICK, and COVERING.

* It is thus called from the French, *tuile*, of the Latin, *tegula*, which ſignifies the ſame.

Tyles are made, ſays M. Leybourn, of better earth than brick-earth, and ſomething nearer akin to the potter's earth.—According to *ſtat.* 17 Edw. IV. the earth for *tyles* ſhould be caſt up before the firſt of November, ſhired and turned before the firſt of February, and not made into *tyles* before the firſt of March; and ſhould likewiſe be tried and ſevered from ſtones, marle and chalk.—For the method of burning them, ſee BRICK.

As to the applying of *tyles*; ſome lay them dry, as they come from the kiln, without mortar or any thing elſe: others lay them in a kind of mortar made of loam and horſe-dung.—In ſome parts, as in Kent, they lay them in moſs.

There are various kinds of *tyles*, for the various occaſions of building; as, *plain*, *thack*, *ridge*, *roof*, *creaſe*, *gutter*, *pan*, *crooked*, *flemiſh*, *corner*, *hip*, *dorman*, *dormar*, *ſcallop*, *aſtragal*, *traverſe*, *paving* and *dutch tyles*.

Plain or *thack* **TYLES**, are thoſe in ordinary uſe for the covering of houſes. They are ſqueezed flat, while yet ſoft, in a mould.—They are of an oblong figure, and by *ſtat.* 17 Edw. IV. c. 4. are to be 10½ inches long, 6¼ broad, and half an inch and half a quarter thick. But theſe dimenſions are not over-ſtrictly kept to.

Ridge, *roof* or *creaſe* **TYLES**, are thoſe uſed to cover the ridges of houſes; being made circular, breadth-wiſe, like a half cylinder.—Theſe are what Pliny calls *laterculi*, and are by ſtatute to be 13 inches long, and of the ſame thickneſs with the *plain tyles*.

Hip or *corner* **TYLES**, are thoſe which lie on the hips or corners of roofs.—As to form; they are firſt made flat, like *plain tyles*, but of a quadrangular figure, whoſe two ſides are right lines, and two ends, arches of circles; one end being a little concave, and the other convex: the convex end to be about ſeven times as broad as the concave end; ſo that they would be triangular, but that one corner is taken off: then, before they are burnt, they are bent on a mould, breadth-wiſe, like *ridge tyles*.—They have a hole at their narrow end, to nail them on by; and are laid with their narrow end upwards. By ſtatute, they are to be 10½ inches long, and of a convenient breadth and thickneſs.

Gutter **TYLES**, are thoſe which lie in gutters or valleys in croſs-buildings.—They are made like *corner tyles*, only the corners of the broad end are turned back again with two wings.—They have no holes in them, but are laid with the broad end upwards, without any nailing.—They are made in the ſame mould as *corner tyles*, and have the ſame dimenſions on the convex ſide. Their wings are each 4 inches broad and 8 long.

Pan, *crooked*, or *Flemiſh* **TYLES**, are uſed in covering of ſheds, lean-to's, and all kinds of flat-roofed buildings.—They are in form of an oblong parallelogram, as *plain tyles*; but are bent breadthwiſe forwards and backwards, in form of an S, only one of the arches is at leaſt three times as big as the other; which biggeſt arch is always laid uppermoſt, and the leſſer arch of another *tyle* lies over the edge of the great arch of the former.—They have no holes for pins, but hang on the laths by a knot of their own earth: they are uſually 14½ inches long, and 10½ broad. By 12 G. I. c. 25. they are to be, when burnt, not leſs than 13½ inches long, 9½ wide, and half an inch thick.

Dormar or *dorman* **TYLES**, conſiſt of a plain *tyle* and a triangular piece of a plain one, ſtanding up at right angles to one ſide of the plain *tyle*, and ſwept with an arch of a circle from the other end, which end terminates in a point.—Of theſe *tyles* there are two kinds; the triangular piece, in ſome, ſtanding on the right, in others on the left ſide of the plain *tyle*.—And of each of theſe, again, there are two kinds; ſome having a whole plain *tyle*, others but half a plain *tyle*. But in them all, the plain *tyle* has two holes for the pins, at that end where the broad end of the triangular piece ſtands.

Their uſe is to be laid in the gutters, betwixt the roof and the cheeks or ſides of the dormars, the plain part lying on the roof, and the triangular part ſtanding perpendicularly by the cheek of the dormar.—They are excellent to keep out the wet in thoſe places, and yet are not perhaps known any where but in Suſſex.—The dimenſions of the plain *tyle* part are the ſame as thoſe of a plain *tyle*, and the triangular part is of the ſame length, and its breadth at one end 7 inches, and at the other nothing.

Scallop or *aſtragal* **TYLES**, are in all reſpects like plain *tyles*, only their lower ends are in form of an aſtragal, *viz.* a ſemicircle, with a ſquare on each ſide.—They are uſed in ſome places for weather *tyling*.

Traverſe **TYLES**, are a kind of irregular plain *tyles*, having the pin-holes broke out, or one of the lower corners broke off.—Theſe are laid with the broken end upwards, upon rafters, where pinned *tyles* cannot hang.

Flemiſh or *Dutch* **TYLES**, are of two kinds, *ancient* and *modern*.—The *ancient* were uſed for chimney-foot foot-paces: they were painted with antic figures, and frequently with poſtures of ſoldiers, ſome with compartments, and ſometimes with moreſque devices; but came much ſhort, both as to the deſign and colours of the modern ones.

The *modern Flemiſh tyles* are commonly uſed plaiſtered up in the jaumbs of chimneys, inſtead of chimney-corner-ſtones.—Theſe are better glazed, and ſuch as are painted (for ſome are only white) much better performed than the ancient ones.

But both kinds ſeem to be made of the ſame whitiſh clay as our white glazed earthen ware.—The ancient ones are five inches and a quarter ſquare, and about three quarters of an inch thick: the modern ones ſix inches and a half ſquare, and three quarters of an inch thick.

TYLER, one that covers or paves with tyles.

Tylers and bricklayers were *incorporated* 10 Eliz. under the name of Maſter and wardens of the ſociety of freemen of the myſtery and art of *tylers* and bricklayers. See BRICK.

TYLERY. See the article TUILERIE.

TYLWITH, in matters of heraldry and deſcent, is ſometimes uſed for a tribe or family branching out of another; which the modern heralds more uſually call the *ſecond* or *third houſe*.

TYMBER *of Skins*. See the article TIMBER.

TYMPAN, or **TYMPANUM**, in architecture, the area of a pediment: being that part which is in a level with the naked of the freeze.—Or it is the ſpace included between the three cornices of a triangular pediment, or the two cornices of a circular one.—See *Tab. Archit. fig.* 36. *lit. e.* See alſo the article PEDIMENT.

Sometimes the *tympan* is cut out, and the part filled with an iron lattice to give light; and ſometimes it is enriched with ſculpture, in baſſo relievo, as in the weſt front of St. Paul's, the temple of Caſtor and Pollux at Naples, &c.

TYMPAN is alſo uſed for that part of a pedeſtal, called the *trunk* or *dye*. See PEDESTAL, and DYE.

TYMPAN, among joiners, is alſo applied to the pannels of doors. See PANNEL.

TYMPAN *of an Arch*, is a triangular ſpace or table in the corners or ſides of the arch; uſually hollowed and enriched, ſometimes with branches of laurel, olive-tree, or oak; or with trophies, &c. ſometimes with flying figures, as fame, &c. or ſitting figures, as the cardinal virtues. See ARCH.

TYMPAN, in anatomy, mechanics, &c. See the article TYMPANUM.

TYMPAN, among printers, is a double frame belonging to the preſs, covered with parchment, on which the blank ſheets are laid, in order to be printed off. See PRINTING *Preſs*.

TYMPANITES, or TYMPANY, in medicine, a flatulent tumor, or ſwelling of the abdomen or belly; very hard, equable, and permanent; whereby the ſkin is ſtretched ſo tight, that when ſtruck, it gives a ſound like that of a drum. See TUMOR.

The *tympanites* is a ſpecies of dropſy, by ſome called a *dry dropſy:* but what the cauſe and ſeat of the diſeaſe is, or what the morbific matter is that occaſions the tumour, phyſicians are not at all agreed. See DROPSY.

Wind certainly makes a principal part of the morbid matter; but this is ſcarce ever found without water, excepting at the beginning; ſo that ſome will not allow of any difference between the *tympany* and the *aſcites*.

Some ſuppoſe it to ariſe from a watry humour extravaſated and rarified into vapour; and by a property common to it with common air, corrupting the parts.—But this, Boerhaave makes a particular kind of *tympanites*, or wind dropſy; and adds, that it is cured like the aſcites, or water dropſy, by tapping, *&c.* See PARACENTESIS, and ASCITES.

Others will have the *tympanites* to ariſe from the air's inſinuating itſelf through perforations in the putrified inteſtines.—A *tympanites* from this cauſe, Boerhaave, who makes it a peculiar claſs, obſerves, is almoſt always incurable.

Willis ſets aſide this latter cauſe, and accounts for the diſeaſe from an irregularity in the animal ſpirits belonging to the viſcera, which ruſhing tumultuarily into the nervous fibres, bloat them up: thus is the peritoneum inflated, the inteſtines diſtended, and the meſentery, and other viſcera, rendered turgid; and while this is doing, that the vacuities left in the tumified viſcera may be filled up, a quantity of the humour contained in them is rarified into vapour, which preſently ſpreads in blaſts through the vacant places.—Others account for the *tympanites* from a convulſion of the muſcles of the abdomen, *&c.*

M. Littre has propoſed a new ſyſtem of the *tympanites*, built on a great number of obſervations.—According to him, it does not proceed from any convulſion of the abdominal muſcles, nor from any air contained in the cavity thereof, or in the thorax, the meſentery, or epiploon; but from the air incloſed in the ſtomach and inteſtines, which ſwells them exceſſively.

This air, always carried into thoſe parts with the food, maintains a kind of equilibrium therein; oppoſing on the one hand, the too great preſſure on that long canal when empty of food; and finding, on the other ſide, in the ſpring of the coats of the ſtomach and inteſtines, an obſtacle capable of preventing its too great dilatation.

If this equilibrium chance to be deſtroyed by the irritation of the fibres, whoſe ſpring in that caſe prevails over that of the air, this latter is expelled either upwards or downwards, or both: (whence belching, *&c.*) But if the equilibrium come to be broke by the force of the air, rendered ſuperior to that of the fibres, by thoſe latter being left deſtitute of ſpirits, from the blood's being impoveriſhed after a long ſickneſs; in that caſe, the air rarifying itſelf beyond meaſure, ſwells the cavities it is contained in.

If it be demanded, why when the ſtomach and inteſtines are ſo full of wind, none of the wind eſcapes, either through the anus, or by the mouth, which uſes to be expelled by thoſe paſſages?

M. Mery ſolves the paradox thus: according to this theory, the fibres, both of the ſtomach and inteſtines have loſt their ſpring, at leaſt in part, and are in an imperfect palſy; but the winds evacuated either by the anus or mouth, are winds which thoſe viſcera expel out of their cavities, by putting them in a ſtate of contraction capable of ſurmounting the forces which oppoſe the egreſs of the matters contained in thoſe cavities.—Theſe forces are two ſphincters, one whereof ſhuts the upper orifice of the ſtomach, and the other the anus: but paralytic viſcera, *i. e.* viſcera deſtitute of ſpirits, in which alone conſiſts the ſtrength of the muſcles, cannot overcome the reſiſtance of thoſe two muſcles: whence the wind, therefore, cannot eſcape through its uſual out-lets.

The *tympanites* rarely kills of itſelf; but frequently degenerates into an aſcites.—Cathartics rather aggravate than alleviate it: antihyſterics, antiſcorbutics, chalybeats, and ſtrengthners are of uſe, before it be commenced an aſcites. Equal quantities of leek and elder leaves mixed analytically, is a famed empirical medicine, which has often proved effectual when every thing elſe had failed.

It is uſual to apply carminatives to the belly, as the emplaiſter of cummin-ſeeds, *&c.* and alſo to uſe carminatives mixed with cathartics, diuretics, *&c.* internally: but if the diſeaſe proceed from a paralytic cauſe, deſtroying the tone of the fibres of the firſt paſſages, what is of uſe in rectifying paralytic diſorders, where the tenſion of the fibres is inſufficient, will doubtleſs for the ſame reaſon be of uſe here. See PALSY.

TYMPANUM, ΤΥΜΠΑΝΟΝ, *drum*; a muſical inſtrument, which, among the ancients, conſiſted of a thin piece of leather or ſkin, ſtretched upon a circle of wood or iron, and beat with the hand. See DRUM.

TYMPANUM, TYMPAN, in mechanics, is a kind of wheel placed round an axis or cylindrical beam, on the top of which are two levers or fixed ſtaves, for the more eaſy turning the axis about, in order to raiſe a weight required. See WHEEL.

The *tympanum* is much the ſame with the peritrochium; but that the cylinder of the axis of the peritrochium is much ſhorter and leſſer than the cylinder of the *tympanum*. See PERITROCHIUM.

TYMPANUM of a machine, is alſo uſed for any hollow wheel, wherein one or more people, or other animals, walk to turn it; ſuch as that of ſome cranes, calenders, *&c.* See WHEEL.

TYMPANUM, in anatomy.—*Membrana* TYMPANI, is a thin tender ſkin or membrane, ſtretched upon a bony circle, in the meatus auditorius of the ear, which it ſhuts; and ſuppoſed to be the immediate organ of hearing.—See *Tab. Anat.* (Oſteol.) *fig.* 13. *lit. c.* See alſo EAR.

The *tympanum*, popularly called the *drum*, with reſpect to the erect poſture of the body, is ſituate obliquely, facing downwards; whence it is that we hear ſounds coming from below, better than thoſe from above. See DRUM.

Its external ſurface is a little hollow in the middle.—It is compoſed of two membranes, or, as others will have it, of only two or more lamellæ of one.—It has a perforation, or, at leaſt a diſengaged part, which admits of the paſſage of wind, and, in ſome, of ſmoak from the meatus a palato. See FORAMEN.

Behind it, is a cavity of the os petroſum, called *tympani cavitas*, and ſometimes ſimply *tympanum*; wherein are four little bones, *viz.* the *malleolus*, *incus*, *ſtapes*, and *os orbiculare:* which ſee under their reſpective articles, MALLEOLUS, *&c.*

Within the *cavitas tympani*, Vieuſſens has diſcovered a very fine thin membrane, ſerving to ſhut the door of the labyrinth, and prevent the internal air from having any communication with the external.—The *membrana tympani* has a remarkable branch of a nerve paſſing on its internal ſurface between the incus and malleolus, called the *chorda tympani*. See CHORDA.

The *tympanum*, Dr. Willis takes to be a kind of preparatory inſtrument to hearing; and its office to be, to receive the firſt impreſſions of ſounds, or the ſenſible ſpecies, and to convey them duly modified and proportioned to the ſenſorium. See SOUND, SENSATION, *&c.*

Its office, in effect, with reſpect to the ſenſe of hearing, ſeems to be the ſame as that of the pupil of the eye with regard to ſeeing: each of them prevent the ingreſs of too many rays, temper and ſoften them, and deliver them, as it were, commenſurate to the ſenſory; upon which, if they ſhould fall immediately, they might be apt to ſpoil its delicate conſtitution. See PUPIL.

The *tympanum*, it is true, does not hear: but it contributes to the better and ſafer hearing.—That it may do the office of a porter the better, it is neceſſary its expanſe ſhould, like the pupil, be contracted and relaxed on occaſion; and to this purpoſe ſerve the four little bones above-mentioned, which have the ſame uſe in ſtraining and relaxing, as the braces of the war drum have in that inſtrument.—By means of this extenſion and retraction, the *tympanum* is made to correſpond to all ſounds loud or languid; as the pupil does to all the degrees of light. See HEARING.

The ingenious Dr. Holder has improved on this theory. He conceives that the action of the muſcle, whereby the *tympanum* is ſtretched and relaxed, does ordinarily and conſtantly draw it to a moderate tenſion; but when we have occaſion to liſten, and give a particular attention to any ſound, the action of that muſcle is then more intenſe, and the drum is drawn to a more than ordinary tenſion, to facilitate the paſſage of the ſound. See ATTENTION.

Upon theſe conſiderations, that author having a young gentleman, who was born deaf, put into his hands, and perceiving the great defect to lie in the want of a due tenſion of the *tympanum*, he adviſed his mother to conſult with phyſicians, whether by ſome aſtringent fumes, or otherwiſe, it might not be reſtored to a due tenſion.

In the mean time, he thought of a temporary way, by the pulſe of any vehement ſound; as of a drum beaten near him: which ſound, during its continuance, muſt needs give the *tympanum* a tenſion, by driving and ſwelling it outwards, as a freſh gale of wind fills the ſails of a ſhip. And the experiment ſucceeded according to expectation: for ſo long as he beat a drum faſt and loud by him, he could hear thoſe that ſtood by him call him gently by his name. But when the drum ceaſed, he could no longer hear the ſame perſons calling him very loudly. See DEAFNESS.

But what makes the uſe of the *tympanum* appear the leſs conſiderable is, that there are inſtances where the hearing has been perfect, without any uſe of a *tympanum*.—Mr. Cheſelden relates, that he broke the *tympanum* in both ears of a dog, yet it did not deſtroy his hearing; though for ſome time afterwards he received ſtrong ſounds with great horror: He adds, that Mr. St. Andre aſſured him, that a patient of his had the *tympanum* deſtroyed by an ulcer, and the auditory bones caſt out, without deſtroying his hearing.

Chorda TYMPANI. See the article CHORD.

TYMPANUM, in architecture. See the article TYMPAN.

TYMPANY, TYMPANIAS, or TYMPANITES, in medicine. See the article TYMPANITES.

TYPE,* TYPUS, a copy, image, or reſemblance of ſome model. See MODEL, IMAGE, *&c.*

* The word is formed from the Greek, τυπος, *form, figure.*

The term *type* is leſs in uſe than its compounds *prototype* and *archetype*, which are the originals that are made without models. See ARCHETYPE, PROTOTYPE, ECTYPE, *&c.*

TYPE is alſo a ſcholaſtic term, much uſed among divines, ſignifying a ſymbol, ſign, or figure of ſomething to come.

In this ſenſe, the word is commonly uſed with relation to *antitype*, αντιτυπος, which is the thing itſelf, whereof that is a *type*, or figure. See ANTITYPE.

Thus, Abraham's ſacrifice, the paſchal lamb, *&c.* were *types*, or figures of our redemption: the brazen ſerpent was a *type* of the croſs, *&c.*

Types are not mere conformities, or analogies, which the nature of things holds forth between them; nor arbitrary images ariſing merely from the caſual reſemblance of things: but there is further required a particular inſtitution of God to make a *type*; a particular declaration of his that it is ſo.

Gale divides *types* into *hiſtorical* and *prophetical.*—The firſt are thoſe uſed by the ancient prophets in their agitations and viſions: the ſecond, thoſe wherein things done, or ceremonies inſtituted in the Old Teſtament, prefigure Chriſt, or things relating to him in the New Teſtament.

The ancient fathers, as well as the modern critics, have been greatly divided about the nature and uſe of *types*, and *typical* repreſentations, in the Old Teſtament; and it is this makes one of the great difficulties in underſtanding the ancient prophecies, and in reconciling the New and Old Teſtament together. See PROPHECY.

There is no denying but that there were *types* which the divine wiſdom inſtituted to be the ſhadows and figures of things to come; and yet people run into an exceſs that way: ſome looking for *types* in every thing; like Origen, who diſcovered myſteries in the very caldrons of the tabernacle.—One ſhould be contented with the more ſenſible and obvious ones; nor propoſe any without proving them as much as poſſible, and ſhewing that they were really intended for *types*, in order to juſtify the ſolidity of the reaſoning of the apoſtles, who argued from them.

A late author maintains, that not the fathers only, but St. Paul himſelf, was of the opinion, that "Chriſtianity was all "contained in the Old Teſtament, was implied in the Jewiſh "hiſtory and law; both which are to be reputed *types* and "ſhadows of Chriſtianity."—In order to which, he quotes Hebrews viii. 5. x. 1. and Coloſ. ii. 16, 17.—He adds, "That the ritual laws of Moſes, being in their own nature "no other than *types* and ſhadows of future good things, are "to be conſidered as having the effect of prophecies."—This is likewiſe the ſenſe of Mr. Whiſton, and others; but the ſame author even quotes our Saviour ſpeaking in behalf of this *typical* reaſoning, in that paſſage Matth. xi. 13. where he affirms, that "The law propheſies; and that he came to fulfil "the law as well as the goſpel," Matth. v. 17. *Diſc. of the Grounds*, &c.

An ingenious divine takes this occaſion to obſerve, that had the ancients, with the modern retainers to the *typical* way, expreſly deſigned to have expoſed Chriſtianity, they could not have done it more effectually than by thus making every thing *types* and prophecies.—It is no wonder, he adds, that atheiſts and deiſts ſcoff at the credulity of Chriſtians, and reject what is ſupported by ſuch folly and abſurdity.

Not that he denies the reality of ſuch thing as *types.*—It is manifeſt, there were many under the Old Teſtament; ſuch were Zachariah's ſtaves, beauty and bands, ch. xi. 7, 10, 14; ſuch was Hoſea's adulterous wife, ch. i. 2; and ſuch were his children, ver. 4, 6.—The prophets deſigned by theſe to prefigure future events; but in theſe inſtances the reader is at once, by the declaration of the prophet, made to underſtand as much, and not left to his own conjectures about them, after the events are over.

In effect, all this is urged from ſcripture for the *typical* or allegorical interpretation of the Jewiſh law, hiſtory, ceremonies, *&c.* it is aſſerted, may be ſet aſide, without any violence to the ſacred text, which may be explained on more natural and intelligible principles, and more conſiſtently with grammar. See ALLEGORICAL.

The word τυπος, we have obſerved, literally denotes no more than a copy or impreſſion of any thing; and accordingly, in our tranſlation, we find it ſometimes rendered by *print*, ſometimes by *figure*, ſometimes by *faſhion*, and ſometimes by *form.*—Hence alſo the word is figuratively applied to denote a moral pattern; in which ſenſe it ſignifies no more than *example* and *ſimilitude.*

Again, the word αντιτυπος, in ſcripture, ſignifies any thing formed according to a model or pattern; and thus in the epiſtle to the Hebrews, the tabernacle, and holy of holies being made according to the pattern ſhewn to Moſes, are ſaid to be *antitypes* or figures of the true holy places.—In the like ſenſe, St. Peter ſpeaking of the flood and the ark, whereby eight perſons were ſaved, calls baptiſm an *antitype* thereto; by which he expreſſes no more than a ſimilitude of circumſtances.

The other words uſed in ſcripture to imply a future event, prefigured by ſome foregoing act, are—Ὑποδειγμα, rendered by *imitation* and *example*; and σκια, *ſhadow.*

This laſt word is frequently uſed by St. Paul, and applied to the Jewiſh law, ceremonies, prieſts, *&c.* which are repreſented as only ſhadows of things to come, or of heavenly things. It is from ſuch general expreſſions, that people were led to miſtake the apoſtle's deſign in theſe compariſons, and to aſſert, that all the Moſaic rites were *types* of, or deſigned to ſignify future events; and that the goſpel is to be found in the pentateuch.—Whereas St. Paul's intent appears no other than to ſhew the great advantage of the goſpel over the law in ſeveral particulars, wherein it has as much pre-eminence as the ſubſtance has over the ſhadow. See ACCOMMODATION.

If the ſhadow of things to come ſignify a prefiguration of future events, what are thoſe events to which the Jewiſh new moons, Col. ii. 16. or the Jewiſh meats and drinks, have a reſpect? Or, how did the law of Moſes, made of commands about perſons, times, places, and ſacrifices, prefigure a diſpenſation where regard to ſacrifices, holy perſons, times and places, are ſo far from being enjoined, that they are declared uſeleſs? Can a particular holy place in the law be deſigned a prefiguration of a ſtate where all places are equally holy?

Such being the import of all the terms uſed in the New Teſtament writers, ſeeming to imply any prefiguration of future events under the goſpel, we may obſerve,

1. That to argue from *types*, is only to argue from examples or ſimilitudes; and, conſequently, all inferences drawn from ſuch reaſonings, are no farther concluſive, than reaſonings from ſimilitudes are.—The intent of ſimilitudes is only to help to convey ſome ideas more clearly or ſtrongly; ſo that to deduce conſequences from a ſimile, or infer any thing from other parts of the ſimile than what are plainly ſimilar, is abſurd.

2. It cannot be proved that the ceremonies of the Moſaic law were ever deſigned to prefigure any future events in the ſtate of the Meſſiah's kingdom.—No ſuch declared prefigurations are mentioned in the writings of the Old Teſtament, whatever notions prevailed among the writers who immediately followed. It is granted, that the apoſtles argued from the rites in the Moſaic inſtitution; but it appears to have only been by way of illuſtration and analogy.

There is certainly a general likeneſs in all the diſpenſations of Providence: an analogy of things in the natural as well as the moral world, from which it is eaſy arguing by way of parity, and it is very juſt and uſual ſo to do: but that one of theſe diſpenſations was therefore given to preſignify another that was future, can never be proved, unleſs it be expreſly declared.—The Land of Promiſe, we know, was to be a place where the Jews were to enjoy reſt from their labours; God likewiſe did, himſelf, reſt the ſeventh day from his works: yet, who ever imagined God's reſt from the creation to be prefigurative of the Jews reſt in Canaan? and is it not equally reaſonable to ſay, that God's reſt on the ſeventh day, prefigured the entrance of the Jews into Canaan, as to ſay, that the Jews reſt in Canaan prefigured the reſt mentioned by David in the Pſalms?

This will equally imply, that all the following events in the uniform courſe of God's government, ſimilar to any preceding ones, were deſigned to be preſignified; in which ſenſe, it will readily be owned, that the reſt of the Jews was *typical* of the reſt of the Chriſtians.

It is in the ſame manner we are to underſtand St. Paul, where he ſays, "That Chriſt our paſſover is ſacrificed for us." And thus we are to underſtand John the Baptiſt, when he calls our Saviour the "Lamb of God."—There was this ſimilitude of circumſtance, that Chriſt was ſlain on the ſame day with the paſchal lamb; that he died about the ſame time of the day when the prieſts began their hillel; that not a bone of the one or the other was broken. Add, that as the paſchal lamb was without blemiſh, ſo was Chriſt without ſin.—From theſe, and other circumſtances, the apoſtle applied the term *paſſover* to Chriſt.

Thus, alſo, are we to account for what St. Paul calls the baptiſm of the children of Iſrael in the cloud, and in the ſea; and for the compariſon betwixt the high prieſt entering the holy place every year, and Chriſt entering into heaven. See QUOTATION.

TYPE,* ΤΥΠΟΣ, is alſo a name given to an edict of the emperor Conſtans II. publiſhed in 648, to impoſe a general ſilence both on the orthodox and the Monothelites. See MONOTHELITE.

* It had the name *type*, as being a kind of formulary of faith; or rather a form whereon men were to regulate their conduct.

The *type* owed its original to Paul, patriarch of Conſtantinople, who perſuaded that emperor to take away the ectheſis compiled and hung up in all the public places by Heraclius; (as occaſioning great complaints from the orthodox, by its favouring the Monothelites) and to publiſh an edict to impoſe ſilence on both parties, But ſuch kinds of pacifications are held inexcuſable in matters of religion; accordingly pope Theodore ſoon procured the patriarch Paul to be depoſed: the *type* was examined in the council of Rome in 649, and condemned; and an anathema pronounced againſt all ſuch as admitted either the impious ectheſis or *typus*. See Ecthesis.

Type, Typus, is alſo uſed to denote the order obſerved in the intenſion and remiſſion of fevers, pulſes, *&c.* See Fever, Pulse, *&c.*

TYPHODES, ΤΥΦΩΔΗΣ, in medicine, a kind of ardent or burning fever uſually attending on eryſipelas's of any of the viſcera. See Fever.

TYPHOMANIA,* ΤΥΦΟΜΑΝΙΑ, in medicine, a diſeaſe of the brain, wherein the patient not being able to ſleep, though greatly inclined thereto, lies with his eyes ſhut, talks abſurdly, and flings himſelf this way and that.

* The word is formed from the Greek, τυφος, *ſmoak*, and μανια, *madneſs*.

If he be pulled, or the like, he juſt opens his eyes, looks about, and ſinks again into a kind of dozing, which is interrupted by a train of diſagreeable imaginations.

The *typhomania* is a kind of combination of a phrenzy with a lethargy.—It is alſo called a *coma vigil*. See Coma, Phrenzy, and Lethargy.

TYPOGRAPHY,* the art of printing. See Printing.

* The word is formed from the Greek, τυπος, and γραφη, *ſcriptura, writing*.

TYRANT, Tyrannus, among the ancients, denoted ſimply a king, or monarch. See King, and Monarch.

But the ill uſe ſeveral perſons inveſted with that ſacred character, made of it, has altered the import of the word; and *tyrant* now carries with it the idea of an unjuſt and cruel prince, who invades the people's liberty, and rules in a more deſpotic manner than the laws of nature, or the country do allow of.

The term *tyrant*, we are told, became odious among the Greeks, thoſe zealous lovers of liberty, almoſt as ſoon as introduced: but Donatus aſſures us, it was never taken ſo among the Romans till the latter ages of that empire.

TYRIAN-*Purple*, } See the articles { Purple.
TYRO, } See the articles { Tyrocinium.

TYROCINIUM,* Tyrociny, a novitiate or apprenticeſhip in any art or ſcience. See Novice, and Novitiate.

* The word is formed of *tyro, a raw, freſh-water ſoldier*.

We have ſeveral writings under the title of *tyrociniums: tyrocinium chymicum, tyrocinium chirurgicum*, &c. containing the rudiments of thoſe arts, accommodated to the apprehenſions of the beginners.

TYROSIS,* ΤΥΡΩΣΙΣ, in medicine, a coagulating or curdling of milk in the ſtomach; after the manner of cheeſe. See Curdling, and Coagulation.

* The word is formed of the Greek, τυρος, *caſeus, cheeſe*. See Cheese.

TYTH, or rather Tithe. See the article Tithe.

TYTHING and Tything-*Man*. See Tithing, Decennier, Tenmentale, Hundred, Wapentake, *&c.*

U.

U, The twentieth letter in the alphabet, and the fifth vowel. See LETTER, and VOWEL.

Beſides the vowel *u*, there is a conſonant of the ſame denomination, wrote *v*, or v. See CONSONANT.

The pronunciation of the *u*, as now uſed among the Engliſh, French, *&c.* is borrowed from the antient Gauliſh: for all the other weſtern people, with the Romans, pronounce it *ou*.

V is alſo a numeral letter, and ſignifies *five*; according to the verſe,

V, *vero quinque dabit tibi, ſi recte numerabis.*

When a daſh was added atop, $\overline{\text{V}}$, it ſignified 5000.

V. R. among the Romans, ſtood for *uti rogas*, as you deſire: which was the mark of a vote, or ſuffrage for the paſſing of a law. See ROGATIO; ſee alſo A.

VACANCY, or VACUUM, in philoſophy, an empty interval, or ſpace void of matter. See VACUUM.

VACANCY, in law, *&c.* a poſt or benefice wanting a regular officer, or incumbent. See AVOIDANCE, *&c.*

The canoniſts hold, that the kind of *vacancy* is to be expreſſed in the impetration of a benefice. See BENEFICE.

A future *vacancy*, or voidance of a ſpiritual living, ſome writers call *vacatura.*—*Devolution* is a ſpecies of canonical *vacancy*. See DEVOLUTION.

VACANT *Effects*, *Prædia* VACATIA, or VACUA, are ſuch as are abandoned for want of an heir, after the death or flight of their former owner. See GOODS.

In our law-books, *vagantes terræ*, for *vacantes*, expreſſes forſaken, or uncultivated lands.

A benefice is ſaid to be *vacant in curia Romana*, when the incumbent dies in Rome, or within twenty leagues thereof; though it be only by accident that he was there.—The pope nominates to all benefices *vacant in curia Romana*, excepting thoſe of the neighbouring biſhopricks.

VACANT *Cylinder*, in gunnery. See the article CYLINDER.

VACATION, *Non-term*, in law, all the time included between the end of one term, and the beginning of the next ſucceeding one. See TERM.

This intermiſſion was called by our anceſtors *pax Dei*, and *eccleſiæ*; and ſometimes, the *time or days of the king's peace.* See PEACE.

Among the Romans, it was called *juſtitium*, or *feriæ*, or *dies nefaſti.* See DAY, NEFASTUS, FASTUS, FERIÆ, *&c.*

The time from the death of a biſhop, or other ſpiritual perſon, till the biſhoprick, or other dignity be ſupplied by another, is alſo called *vacation*. See PLENARTY.

Cicero, in his *Orations*, mentions a law, whereby the prieſts were exempted from ſervice in all wars, except only uproars, and civil tumults; which exemptions he calls *vacationes*.

VACUUM, VACUITY, in phyſics, a ſpace empty or devoid of all matter, or body. See SPACE, and MATTER.

Whether there be any ſuch thing in nature as an abſolute *vacuum*; or whether the univerſe be completely full, and there be an abſolute plenum; is a thing has been controverted by the philoſophers of all ages. See PLENUM.

The ancients, in their controverſies, diſtinguiſhed two kinds; a *vacuum coacervatum*, and a *vacuum interſperſum*, or *diſſeminatum.*

VACUUM *Coacervatum*, is conceived as a place deſtitute of matter: Such, *e. gr.* as there would be, ſhould God annihilate all the air, and other bodies within the walls of this chamber.

The exiſtence of ſuch a *vacuum* is maintained by the Pythagoreans, Epicureans, and the Atomiſts, or Corpuſcularians; moſt of whom aſſert ſuch a *vacuum* actually to exiſt without the limits of the ſenſible world.—But the modern Corpuſcularians, who hold a *vacuum coacervatum*, deny that application; as conceiving, that ſuch a *vacuum* muſt be infinite, eternal, and uncreated. See UNIVERSE.

According, then, to the later philoſophers, there is no *vacuum coacervatum* without the bounds of the ſenſible world; nor would there be any *vacuum*, provided God ſhould annihilate divers contiguous bodies, than what amounts to a mere privation, or nothing: the dimenſions of ſuch a ſpace, which the ancients held to be real, being by theſe held to be mere negations; that is, in ſuch a place, there is ſo much length, breadth, and depth wanting, as a body muſt have to fill it.—To ſuppoſe, that when all the matter in a chamber is annihilated, there ſhould yet be real dimenſions, is to ſuppoſe corporeal dimenſions without body; which is abſurd.

The Carteſians, however, deny any *vacuum coacervatum* at all; and aſſert, that if God ſhould immediately annihilate all the matter, *v. gr.* in this chamber, and prevent the ingreſs of any other matter, the conſequence would be, that the walls would become contiguous, and include no ſpace at all.—

They add, that if there be no matter in a chamber, the walls can be conceived no otherwiſe than as contiguous; thoſe things being ſaid to be contiguous, between which there is not any thing intermediate: but, if there be no body between, there is no extenſion between; extenſion and body being the ſame thing: and if there be no extenſion between, then the walls are contiguous; and where is the *vacuum?*

But the reaſoning is built on a miſtake, *viz.* that body and extenſion are the ſame thing. See EXTENSION, and SPACE.

VACUUM *Diſſeminatum*, or *Interſperſum*, is that ſuppoſed to be naturally interſperſed in, and among bodies, in the pores of the ſame body, and in the interſtices between different bodies. See PORE.

It is this kind of *vacuum* which is chiefly diſputed among the modern philoſophers: the Corpuſcularians ſtrenuouſly aſſerting it; and the Peripatetics, and Carteſians, as ſtiffly impugning it. See CORPUSCULAR, CARTESIAN, *&c.*

The great argument the Peripatetics urge againſt a *vacuum interſperſum*, is, that there are divers bodies frequently ſeen to move contrary to their own nature, and inclination; and for no other apparent reaſon, but to avoid a *vacuum:* whence they conclude, that nature abhors a *vacuum*; and give us a new claſs of motions aſcribed to the *fuga vacui*, or nature's flying a *vacuum*. See FUGA.

Such is the riſe of water in a ſyringe, upon the drawing up the piſton; ſuch alſo is the aſcent of water in pumps, the ſwelling of the fleſh in a cupping-glaſs, *&c.*

But ſince the weight, elaſticity, *&c.* of the air have been aſcertained by ſure experiments, thoſe motions and effects are univerſally aſcribed to the gravity, and preſſure of the atmoſphere. See AIR; ſee alſo SYRINGE, PUMP, CUPPING-*Glaſs*, &c.

The Carteſians deny not only the actual exiſtence, but even the poſſibility of a *vacuum:* and that on this principle, that extenſion being the eſſence of matter, or body, wherever extenſion is, there is matter: but mere ſpace, or vacuity, is ſuppoſed to be extended; therefore it is material.—Whoever aſſerts an empty ſpace, conceives dimenſions in that ſpace; *i. e.* conceives an extended ſubſtance in it; and therefore denies a *vacuum*, at the ſame time that he admits it.

On the other hand, the Corpuſcular authors prove, not only the poſſibility, but the actual exiſtence of a *vacuum*, from divers conſiderations; particularly from the conſideration of motion in general; and that of the planets, comets, *&c.* in particular; from the fall of bodies; from the vibration of pendulums; from rarefaction, and condenſation; from the different ſpecific gravities of bodies; and from the diviſibility of matter into parts.

1°. It is argued, that motion could not be effected without a *vacuum*. See MOTION.—This is what Lucretius urged long ago—*Principium quoniam cedendi nulla daret res—undique materies quoniam ſtipata fuiſſet.*

The force of this argument will be increaſed from the two following conſiderations, *viz.* firſt, that all motion is either in a ſtreight line, or in a curve which returns into itſelf, as the circle, and ellipſis; or in a curve that does not return into itſelf, as the parabola, *&c.* And, ſecondly, that the moving force muſt always be greater than the reſiſtance.

For, hence it follows, that no force, even though infinite, can produce motion where the reſiſtance is infinite; conſequently, there can be no motion either in a ſtreight line, or a non-returning curve; becauſe, in either of thoſe caſes, the protruſion, and conſequently the reſiſtance, would be infinite.—There remains, therefore, only the motion in a revolving curve practicable; which muſt either be a revolution upon an axis, or an annular motion round a quieſcent body; both which are, again, impoſſible in an elliptic curve: and conſequently, all motion muſt be in circles geometrically true; and the revolving bodies muſt either be ſpheres, ſpheroids, cylinders, or portions of them, exactly geometrical; otherwiſe, their revolutions in a plenum would be impoſſible: but ſuch motions, or ſuch figured bodies, we do not know in nature. Therefore there is a *vacuum*.

2°. The motions of the planets, and comets, demonſtrate a *vacuum:* thus Sir Iſaac Newton—" That there is no ſuch " fluid medium as æther, (to fill up the porous parts of all ſenſible bodies, as the air, and interſtellar parts, and ſo make a plenum) " ſeems probable; becauſe the planets and comets " proceed with ſo regular and laſting a motion, through " the celeſtial ſpaces, both from and to all parts: for " hence it appears, that thoſe celeſtial ſpaces are void of " all ſenſible reſiſtance, and conſequently of all ſenſible mat" ter. For the reſiſting force of fluid mediums, ariſes part" ly from the attrition of the parts of the medium, and " partly from the inactivity of matter.—Now, that part " of the reſiſtance of any medium, which ariſes from the

“ tenacity, or attrition of its parts, may be leſſened by dividing the matter into ſmaller parts, and by rendering thoſe parts more ſmooth and ſlippery: but that part of the reſiſtance which ariſes from the inactivity of matter, is always in proportion to the denſity of the matter; nor can be diminiſhed by dividing the matter, nor by any other means, except by diminiſhing the denſity thereof.

“ Conſequently, if the celeſtial regions were as denſe as water, or quickſilver, they would reſiſt almoſt as much as water or quickſilver; but if they were perfectly denſe, without any interſperſed vacuity, though the matter were ever ſo fluid and ſubtile, they would reſiſt more than quickſilver does; a perfect ſolid globe, in ſuch a medium, would loſe above half its motion, in moving three lengths of its diameter; and a globe not perfectly ſolid, ſuch as the bodies of the planets and comets are, would be ſtopped ſtill ſooner.—Therefore, that the motion of the planets and comets may be regular, and laſting, it is neceſſary the celeſtial ſpaces be void of all matter, except perhaps ſome few, and much rarified effluvia of the planets and comets, and the paſſing rays of light. See Resistance, Medium, Planet, Comet, &c.

3°. The ſame great author deduces a *vacuum* from the conſideration of the weights of bodies; thus: “ All bodies about the earth gravitate towards the earth; and the weights of all bodies, equally diſtant from the earth's centre, are as the quantities of matter in thoſe bodies.—If the æther, therefore, or any other ſubtile matter, were altogether deſtitute of gravity, or did gravitate leſs than in proportion to the quantity of its matter; becauſe (as Ariſtotle, Des Cartes, and others argue) it differs from other bodies only in the form of the matter; the ſame body might, by the change of its form, gradually be converted into a body of the ſame conſtitution with thoſe which gravitate moſt in proportion to the quantity of matter: and, on the other hand, the moſt heavy bodies might gradually loſe their gravity, by gradually changing their form: and therefore the weights would depend upon the forms of bodies, and might be changed with them; which is contrary to all experiment. See Weight.

4°. The deſcent of bodies proves that all ſpace is not equally full; for the ſame author goes on, “ If all ſpaces were equally full, the ſpecific gravity of that fluid, with which the region of the air would in that caſe be filled, would not be leſs than the ſpecific gravity of quickſilver or gold, or any other the moſt denſe body; and therefore neither gold, nor any other body, could deſcend therein.—For bodies do not deſcend in a fluid, unleſs that fluid be ſpecifically lighter than the body.—But by the air-pump, we can exhauſt a veſſel, till even a feather ſhall fall with a velocity equal to that of gold in the open air: the medium, therefore, through which the feather falls, muſt be much rarer than that through which the gold falls. See Descent.

“ The quantity of matter, therefore, in a given ſpace, may be diminiſhed by rarefaction: and why may not it be diminiſhed in infinitum? Add, that we conceive the ſolid particles of all bodies to be of the ſame denſity; and that they are only rarefiable by means of their pores: whence a *vacuum* evidently follows. See Rarefaction, Pores, and Particle.

5°. “ That there is a *vacuum*, is evident from the vibrations of pendulums: for ſince thoſe bodies in places out of which the air is exhauſted, meet with no reſiſtance to retard their motion, or ſhorten their vibrations; it is evident there is no ſenſible matter in thoſe ſpaces, or in the occult pores of thoſe bodies. See Pendulum.

For, as to what Des Cartes urges of his materia ſubtilis, that its tenuity prevents its reſiſtance from being ſenſible, and that a ſmall body ſtriking againſt a greater, cannot in the leaſt move, or reſiſt the motion of that other; but is reflected back again with all its momentum: it is contrary to all experience. For Sir Iſaac proves, that the denſity of fluid mediums, is proportionable to their reſiſtances, very nearly; and that they are exceedingly miſtaken, who ſuppoſe the reſiſtance of projectiles to be infinitely diminiſhed, by dividing the parts of the fluid, even in infinitum. (*Princip.* Lib. II. Prop. 38.) When, on the contrary, it is clear the reſiſtance is but little diminiſhed by the ſubdiviſion of the parts; (*ibid.* Prop. 40.) and that the reſiſting forces of all fluids are nearly as their denſities.—For why ſhould not the ſame quantity of matter, whether divided into a great number of ſubtile parts, or into a few larger ones, have the ſame reſiſting force? If then there were no *vacuum*, it would follow, that a projectile moving in the air, or even in a ſpace whence the air is exhauſted, ſhould move with as much difficulty as in quickſilver; which is contrary to experience. See Projectile.

6°. That there are interſperſed vacuities, appears from matter's being actually divided into parts, and from the figures of thoſe parts: for, on ſuppoſition of an abſolute plenitude, we do not conceive how any part of matter could be actually divided from that next adjoining, any more than it is poſſible to divide actually the parts of abſolute ſpace from one another: for by the actual diviſion of the parts of a continuum from one another, we conceive nothing elſe underſtood, but the placing thoſe parts at a diſtance from one another, which, in the continuum, were at no diſtance from one another: but ſuch diviſions between the parts of matter, muſt imply vacuities between. See Divisibility.

7°. As for the figures of the parts of bodies, upon the ſuppoſition of a plenum, they muſt either be all rectilinear, or all concavo-convex; otherwiſe, they would not adequately fill ſpace; which we do not find to be true in fact.

8°. The denying a *vacuum*, ſuppoſes what it is impoſſible for any one to prove to be true; *viz.* that the material world has no limits. See Universe.

Since then the eſſence of matter does not conſiſt in extenſion, but in ſolidity, or impenetrability, the univerſe may be ſaid to conſiſt of ſolid bodies moving in a *vacuum:* nor need we at all fear, leſt the phenomena of nature, moſt of which are plauſibly accounted for from a plenitude, ſhould become inexplicable when the plenum is ſet aſide.—The principal ones, ſuch as the tides; the ſuſpenſion of the mercury in the barometer; the motion of the heavenly bodies, of light, &c. are more eaſily and ſatisfactorily accounted for from other principles. See Tides, &c.

Vacuum, or *Vacuum Boyleanum*, is alſo uſed, ſomewhat abuſively, to expreſs that approach to a real *vacuum*, which we arrive at by means of the air-pump. See Air-*Pump*.

Thus, any thing put in a receiver ſo exhauſted, is ſaid to be put *in vacuo:* and thus, moſt of the experiments with the air-pump, are performed *in vacuo*, or *in vacuo Boyleano*.

Some of the principal phenomena obſerved of bodies *in vacuo*, are; that the heavieſt and lighteſt bodies, as a guinea and a feather, fall here with equal velocity:—That fruits, as grapes, cherries, peaches, apples, &c. kept for any time *in vacuo*, retain their nature, freſhneſs, colour, &c. and thoſe withered in the open air, recover their plumpneſs *in vacuo:*—All light, and fire becomes immediately extinct *in vacuo:*—The coalition of flint and ſteel *in vacuo*, produces no ſparks:—No ſound is heard, even from a bell rung *in vacuo:*—A ſquare viol, full of common air, well cloſed, breaks *in vacuo*; a round one does not:—A bladder half full of air, will heave up forty pound weight *in vacuo:*—Cats, and moſt other animals, readily expire *in vacuo*.

By experiments made in 1704, Mr. Derham found, that animals which have two ventricles, and no foramen ovale, as birds, dogs, cats, mice, &c. die in leſs than half a minute; counting from the firſt exſuction: a mole died in one minute, a bat lived ſeven or eight.—Inſects, as waſps, bees, graſhoppers, &c. ſeemed dead in two minutes; but, being left *in vacuo* twenty four hours, came to life again in the open air: ſnails continued twenty four hours *in vacuo*, without appearing much concerned.

Seeds planted *in vacuo* do not grow:—Small bear dies, and loſes all its taſte *in vacuo:*—Lukewarm water boils very vehemently *in vacuo:*—Air, ruſhing through mercury into a *vacuum*, throws the mercury in a kind of ſhower upon the receiver, and produces a great light in a dark room. See Attrition, &c.

The air-pump can never produce a preciſe *vacuum*; as is evident from its ſtructure, and the manner of its working: in effect, every exſuction only takes a part of the air: ſo that there will ſtill be ſome left after any finite number of exſuctions.—Add that the air-pump has no longer any effect, than while the ſpring of the air remaining in the receiver, is able to lift up the valves: when the rarefaction is come to that degree, you can come no nearer to a *vacuum*. Sir Iſaac Newton, obſerving that a thermometer ſuſpended *in vacuo*, and in that ſtate removed to a warm or a cold room, receives the heat or cold, riſes, or falls, almoſt as ſoon as another in open air; takes thence occaſion to ſuſpect, that the heat of the warm room is conveyed through the *vacuum*, by the vibrations, of a much ſubtiler medium than air, which remained in the *vacuum* after the air was drawn out. (*Opt.* p. 323.) See Medium, Heat, &c.

VADARI, in the civil law, denotes a perſon to pledge, undertake, or give ſecurity in behalf of another; that he ſhall, on a certain day, appear in court, to proſecute, or anſwer. See Vouch, and Appearance.

If he fails, his ſurety has an action *vadimonii deſerti* againſt him; that is, an action for deſerting his bail. See Vadimonium, Bail, Default, &c.

Properly ſpeaking, *vadari reum*, among the Romans, was the act of the plaintiff himſelf, who here demanded ſurety, or bail from the defendant, that he would appear before the prætor on a certain day.

VADELECT. See the article Valect.

VADE-MECUM, or a Veni-mecum, a Latin phraſe, uſed in Engliſh, to expreſs a thing that is very handy, and familiar; and which one uſually carries about with him: chiefly applied to ſome favourite book.

Some make Virgil, others Horace, their *vade-mecum*; others an Epictetus, others a Thomas à Kempis, &c.

This is what the Greeks call εγχειριδιον, or *manual.*—The Arabs have a phraſe of equal import; *viz. Habib al ſeir, comes itineris*, friend of the journey.—In Latin it is beſt expreſſed by *comes*; as *comes theologicus, comes ruſticus*, &c.

VADIMONIUM, in the civil law, a promiſe, or bond, given for appearance before the judge upon a day appointed. See VADARI.

VADIUM. See the article PONE *per Vadium.*

VAGABOND,* a perſon that wanders about, having no certain dwelling; or a ſturdy beggar, &c. mentioned in divers ſtatutes.

* *De* vagabundis & *aliis hominibus mendicantibus qui ſe nominant.*—Travelling men, &c. Charta 22 Hen. VI.—*Item utemur quod nullus vagabundus vagetur ſeu deambulet de nocte in villa ſeu ſuburbio poſt pulſationem campanæ noſtræ communis, vocatæ Coverfeu, & ſi aliquis ibidem capiatur poſt pulſationem dictæ campanæ, ducatur ad Gaulam domini regis, & ibi morabitur uſque in craſtinum ut notitia perſonæ ſuæ habeatur*, &c. MS. Cod. de Leg. & Stat. Burgi villæ Mountgomer. Temp. Hen. II.

All itinerant beggars, fortune-tellers, collectors for goods, fencers, bearwards, players of interludes, minſtrels, jugglers, gypſies, &c. ſhall be reputed *vagabonds*, rogues and ſturdy beggars, 39 *Eliz. c.* 4. See ROGUE, &c.

VAGINA, a Latin term, literally ſignifying a *ſheath*, or *ſcabbard*; uſed on divers occaſions.—As,

VAGINA, in architecture, is uſed for the lower part of a terminus; becauſe reſembling a ſheath, out of which the ſtatue ſeems to iſſue. See TERMES.

The *vagina* is that long part between the baſe, and the capital; and is formed in divers manners, and with divers ornaments.

VAGINA, in anatomy, denotes a canal, or cavity, leading from the pudendum, to the uterus of women. See GENERATION.

The *vagina*, called alſo *cervix uteri*, is a membranous paſſage, extended from the rima, or aperture of the labia, to the neck of the womb.—See *Tab. Anat. (Splanch.) fig.* 9. *lit. h. fig.* 11. *lit. a.* See the article CERVIX.

It lies upon the rectum, to which it finally adheres; and under the urinary bladder: its length is ordinarily ſeven or eight inches.

Its inward ſubſtance is nervous, and exquiſitely ſenſible; the outer membranous, and looſe: at its orifice it is much narrower than elſewhere; eſpecially in virgins.

Through its whole courſe it is full of rugæ, or wrinkles; eſpecially in the upper internal ſurface; which rugæ the uſe of venery renders leſs apparent, and frequent parturition almoſt obliterates: which ſhews, that they were intended, to render the part more eaſily diſtendible for parturition.

Along the whole tract of the *vagina* are pores, or oſtia, or little ducts ſeen, which, in the act of venery, emit a liquor that has been by many miſtaken for ſeed. See SEED.

The *vagina* has a conſtrictory muſcle, inſerted under the clitoris; which, with a broad ſeries of fibres, embraces and conſtringes the lower part of the *vagina*, and puts the dimenſion of the part, in ſome meaſure, in the power of the mind. See MATRIX.

VAGINÆ *Uteri Sphincter.* See SPHINCTER *Vaginæ*, &c.

VAGINALIS *Gulæ*, in anatomy, a name ſome anatomiſts give to the muſculous coat of the gula; as ſuppoſing it a proper muſcle, conſpiring with the œſophagæus in thruſting the aliment down, when entered. See OESOPHAGÆUS, DEGLUTITION, &c.

VAGINALIS *Tunica*, the ſame with what we otherwiſe call *elythroides.* See ELYTROIDES.

VAGUM, in anatomy, a name given to the eighth pair of nerves of the medulla oblongata, called the *par vagum*, becauſe diſpended to divers parts of the body.—See *Tab. Anat. (Oſteol.) fig.* 5. *lit. q. q.* See alſo the article NERVE.

VAIR, in heraldry, a kind of fur, or doubling, conſiſting of divers little pieces, argent and azure, reſembling a Dutch U, or a bell-glaſs. See VAIRY.

Vairs have their point azure, oppoſite to their point argent, and the baſe argent to the azure.

When there are only two or three *vairs*, the antient heralds call it *great vair*; and when there are more, *ſmall vair.*

Vair is intended to repreſent a kind of ſkin, uſed antiently by the kings of France, in lieu of a fur, and wherewith the gowns of the preſidents a mortier, the counſellors of the court, the heralds coats, &c. were lined, till the fifteenth century.

It was properly the ſkin of a kind of ſquirrel, called alſo, in French, *vair*, and in Latin, *ſcriveus*; which was white underneath, and dove-colour a-top. It is deſcribed by Aldrovandus, under the name of *ſcriveo varia*, and is the ſame, according to Geſner, with the *mus ponticus* of Ariſtotle and Pliny; which the Latins call *varus*, or *varius*, from the variety of its colour.—Its two ſkins joined together, make the figure of the *vairs* in armories; being naturally white and azure.

Vair, Colombiere obſerves is the ſecond ſort of fur, antiently uſed as a lining of the garments of great men; conſiſting of little pieces, ſewed by the furriers on white ſkins: and becauſe theſe pieces were uſually blue, thoſe who firſt ſettled the rules of heraldry, decreed, that this fur, in its natural blazon, ſhould always be argent and azure.—So if it be abſolutely ſaid, ſuch a family bears *vair*; it is ſuppoſed to be argent and azure.

Regularly, there muſt be but four rows or ranks of *vair* in the ſhield; if there be either more, or leſs, the number muſt be ſpecified.—The ſmalleſt number, being three rows, is called *beffroy de vair*; and the moſt, being five or ſix, is called *menu*, or *ſmall vair.*

The *beffroy* is alſo known by the firſt figure on the dexter-ſide of the eſcutcheon, being always of metal, and in form of a belt; whereas that of mere *vair* is in ſhape of a glaſs.

VAIRY, VAIRE', VERRY, or VARRY, is applied to a coat, or the bearings of a coat, when charged, or chequered, with *vair.* See VAIR.

When the colours are argent and azure, or white and blue, it is *very proper*: if it be otherwiſe, the colours are to be expreſly named; *vairy* of ſuch a colour or metal.—He bears *vairy* or, and vert: this is particularly called *vair compoſed.*

The bearings are likewiſe ſaid to be *vairy*, when they are charged with *vairs.*—When chiefs, croſſes, pales, feſſes, &c. happen to be *vairy*, the number of ranks are to be ſpecified.

Vairy gowns are obſerved, by Julius Pollux, to have been the habit of the antient Gauls, as ermins were of the Armenians. See ERMIN.

VAIRY *Cuppy*, or VAIRY *Taſſy*, or *Potent counterpotent*, is a bearing in heraldry, compoſed of pieces repreſenting the tops of crutches.—See *Tab. Herald. fig.* 87. See alſo the article COUNTERPOTENT.

In blazon, the colours muſt be expreſſed; as azure, argent, &c.

VALDENSES. See the article VAUDOIS.

VALECT, or VADALECT. See the article VALET.

VALENTIAM. See the article CAPE *ad Valentiam.*

VALENTINIANS, an antient and famous ſect of Gnoſtics; thus called from their leader *Valentinian.* See GNOSTIC.

VALERE. See the article PERINDE *Valere.*

VALERIAN, VALERIANA, a plant, whoſe root is of conſiderable uſe in medicine; thus called, according to ſome, from one *Valerius*, who firſt brought it into uſe; according to others, from *valere*, to be of great virtue.

There are various kinds of *valerian*; but thoſe chiefly in uſe, are the larger garden *valerian, valeriana hortenſis*; called by Dioſcorides, *phu, folio oluſatri*,—and the *valeriana ſylveſtris*, or great wild *valerian.*

The former is an ingredient in Venice treacle: its chief uſe is in diſorders of the nerves: in which reſpect, however, it is held inferior to the latter.

The *wild valerian* is warm, and aromatic, but ſomewhat of a fetid ſcent: its efficacy, as a ſudorific, is ſupported by the teſtimony of both antient and modern practice.—It has been reckoned by ſome deterſive, ſo much as to make it diuretic, and good in all obſtructions of the viſcera.—It is extolled alſo for ſtrengthening the optic nerves, and reſtoring decayed ſight; but the preſent practice acknowledges it not in any ſuch intentions.—It ſometimes does wonders in hyſterical affections; eſpecially where things of the fetid kind are good, and the ſpirits are too impetuous in their motions, ſo as to occaſion convulſions.—It is alſo aſſiſted with camphire, and ſome other things of the like nature, which are very powerful in breaking through the minuteſt obſtructions, to cure obſtinate agues.—It is efficacious in all nervous caſes; and particularly the epilepſy: which virtue in it ſeems to have been firſt diſcovered by Fabius Columna, who preſcribed it for that purpoſe in powder.

M. Merchant, in the *Memoirs of the Academy of Sciences*, has confirmed this virtue, by many inſtances within his knowledge: and what is very remarkable, is, that in the two obſervations he enlarges moſt upon, the patients voided great quantities of worms.—His cuſtom was, always to purge before he adminiſtred it.

VALESIANS, VALESIANI, ancient ſectaries, ſo called from one *Valeſius*, a perſon unknown to Epiphanius, who makes mention of this ſect, *Hær.* 58. though he owns we know but very little of them; only this, that they admitted none into their ſociety but eunuchs; at leaſt, if any were admitted before caſtration, they obliged them not to eat any meat till the operation was performed.—For then, being no longer ſubjects to the motions of the fleſh, they allowed them to eat any kind of meats. See EUNUCH, &c.

VALET, or VALECT, a French term, antiently wrote *valet.*

In France, *valet* is a common name for all domeſtic ſervants, employed in the lower and more ſervile offices; including what we call *grooms, footmen, coachmen, bailiffs*, &c. But the word is not uſed among us in this ſenſe, nor any otherwiſe than in the phraſe *valet de chambre*; which is a ſervant, whoſe office is to dreſs, and undreſs his maſter, to look to his bed-chamber, wait on him at table, *&c.* the ſame with what we otherwiſe call a *gentleman.*

In the hiſtory of Lewis XII. by Seiſel, we always find *varlet de chambre du roi*, *varlet de la gardrobe*, &c. But *varlet*, like *knave*, and divers other words, is now degenerated into a word of reproach.

Valet, *valect*, *vadalect*, *vadlet*, and *vallet*, Camden obſerves, were antiently uſed at our court, for a gentleman of the privy-chamber.

Selden, in his *Titles*, relates, that *valets* antiently ſignified young gentlemen, and heirs of great eſtate and quality; eſpecially ſuch as were to be knighted.

In the accounts of the Inner-temple, *valet* is uſed for a bencher's clerk, or ſervant.—The butlers of the houſe ſtill call them *varlets.*

VALETUDINARY, VALETUDINARIUS, a term ſometimes uſed by the writers of medicine, for a perſon of a weak, ſickly conſtitution, frequently out of order, *&c.*

Dr. Cheyne, by all means, directs the weakly, the ſtudious, the ſedentary, and the *valetudinary*, to a low, ſpare regimen. See FOOD, EXERCISE, DIET, *&c.*

VALID, a term applied to acts, tranſactions, expeditions, *&c.* which are cloathed in all the formalities requiſite to their being put into execution, and to their being admitted in a court of juſtice. See NULLITY.

A contract by a minor is not *valid*, or is *invalid:* a marriage is not *valid*, unleſs performed with the ſolemnities enjoined.

VALLAR,* VALLARIS, in antiquity, an epithet given to a kind of crown, which the Roman generals beſtowed on him who, in attacking the enemies camp, firſt broke in upon the lines, or paliſades. See CROWN.

* The word is formed from *vallum*, a ſtake with branches, whereof he made the paliſade of a camp, called *lorica.*

The *corona vallaris* was the ſame with what was otherwiſe called *corona caſtrenſis*, from *caſtra*, *a camp.*—Aulus Gellius aſſures us, that it was of gold, as the mural and naval crowns were: yet, though they were made of that precious metal, they were not the moſt valued: for Pliny, lib. xxii. cap. 3. gives the preference to the corona obſidionalis, which yet was only of gramen, or graſs.

VALLEY, VALE, in geography. See MOUNTAIN.

VALORE *Maritagii*, VALUE *of marriage*, a writ which antiently lay for the lord, after having proffered ſuitable marriage to an infant who refuſed the ſame; to recover the value of the marriage. See MARRIAGE.

VALVASOR, or VALVASOUR. See VAVASOR.

VALUE, VALOR, in commerce, the price or worth of any thing.

Intrinſic VALUE, denotes the proper, real, and effective worth of any thing: and is uſed chiefly with regard to money; the popular *value* whereof may be raiſed, and lowered at the pleaſure of the prince; but its real, or *intrinſic value*, depending wholly on its weight and fineneſs, is not at all affected by the ſtamp, or impreſſion thereon. See MONEY, COIN, *&c.*

It is generally on the foot of this *intrinſic value*, that ſpecies are received in foreign countries; though in the places where they are coined, and where the ſovereign power makes them current, they generally paſs for much more. See PAR.

It is, in good meaſure, on the difference of thoſe two *values*, one whereof is, as it were, arbitrary, and the other, in ſome ſort, natural; that the difference of exchanges depends: and thoſe ſtill riſing and falling, as the rate at which a ſpecies is current, comes nearer or farther off the juſt price of the metal whereof it conſiſts. See EXCHANGE.

VALUE, in bills of exchange, is uſed to ſignify the nature of the thing, (as ready money, merchandizes, bills, debts, *&c.*) which is given, as it were, in exchange from the ſum ſpecified in the bill. See BILL.

From four different manners of expreſſing this *value*, ſome diſtinguiſhed four kinds of bills of exchange.—The firſt bears *value received*, ſimply and purely, which comprehends all kinds of *value*; the ſecond, *value received in money*, or *merchandize*; the third, *value of myſelf*; and the fourth, *value* underſtood.

The firſt is dangerous, and the fourth but little uſed: accordingly, to have the *value* well expreſſed, and to prevent the ill conſequences of overſights therein, it is well provided by the French ordonnance of 1673, that bills of exchange ſhall contain the name of the perſon to whom the contained ſum is to be paid; the time of payment; the name of him who has given the *value*; and whether it was received in money, merchandize, or other effects. See BILL *of exchange.*

VALUE, VALOR, or VALENTIA, in law.—Weſt gives us a nice difference between *value*, and *price*; the *value* (ſays he) of things in which offences are committed, is uſually compriſed in indictments; which ſeems neceſſary in theft, to make a difference from petty larceny; and in treſpaſs, to aggravate the fault, and increaſe the fine. See THEFT, LARCENY, *&c.*

But no price of things *feræ naturæ* may be expreſſed, as of deers, hares, *&c.* if they be not in parks and warrens.—And where the number of things taken is to be expreſſed in the indictment, as of young doves in a dove-houſe, there muſt be ſaid *pretii*, or *ad valentiam:* but of divers dead things, *ad valentiam*, and not *pretii:* of coin not current it ſhall be ſaid *pretii*; but of coin current, neither *pretii*, nor *ad valentiam*; the price and *value* being certain.

VALVE,* VALVULA, in hydraulics, pneumatics, *&c.* is a kind of lid, or cover of a tube, or veſſel, ſo contrived, as to open one way; but which, the more forcibly it is preſſed the other way, the cloſer it ſhuts the aperture: ſo that it either admits the entrance of a fluid into the tube, or veſſel, and prevents its return; or admits it to eſcape, and prevents its re-entrance.

* The word is formed from the Latin, *valvæ*, *folding doors.*

Valves are of great uſe in the air-pump, and other wind-engines; in which they are ordinarily made of pieces of bladder. See AIR-*Pump*, and WIND-*Gun.*

In hydraulic engines, as the emboli of pumps, they are frequently of leather; their figure round, and are fitted to the bottoms, or other parts of the barrel, *&c.* to ſhut the aperture. See EMBOLUS.

Sometimes they are made of two round pieces of leather, incloſed between two others of braſs; having divers perforations, which are covered with another piece of braſs, moveable upwards and downwards, on a kind of axis, which goes through the middle of them all.

Sometimes they are made of braſs, covered over with leather, and furniſhed with a fine ſpring, which gives way upon a force applied againſt it: but upon the ceaſing of that, returns the *valve* over the aperture. See PUMP, *&c.*

VALVE, VALVULA, in anatomy, a thin membrane, applied, like a door or ſhutter, on divers cavities and veſſels of the body; to afford a paſſage to ſome humour, or other matter, going one way, and prevent its reflux towards the part whence it came. See VESSEL, *&c.*

The veins and lymphatics have *valves*, ſituate from ſpace to ſpace, which open towards the heart, but keep cloſe on that ſide towards the extremities, *i. e.* they let the blood and lymph paſs towards the heart, but prevent their returning to the extreme parts, whence they came. See VEIN, and BLOOD.

The heart has alſo its *valves*, placed at the entrance of the veſſels ariſing out of it.—Thoſe at the entrance of the vena cava, and pulmonary vein, let the blood paſs on to the heart, and prevent its return: on the contrary, thoſe at the entrance of the aorta, and pulmonary artery, let the blood paſs out of the heart, and prevent its flowing back again.—See *Tab. Anat.* *(Angeiol.) fig.* 1. *lit. A.* See alſo HEART, CIRCULATION, CAVA, *&c.*

" In the jejunum, and ileum, the inner tunic being larger " than the outer, is much corrugated; the looſe folds of " which have been thought, in ſome meaſure, to do the of- " fice of *valves*; and have therefore been called *valvulæ* " *conniventes.*" Drake, *Anat.* p. 49.

" The lacteals, opening into the inteſtines, receive the pre- " pared fluid part of the chyle; and appear at intervals, as it " were, girt and ſtraightened; and when preſſed, do not ad- " mit of a reflux towards the inteſtines; though the liquor " be eaſily propelled towards the glands: which argues, that " there are *valves* in them, though too minute to be ſenſible " to the eye." *Id. ibid.* p. 56.

The colon has a thick *valve*, to prevent the excrements from paſſing into the ileon; and ſeveral other *valves*, to retard the deſcent of the excrements. See COLON, and EXCREMENT.

Conſtantine Varolius, a Boulogneſe, and phyſician of Gregory XIII. who died in 1570, was the firſt that obſerved the *valve* in the colon.—Bart. Euſtachio, a native of San Severino in Italy, diſcovered, about the ſame time, the *valve* at the orifice of the coronary vein; and that remarkable one at the orifice of the lower trunk of the vena cava, near the right auricle of the heart: though he did not take it for a *valve*, but merely for a membrane.

Sig. Lanciſi, phyſician to the late pope, who firſt publiſhed Euſtachio's works, takes the uſe of this *valve* to be to prevent the blood of the upper vena cava from ſtriking with too much violence againſt that of the lower: and M. Winſlow, who, has conſidered it very diligently in the *Memoirs of the Royal Academy of Sciences*, is much of the ſame opinion.

But as it gradually dwindles in children, and at length becomes quite loſt in adults, ſtill diminiſhing as the foramen ovale does; it ſhould ſeem to have ſome other office; and that, chiefly, regarding the circulation of the blood in the fœtus.

In effect, by means hereof, M. Winſlow reconciles the two oppoſite ſyſtems of the circulation of the blood in the fœtus, delivered under the article *circulation.* See CIRCULATION *of the Blood*, and FOETUS.

Great VALVE, *Valvula major*, is the upper part, and, as it were, the lid of the iſthmus between the teſtes, and the firſt vermicular proceſs of the cerebellum: its ſubſtance is medullary.—Its uſe is to prevent the lymph from falling on the nerves at the baſe of the cranium.

VAN, Vant, or Vaunt, (of the French *avant*, or *avaunt*, before) is a term uſed in compoſition with ſeveral words in our language.—As,

Van-Couriers, are light-armed ſoldiers, ſent before to beat the road, upon the approach of an enemy. See Reconnoitre.

Van-Fosse, a ditch dug without the counterſcarp, and running all along the glacis; uſually full of water. See Ditch.

Van, or Vant, or Vaunt-*Corps*. See Corps.

Van, or Van-Guard, is a military term, ſignifying the firſt line of an army, drawn up in battalia. See Line, and Army.

It is the ſame with the *front* of an army, and gives the firſt charge upon an enemy. See Front.

Every army is compoſed of three parts, a *van-guard*, *rear-guard*, and *main body*. See Guard.

Van-*Lay*. See the article Vaunt.

VANEERING. See the article Veneering.

VANES, on mathematical inſtruments, are ſights made to move and ſlide upon croſs-ſtaves, fore-ſtaves, Davis's quadrants, *&c.* See Cross-staff, Fore-staff, *&c.*

Vanes, or Fanes *of Feathers.*	See	Feather.
Weather Vanes.		Weather.
Vanes *of Windmills.*		Windmill.

VANILLA, or Vanella, a little black ſeed, growing in longiſh pods; uſed in the Weſt-Indies, France, Spain, *&c.* as a principal ingredient in the compoſition of chocolate; to give it ſtrength, and an agreeable flavour. See Chocolate.

It is alſo uſed to perfume tobacco and ſnuff withal. See Tobacco.

It is ſuppoſed to ſtrengthen the brain, and ſtomach; to attenuate viſcid humours, provoke urine, and the menſes.

Vant, or Vaunt. See the article Van.

VAPORARIUM, or Vaporosum *Balneum*, *Vapour-bath*, in chymiſtry, a term applied to a chymiſt's bath, or heat, wherein a body is placed, ſo as to receive the fumes of boiling water. See Bath.

The *balneum vaporoſum* conſiſts of two veſſels, diſpoſed over one another in ſuch manner, as that the vapour raiſed from the water contained in the lower, heats the matter incloſed in the upper. See Heat.

The *vapour-bath* is very commodious for the diſtilling of odoriferous waters, and the drawing of ſpirit of wine.

We alſo uſe the term *vapour-bath*, when a ſick perſon is made to receive the vapours ariſing from ſome liquid matter placed over a fire. See Bath, Fumigation, *&c.*

VAPORATION, Vaporatio, in chymiſtry, a term applied to the action of fume, or vapour. See Vapour.

Vaporation, is a kind of bathing, or rather fomentation, whereby the warmth, or humidity of a vapour is made to act on ſome other body, that is to be warmed, or moiſtened. See Bath, and Heat.

VAPOROSUM *Balneum*. See the article Vaporarium.

VAPOUR, Vapor, in meteorology, a thin veſicle of water or other humid matter, filled or inflated with air; which being rarefied to a certain degree by the action of heat, aſcends to a certain heighth in the atmoſphere, where it is ſuſpended, till it return in form of rain, ſnow, or the like. See Rain, and Snow.

An aſſemblage of a number of particles, or veſicles of *vapour*, conſtitutes what we call a *cloud*. See Cloud.

Some uſe the term *vapour*, indifferently, for all fumes emitted, either from moiſt bodies, as fluids of any kind; or from dry bodies, as ſulphur, *&c.*—But Sir Iſaac Newton, and other authors, better diſtinguiſh between humid and dry fumes, calling the latter *exhalations*. See Exhalation.

For the manner wherein Vapours *are raiſed, and again precipitated*, ſee Dew, Rain, Heat, Cold, and Barometer.—*For the effect of* Vapour *in the formation of ſprings*, &c. ſee Spring, and River.

The quantity of *vapour* raiſed from the ſea by the warmth of the ſun, is far greater than one would imagine.—Dr. Halley has attempted to eſtimate it.

In an experiment made with that view, and deſcribed in the *Philoſophical Tranſactions*, he found that a quantity of water, no warmer than air in ſummer, loſt in *vapour*, in the ſpace of two hours, no leſs than one fifty-third part of an inch in depth: now, for one fifty-third part in two hours, taking, for the eaſier calculation, one ſixtieth part, in the twelve hours that the ſun is up each day, it will raiſe one tenth of an inch from the ſurface of the ſea.

On this ſuppoſition, every 10 ſquare inches of the ſurface of water, yield in *vapour*, per diem, a cubic inch of water; and each ſquare foot, half a wine pint; every ſpace of four foot ſquare, a gallon; a mile ſquare, 6914 tuns; a ſquare degree, ſuppoſed of 69 Engliſh miles, will evaporate 33 millions of tuns: and if the Mediterranean be eſtimated at 40 degrees long, and four broad, allowances being made for the places where it is broader, by thoſe where it is narrower, there will be 160 ſquare degrees at ſea: and conſequently the whole Mediterranean muſt loſe in *vapour*, in a ſummer's day, at leaſt, 5280 millions of tuns.

And this quantity of *vapour*, though very great, is only the remains of another cauſe, which cannot be reduced to rule; we mean the winds; whereby the ſurface of the water is licked up, ſometimes faſter than it exhales by the heat of the ſun; as is well known to thoſe that have conſidered thoſe drying winds. See Evaporation.

Vapour-*Bath*. See Vaporarium, and Bath.

VAPOURS, in medicine, a diſeaſe popularly called *hypo*, or the *hypochondriacal* diſeaſe; and in men particularly, the *ſpleen*. See Spleen.

It is ſuppoſed to be owing to a ſubtile *vapour*, riſing from the lower parts of the abdomen, particularly the hypochondria, to the brain; which it diſturbs, and poſſeſſes with wild delirious, but generally diſagreeable imaginations. See Hypochondriacal *Diſeaſe*.

Vapours, ſuppoſed to be emitted from the womb, in women, are what we otherwiſe call *hyſterical affections*, or *ſuffocations*, or *fits of the mother*. See Hysterical, *&c.*

VARI, in medicine, little, hard, ruddy tumours, whitiſh about the tips, and of the ſize of an hempſeed; frequently found on the face and neck of young people; chiefly ſuch as are much addicted to venery.

If the red be very lively, the cure is ſomewhat difficult; and though the puſtules be taken away, the redneſs remains.—To which, if an inflammation and hoarſeneſs be added, it is a ſymptom of an approaching leproſy. See Leprosy.

VARIABLE, in geometry and analytics, is a term applied by mathematicians, to ſuch quantities as either increaſe, or diminiſh, according as ſome other quantity either increaſes, or diminiſhes.

Thus, the ſemiordinates, and abſciſſes of an ellipſis, *&c.* are *variable quantities*; becauſe, if the one increaſe, the other increaſes likewiſe. See Semiordinate, *&c.*

They are thus called, in contradiſtinction to *conſtant*, or *given*, or *ſtable quantities*; which are always the ſame, though others change: as the ſemidiameter of a circle, which remains the ſame, though the abſciſſes and ſemiordinates increaſe.

Variable quantities, are uſually denoted by the laſt letters of the alphabet, *x*, *y*, *z*. See Quantity, Character, *&c.*

Some authors, inſtead of *variable*, and *conſtant* quantities, uſe the terms *fluent*, and *ſtable* quantities.

The infinitely ſmall quantity whereby a *variable* quantity is continually increaſing, or diminiſhing, is called the *fluxion*, or *difference*; the calculation whereof, is the ſubject of the new *methodus differentialis*, or *doctrine of fluxions*. See Differential, and Fluxion.

Variable *Winds*. See the article Wind.

VARIANCE, Variantia, in law, an alteration or change of condition in a perſon, or thing; after ſome former concern, or tranſaction therewith.

Thus, if the commonalty of a town make a compoſition with a lord, and afterwards bailiffs be granted by the king to the ſame town; there, if the lord commence any ſuit for breach of the compoſition, he muſt *vary* from the word *commonalty*, uſed in the compoſition; and uſe *bailiffs and commonalty*.

Variance is alſo uſed for an alteration of ſomething formerly laid in a plea; or where the declaration in a cauſe differs from the writ, or from the deed upon which it is grounded. See Plea, Declaration, *&c.*

VARIATION, in geography, navigation, *&c.* a term applied to the deviation of the magnetical needle, or compaſs, from the true north point, towards either eaſt, or weſt; called alſo the *declination*. See Declination.

The *variation* or declination of the needle, is properly defined, the angle which a magnetic needle, ſuſpended at liberty, makes with the meridian line on a horizontal plane; or an arch of the horizon, comprehended between the true, and the magnetical meridian. See Needle.

In the ſea language, the *variation* is uſually called *north-eaſting*, or *north-weſting*. See Compass, *&c.*

All magnetic bodies, we find, range themſelves, in ſome ſort, to the meridian; but it is rare they fall in preciſely with it: in one place, they decline from the north to the eaſt, and from the ſouth to the weſt; and in another place, on the contrary, from the north to the weſt, and from the ſouth to the eaſt; and that, too, differently, at different times. See Magnet, and Magnetism.

Various are are the hypotheſes framed, to account for this extraordinary phænomenon: we ſhall only mention ſome of the later, and more probable. The firſt is that of Gilbert, which is followed by Cabeus, *&c.*

Their notion was, that it is the earth, or land, that draws the needle out of its meridianal direction; and hence they argued, that the needle varied more, or leſs, as it was more or leſs diſtant from any great continent: conſequently, that if it were placed in the middle of an ocean, equally diſtant from equal tracts of land, on each ſide, eaſtward and weſtward,

ward, it would not decline either to the one or the other; but point juſtly north and ſouth.

Thus, in the Azores iſlands, which are equally diſtant from Africa on the eaſt, and America on the weſt, there is, in effect, found no *variation*; but, as from the Azores you ſail towards Africa, the needle begins to decline from the north to the eaſt, and that ſtill more and more, till you reach the ſhore.

If you ſtill proceed eaſtward, the declination gradually diminiſhes again; by reaſon of the land left behind on the weſt, which continues to draw the needle.

The ſame holds till you arrive at a place where there are equal tracts of land on each ſide, and there, again, there is no *variation*.

The obſervations of our mariners in their Eaſt-India voyages, ſeem to confirm this ſyſtem: as they proceed towards the cape of Good Hope, the *variation* is ſtill eaſtward; at length, arriving at the cape De las Aguillas, *q. d.* of the Needles, the meridian line, then, dividing Africa into two equal parts, there is no *variation* at all: but as they proceed further, and leave the African coaſts on the weſt, the *variation* becomes weſtward.

But the misfortune is, the law does not hold univerſally: in effect, a great number of obſervations of the *variations*, in various parts, made and collected by Dr. Halley, overturn the whole theory.

Others, therefore, having recourſe to the frame and compages of the earth, conſidered as interwove with rocks and ſhelves, which being generally found to run towards the poles, the needle comes to have a general tendency that way; but which ſeldom going perfectly in the direction of the meridian, the needle, of conſequence, has commonly a *variation*. See EARTH.

Others hold various parts of the earth to have various degrees of the magnetic virtue; as ſome are more intermixed with heterogeneous matters, which prevent the free action or effect thereof, than others. See MAGNETISM.

Others aſcribe all to magnetic rocks, and iron mines, which affording more of the magnetic matter than other parts, draw the needle more. See IRON, *&c.*

Laſtly, others imagine earthquakes, or high tides, to have diſturbed and diſlocated ſeveral conſiderable parts of the earth, and ſo changed the magnetic axis of the globe, which originally was the ſame with the axis of the globe itſelf.

But ſtill, that great phænomenon, the *variation of the variation*, i. e. the continual change of the declination, in one and the ſame place, which the modern obſervations do abundantly evince, is not accountable for, on any of theſe foundations; nor even conſtant with them.

Dr. Halley, therefore, gives us a new ſyſtem; the reſult of a great number of obſervations; and even of a great number of voyages made, at the public charge, on this very account. The light that excellent author has let into this obſcure part of natural hiſtory, is very great; and the conſequences thereof in navigation, *&c.* very conſiderable. Add, that he has reduced the divers *variations* of divers places, to a preciſe rule, or order, which before appeared all precarious and arbitrary. His theory, therefore, will deſerve a more ample detail.—The obſervations it is built on, as laid down in the *Philoſophical Tranſactions*, are as follow.

Obſervations of the variations *of the needle, in divers places, and at divers times.*

From theſe obſervations, the learned author gathers, 1°. That throughout all Europe, the *variation*, at this time, is weſt; and more in the eaſtern parts thereof than the weſtern, increaſing that way.

2°. That on the coaſts of America, the *variation* is weſterly; increaſing all the way as you go northerly along the coaſt; ſo as to be above 20 degrees at Newfoundland, nearly 30 degrees in Hudſon's Streights, and not leſs than 57 degrees in Baffin's bay: and that as you ſail eaſtward from this coaſt, the *variation* diminiſhes. Hence, he argues, ſomewhere between Europe and the north part of America, there muſt be an eaſterly *variation*, or at leaſt no *variation*.

3°. That on the coaſt of Brazil, there is eaſt *variation*; increaſing as you go to the ſouthward, ſo as to be 12 degrees at cape Frio, and 20 degrees and half over-againſt R. Plata; and thence ſailing ſouth-weſterly, to the Streights of Magellan, it decreaſes 17 degrees, and at the weſt entrance about 14 degrees.

4°. That eaſtward of Brazil, this eaſterly *variation* decreaſes, ſo as to be very little at S. Helena and Aſcenſion, and to be quite gone, and the compaſs point true, about 18 degrees longitude from the cape of Good Hope.

5°. That to the eaſtward of the aforeſaid places, a weſtward *variation* begins and governs in all the Indian ſea, riſing to 18 degrees under the equator, about the meridian of the northern part of Madagaſcar; and 27 degrees and a half, in 39 degrees ſouth latitude, near the ſame meridian: eaſterly from thence, the weſt *variation* decreaſes, ſo as to be not much above eight degrees at cape Comorin, and about three degrees upon the coaſt of Java; and about the Molucca iſlands to be quite gone; as alſo a little to the weſtward of Van Diemen's land.

6°. That to the eaſtward of the Molucca's, and Van Diemen's land, in ſouth latitude, there ariſes another eaſterly *variation*, which ſeems not ſo great as a former, nor of ſo large extent; for that at the iſland Rotterdam, it is ſenſibly leſs than upon the eaſt coaſt of New Guinea; and at the rate it decreaſes, it may well be ſuppoſed, that about 20 degrees further eaſtward, or 225 degrees eaſt longitude from London, in the latitude of 20 degrees ſouth, a weſterly *variation* begins.

7°. That the *variation* taken at Baldivia, and at the weſt entrance of the Streights of Magellan, ſhews, that the eaſt *variation* noted in the third obſervation, is decreaſing apace; and that it cannot well extend many degrees into the South ſea, from the coaſt of Peru and Chili; leaving room for a ſmall weſterly *variation*, in that tract of the unknown world, that lies in the mid-way between Chili, and New Zealand, and between Hounds Iſland, and Peru.

8°. That in ſailing north-weſt from S. Helena, by Aſcenſion, as far as the equator, the *variation* continues very ſmall eaſt, and, as it were, conſtantly the ſame: ſo that in this part of the world, the courſe, wherein there is no *variation*, is evidently no meridian, but rather north-weſt.

9°. That the entrance of Hudſon's Streights, and the mouth of R. Plata, being nearly under the ſame meridian, at the one place the needle varies 29 degrees and a half weſt; at the other 20 degrees and a half eaſt.

Theory of the VARIATION *of the needle.*—From the circumſtances above rehearſed, the learned author takes occaſion to aſſert, “ That the whole globe of the earth is one great magnet, having four magnetical poles, or points of attraction; “ near each pole of the equator, two; and that in thoſe parts “ of the world which lie nearly adjacent to any one of theſe “ magnetical poles, the needle is governed thereby; the “ neareſt pole being always predominant over the more remote.”

The pole which at preſent is neareſt to us, he conjectures to lie in, or near the meridian of the Lands-end of England, and not above 7 degrees from the arctic pole: by this pole, the *variation* in all Europe and Tartary, and the North ſea, are principally governed; though ſtill with ſome regard to the other northern pole, whoſe ſituation is in the meridian, paſſing about the middle of California, and about 15 degrees from the north pole of the world; to which the needle has chiefly reſpect in all the North America, and in two oceans on either ſide thereof, from the Azores, weſtwards, to Japan, and farther.

The two ſouthern poles, he imagines, are rather farther diſtant from the ſouth pole of the world: the one about 16 degrees therefrom, in a meridian ſome 20 degrees to the weſtward of Magellan Streights, or 95 degrees weſt from London: this commands the needle in all South America, in the Pacific ſea, and the greateſt part of the Ethiopic ocean.—The other ſeems to have the greateſt power, and the largeſt dominion of all, as it is the moſt remote from the pole of the world, being little leſs than 20 degrees diſtant therefrom, in the meridian which paſſes through New Holland, and the iſland Celebes, about 120 degrees eaſt from London: this pole is predominant in the ſouth part of Africa, in Arabia, and the Red ſea, in Perſia, India, and its iſlands; and all over the Indian ſea, from the cape of Good Hope, eaſtwards, to the middle of the great South ſea, that divides Aſia from America.

Such ſeems to be the preſent diſpoſition of the magnetical virtue, throughout the whole globe of the earth.—It remains to ſhew, how this hypotheſis accounts for all the *variations* that have been obſerved of late; and how it anſwers to the ſeveral remarks drawn from the table.

1°. Then, it is plain, that as our European north pole is in the meridian of the Lands-end of England, all places more eaſterly than that, will have it on the weſt ſide of their meridian; and conſequently the needle, reſpecting it with its northern point, will have a weſterly *variation*; which will ſtill be greater as you go to the eaſtwards, till you come to ſome meridian of Ruſſia, where it will be the greateſt, and from thence decreaſe again.—Accordingly, in fact, we find that at Breſt the *variation* is but 1 degree 3 quarters; at London, 4 degrees and an half; and at Dantzick, 7 degrees weſt (in 1683).—Again, to the weſtward of the meridian of the Land's-end, the needle ought to have an eaſterly *variation*; were it not that (by approaching the American northern pole, which lies on the weſt ſide of the meridian, and ſeems to be of greater force than this other) the needle is drawn thereby weſtward, ſo as to counterbalance the direction given by the European pole, and to make a ſmall weſt *variation* in the meridian of the Land's-end itſelf. Yet, about the iſle Tercera, it is ſuppoſed our neareſt pole may ſo far prevail, as to give the needle a little turn to the eaſt; though but for a very little ſpace; the counter-balance of thoſe two poles permitting no conſiderable *variation*, in all the eaſtern part of the Atlantic ocean; nor upon the weſt coaſts of England, and Ireland, France, Spain, and Barbary.—But to the weſtward of the Azores, the power of the American pole overcoming that of the European, the needle has chiefly reſpect thereto; and turns ſtill more and more towards it, as you approach it. Whence it comes to paſs, that on the coaſt of Virginia, New England, Newfoundland, and in Hudſon's Streights, the *variation* is weſtward; that is, increaſes as you go from thence towards Europe: and that it is leſs in Virginia, and New England, than in Newfoundland, and Hudſon's Streights.

2°. This weſterly *variation*, again, decreaſes, as you paſs over the north America, and about the meridian of the middle of California, the needle again points due north; and from thence weſtwards, to Yedzo and Japan, it is ſuppoſed the *variation* is eaſterly; and half ſea over, not leſs than 15 degrees: and that this eaſt *variation* extends over Japan, Yedzo, Eaſt Tartary, and part of China, till it meet with the weſterly, which is governed by the European north pole, and which is the greateſt ſomewhere in Ruſſia.

3°. Towards the ſouth pole the effect is much the ſame; only that here the ſouth point of the needle is attracted.—Whence it will follow, that the *variation* on the coaſt of Braſil, at the river of Plata, and ſo on to the Streights of Magellan, ſhould be eaſterly, if we ſuppoſe a magnetical pole, ſituate about 20 degrees more weſterly than the Streights of Magellan.—And this eaſterly *variation* extends eaſtward over the greateſt part of the Ethiopic ſea, till it be counterpoiſed by the virtue of the other ſouthern pole; as it is about midway, between the cape of Good Hope, and the iſles of Triſtan d'Acunha.

4°. From thence eaſtwards, the Aſiatic ſouth pole becoming prevalent, and the ſouth point of the needle being attracted thereby, there ariſes a weſt *variation*, very great in quantity and extent; becauſe of the great diſtance of this magnetical pole of the world.—Hence it is, that all the Indian ſea, as far as Hollandia Nova, and farther, there is conſtantly a weſt *variation*, and that under the equator itſelf, it riſes to no leſs than 18 degrees, where it is moſt.—Add, that about the meridian of the iſland of Celebes, being likewiſe that of this pole, this weſterly *variation* ceaſes, and an eaſterly begins, which reaches to the middle of the South ſea, between the middle of Zelandia Nova, and Chili; leaving room for a ſmall weſt *variation*, governed by the American ſouth pole.

5°. From the whole it appears, that the direction of the middle, in the temperate and frigid zone, depends chiefly upon the counterpoiſe of the forces of two magnetical poles of the ſame nature; as alſo why, under the ſame meridian, the *variation* ſhould be in one place 29 degrees and a half weſt, and in another 20 degrees and a half eaſt?

6°. In the torrid zone, and particularly under the equinoctial, reſpect muſt be had to all four poles, and their poſitions well conſidered; otherwiſe it will not be eaſy to determine what *variations* ſhall be; the neareſt pole being always ſtrongeſt: yet not ſo, as not to be counterbalanced ſometimes by the united forces of two more remote.—Thus, in ſailing from S. Helena by the iſle of Aſcenſion, to the equator, on the north-weſt courſe, the *variation* is very little eaſterly, and in that whole tract unalterable; becauſe the ſouth American pole (which is conſiderably the neareſt in the aforeſaid places) requiring a great eaſterly *variation*, is counterpoiſed by the contrary attraction of the north American, and the Aſiatic ſouth pole; each whereof, ſingly, is, in theſe parts, weaker than the American ſouth pole: and upon the north-weſt courſe, the diſtance from this latter is very little varied; and as you recede from the Aſiatic ſouth pole, the balance is ſtill preſerved by acceſs towards the north American pole.—In this caſe, no notice is taken of the European north pole; its meridian being little removed from thoſe of theſe places, and of itſelf requiring the ſame *variations* we here find.

After the ſame manner, may the *variations* in other places, under, and near the equator, be accounted for: ſo that the hypotheſis muſt be allowed very adequate, and ſufficient for the phænomena. See VARIATION *of the* VARIATION.

To obſerve the VARIATION, *or declination of the needle.*—Draw a meridian line, as directed under the article MERIDIAN: then, a ſtyle being erected in the middle thereof, place a needle thereon, and draw the right line it hangs over.—Thus will the quantity of the *variation* appear. See COMPASS.

Or thus:—As the former method of finding the declination, cannot be applied at ſea, others have been thought of; the principal whereof follow.—Suſpend a thread and plummet over the compaſs, till the ſhadow paſs through the centre of the card: obſerve the rhumb, or point of the compaſs, which the ſhadow touches when it is the ſhorteſt.—For the ſhadow is then a meridian line: conſequently the *variation* is ſhewn.

Or thus:—Obſerve the rhumb wherein the ſun, or ſome ſtar riſes and ſets: biſſect the arch intercepted between the riſing and ſetting; the line of biſſection will be the meridian line: conſequently the declination is had as before.—The ſame may be had from two equal altitudes of the ſame ſtar, obſerved either by day or night.

Or thus:—Obſerve the rhumb wherein the ſun, or a ſtar riſes and ſets; and from the latitude of the place, find the eaſtern or weſtern amplitude: for the difference between the amplitude and the diſtance of the rhumb obſerved, from the eaſtern rhumb of the card, is the *variation* ſought.

Or thus:—Obſerve the altitude of the ſun, or ſome ſtar, SI, (*Tab. Navigation, fig.* 16.) whoſe declination is known; and note the rhumb in the compaſs, to which it then correſponds.—Since then in the triangle ZPS we have three ſides, *viz.* PZ, the complement of the elevation of the pole PR; SP, the complement of the declination DS; and ZS, the complement of the altitude SI; the triangle PZS is found by ſpherical trigonometry, (ſee TRIANGLE:) the contiguous one to which, *viz.* AZS, meaſures the azimuth HI.—The difference then, between the azimuth, and the diſtance of the rhumb obſerved from the ſouth, is the *variation* ſought.

Note, to have the eaſtern or weſtern amplitude accurately, regard muſt be had to the refraction; the laws whereof are delivered under the article REFRACTION.

For the more commodious obſerving in what rhumb of the compaſs the ſun, or a ſtar is ſeen, it will be proper to have two little apertures, or glaſs windows, oppoſite to each other under the limb thereof; with a teleſcope-ſight fitted to one of them, and to the other a fine thread.

VARIATION *of the* VARIATION, is the change in the declination of the needle, obſerved, at different times, in the ſame place.

This *variation*, firſt, it is ſaid, diſcovered by Gaſſendus, is found to obſerve one and the ſame law pretty regularly.—It is ſuppoſed, owing to the difference of velocity of the motions of the internal and external parts of the globe.

Theory of the VARIATION *of the* VARIATION.—From the obſervations above recited, under the head VARIATION, it ſeems to follow, that all the magnetical poles have a motion weſtward: but if it be ſo, it is evident, that it is not a rotation about the axis of the earth: for then the *variations* would continue the ſame, in the ſame parallel of latitude (the longitude only changed) as much as the motion of the magnetical poles: but the contrary is found by experience; for there is no where, in the latitude of 51 and a half north, between England and America, a *variation* of 11 degrees eaſt, at this time; as it was once here at London.—Wherefore, it ſeems that our European pole is grown nearer the arctic pole than it was heretofore; or elſe, that it has loſt part of its virtue.

But whether theſe magnetic poles move all together with one motion, or with ſeveral; whether equally, or unequally; whether circular, or libratory: if circular, about what centre; if libratory, after what manner? are things yet unknown.

This theory ſeems yet ſomewhat obſcure, and defective: to ſuppoſe four poles in one magnetical globe, in order to account for the *variation*, is a little unnatural; but to conceive thoſe poles to move, and that by ſuch laws as to ſolve the *variation* of the *variation*, is ſtill more extraordinary.—In effect, the ſolution appears not much leſs implicit and arbitrary than the problem.

The learned author of the theory, therefore, found himſelf under a neceſſity to ſolve the phænomena of his ſolution; and with this view, preſented the following hypotheſis.

The external parts of the globe, he conſiders as the ſhell, and the internal as a nucleus, or inner globe; and between the two he conceives a fluid medium.—That inner earth having the ſame common centre, and axis of diurnal rotation, may turn about with our earth each 24 hours. Only the outer ſphere having its turbinating motion ſome ſmall matter either ſwifter or ſlower than the internal ball; and a very minute difference in length of time, by many repetitions, becoming ſenſible; the internal parts will, by degrees, recede from the external; and not keeping pace with one another, will appear gradually to move, either eaſtward, or weſtward, by the difference of their motions.

Now, ſuppoſe ſuch an internal ſphere, having ſuch a motion, the two great difficulties in the former hypotheſis are eaſily ſolved: for if this exterior ſhell of earth be a magnet, having its poles at a diſtance from the poles of diurnal rotation, and if the internal nucleus be likewiſe a magnet, having its poles in two other places, diſtant alſo from the axis; and theſe latter, by a gradual and ſlow motion, change their place, in reſpect of the external: we may then give a reaſonable account of the four magnetical poles aforementioned, as likewiſe of the changes of the needle's *variation*.

The period of this motion being wonderful great, and there being hardly an hundred years ſince theſe *variations* have been duly obſerved; it will be very hard to bring this hypotheſis to a calculus: eſpecially ſince, though the *variations* do increaſe and decreaſe regularly in the ſame place, yet in differing places, at no great diſtance, there are found ſuch caſual changes thereof, as can no ways be accounted for by a regular hypotheſis; but ſeem to depend upon the unequal and irregular diſtribution of the magnetical matter, within the ſubſtance of the external ſhell or coat of the earth, which deflect the needle from the poſition it would acquire from the effect of the general magnetiſm of the whole.—Of which, the *variations* at London and Paris, give a notable inſtance; for the needle has been conſtantly about 1 ½ more eaſterly at Paris than at London: though it be certain, that according to the general effect, the difference ought to be the contrary way; notwithſtanding which, the *variations*, in both places, do change alike.

Hence, and from ſome other things of like nature, it ſeems plain, that the two poles of the external globe are fixed in the earth; and that if the needle were wholly governed by them, the *variations* thereof would be always the ſame, with ſome irregularities, upon the account juſt now mentioned.—But the internal ſphere having ſuch a gradual tranſlation of its poles, does influence the needle, and direct it variouſly, according to the reſult of the attractive or directive power of each pole; and, conſequently, there muſt be a period of the revolution of this internal ball; after which, the *variations* will return again, as before. But if it ſhall in future ages be obſerved otherwiſe, we muſt then conclude, that there are more of theſe internal ſpheres, and more magnetical poles than four; which, at preſent, we have not a ſufficient number of obſervations to determine, and particularly in that vaſt Mar del Zur, which occupies ſo great a part of the whole ſurface of the earth.

If then two of the poles be fixed, and two moveable, it remains to aſcertain, which they are that keep their place.

The author thinks it may be ſafely determined, that our European north pole is the moveable one of the two northern poles, and that which has chiefly influenced the *variations* in theſe parts of the world: for in Hudſon's Bay, which is under the direction of the American pole, the change is not obſerved to be near ſo faſt, as in theſe parts of Europe, though that pole be much farther removed from the axis.—As to the ſouth poles, he takes the Aſiatic pole to be fixed, and conſequently the American pole to move.

This granted, it is plain the fixed poles are the poles of this external ſhell, or cortex of the earth; and the other the poles of the magnetical nucleus, included and moveable within the other.—It likewiſe follows, that this motion is weſtwards; and, by conſequence, that the aforeſaid nucleus has not preciſely attained the ſame degree of velocity, with the exterior parts in their diurnal revolutions; but ſo very nearly equals it, that in 365 revolves, the difference is ſcarce ſenſible.—That there is any difference ariſes hence, that the impulſe, whereby the diurnal motion was impreſſed on the earth, was given to the external parts; and from thence, in time, communicated to the internal: but not ſo, as yet perfectly to equal the velocity of the firſt motion impreſſed on, and ſtill conſerved by, the ſuperficial parts of the globe.

As to the preciſe period, we want obſervations to determine it; though the author thinks we may, with ſome reaſon, conjecture, that the American pole has moved weſtward 46 degrees in 90 years; and that the whole period thereof is performed in about 700 years.

Mr. Whiſton, in his *New laws of Magnetiſm*, raiſes ſeveral objections againſt this theory; which ſee under the article MAGNETISM.

VARIATION *of Quantities*, in algebra. See CHANGE, and COMBINATION.

VARIATION, in aſtronomy.—The *variation of the moon*, called by Bullialdus, the *reflection of her light*, is the third inequality obſerved in the moon's motion; whereby, when out of the quadratures, her true place differs from her place twice equated. See PLACE, EQUATION, &c.

Sir Iſaac Newton takes the moon's *variation* to ariſe partly from the form of her orbit, which is an ellipſis; and partly from the inequality of the parts of ſpace, which the moon deſcribes in equal times, by a radius drawn to the earth. See MOON.

To find the greateſt variation, obſerve the moon's longitude in the octants; and for the time of obſervation, compute the moon's place quite equated: the difference between the computed, and the obſerved place, is the greateſt *variation*.

Tycho makes the greateſt *variation* 40′ 30″: Kepler makes 51′ 49″; Sir Iſaac Newton makes the greateſt *variation* at a mean diſtance between the ſun and the earth, to be 35′ 9″; at the other diſtances, the greateſt *variation* is in a ratio compounded of the duplicate ratio of the times of the moon's ſynodical revolution directly, and the triplicate ratio of the diſtance of the ſun from the earth inverſly. *Phil. Nat. Princ. Math.* Prop. XXXIX. Lib. iii.

VARIATION, in the Italian muſic, is underſtood of the different manners of playing, or ſinging a tune, or ſong; whether by ſubdividing the notes into ſeveral others of leſſer value, or by adding graces, &c.—In ſuch manner, however, as that one may ſtill diſcern the ground of the tune through all the enrichments; which ſome call *embroideries*.

Thus, *e. gr.* the divers couples of chacons, Spaniſh folies, gavots, French paſſecaillies, &c. are ſo many *variations*: ſo alſo many diminutions of courants, gavots, and other pieces for the lute, harpſichord, &c. are real *variations*.

VARICIFORMES *Paraſtatæ*, in anatomy, a name which ſome authors give to two veſſels near the bladder; by reaſon of their many turnings; ſerving to work and prepare the ſeed the better. See PARASTATÆ, and DEFERENTIA *Vaſa*.

VARICOSUM *Corpus*, in anatomy, the ſame as *corpus pyramidale*. See PYRAMIDALE *Corpus*.

VARICOUS *Ulcers*. See the article ULCER.

VARIEGATION, among botaniſts and floriſts, the act of ſtreaking or diverſifying the leaves, &c. of plants and flowers, with ſeveral colours.

Variegation is either *natural*, or *artificial*.—Of *natural variegation* there are four kinds; the firſt ſhewing itſelf in yellow ſpots, here and there in the leaves of plants; called by gardeners the *yellow bloach*.

The ſecond, called the *white bloach*, marks the leaves with a greater number of white ſpots, or ſtripes; the whiteſt lying next the ſurface of the leaves, uſually accompanied with other marks of a greeniſh white, that lie deeper in the body of the leaves.

The third, and moſt beautiful, is, where the leaves are edged with white, being owing to ſome diſorder or infection in the juices, which ſtains the natural complexion or verdure of the plant.

The fourth kind is that called the *yellow edge*.

Variegation is, in itſelf, a diſeaſe; and theſe are only ſo many ſpecies, or rather degrees thereof.—In the yellow, the diſeaſe is the ſlighteſt: the white is a ſure ſign of a deep infection, and weakneſs in the plant: which is further evinced by this; that no two leaves are ever marked exactly alike.—This ſometimes degenerates into the third, or edge kind; which is a total and immoveable diſeaſe, that lays hold not only of the leaves, but of the wood, and even the fruit, ſeed, *&c.*

In the two firſt kinds, there is a poſſibility of recovering the plants to their native verdure, by inarching them into a healthful ſtock of the ſame ſpecies, and letting the ſtocks ſtand a year or two joined together; by which means, the juices of the ſtrong ſtock overpowering the diſtemper, throw off the morbid humours by perſpiration: but the third kind is incurable; no art can recover the edged plant to produce plain green leaves again.

Artificial Variegation, is performed by inarching or inoculating a ſtriped, or *variegated* plant into a plain one of the ſame ſort; as a *variegated* common jeſſamin, into a plain, common, Spaniſh, Brazil, or Indian jeſſamin. See INOCULATION, and ABLACTATION.

A ſingle bud, or eye, Mr. Bradley obſerves, being placed in the eſcutcheon of a diſtempered tree, where it can only receive nouriſhment from the vitiated juices, will become *variegated*, proportionably to the nouriſhment it draws; and will partake more of the white or yellow juice, than if a branch ſhould be inarched: the bud having nothing to nouriſh it, but the juices of the plant it is inoculated on; whereas, a cyon inarched, is fed both by the ſtriped plant, and the healthful one.

As to the natural ſtripes, or *variegations*, there are ſome particular circumſtances to be obſerved: 1°. That ſome plants only appear *variegated*, or bloached in the ſpring and autumn; the ſtains diſappearing as they gather ſtrength in ſummer: of this kind are rue, thyme, and pot marjoram.

2°. Some plants are continually bloached in the ſpongy part of their leaves; the ſap-veſſels, all the time, remaining of a healthful green: ſuch are the alternus, orange-mint, *&c.* which, being ſtrengthned by rich manure, or being inarched into healthful plants, throw off the diſtemper.

3°. In other plants, the diſeaſe is ſo rooted and inveterate, that it is propagated with the ſeed: ſuch are the archangel, water betony, bank creſs, borrage, ſtriped ſelary, and ſycamore; the ſeeds of which produce ſtriped plants.

VARIOLÆ*, or VARIOLI, a contagious diſeaſe, popularly called the *ſmall-pox.* See *Small*-POX.

* It is called *variolæ*, as ſhewing itſelf in puſtules, or little tumours like *varices*; or as variegating the ſkin. See VARIX, *&c.*

VARIORUM,* in matters of literature, a term or phraſe of abbreviation, uſed for an edition of a claſſic author, printed in Holland, with the notes of divers authors thereupon: *Cum notis variorum*, or *cum ſelectis variorum obſervationibus.*

In this ſenſe, we ſay, *Plautus variorum*; a ſet of Dutch *variorums*, &c.—The *variorums*, for the generality, are the moſt valued editions.

* The word is the genitive plural of the Latin *varius*, different, divers.

VARIX,* in medicine, a dilatation of a part of a vein, ſo as to make it buldge out, and form a little, ſoft, knotty, painleſs tumor. See VEIN, ANEURYSM.

* The word is pure Latin, formed from the verb *variare*; by reaſon of the turns and meanders of the veins, which the tumor ſometimes follows.

Sometimes it is confined to one ſingle branch of a vein; and ſometimes it extends to ſeveral: and ſometimes runs crooked, and bent, in various knots and circumvolutions.

It happens ofteneſt to the crural and hæmorrhoidal veins; ſometimes, alſo, to thoſe in the teſtes, and frequently in the abdomen and breaſts of pregnant women, and ſuch as give ſuck. It is ſuppoſed owing to the great abundance, or thickneſs of the blood; or the relaxation of the membranes of the veins; immoderate labour, ſprains, cramps, too great preſſure or ſtricture by bandages. Stagnations of the blood, from a plethora, cachochymia, *&c.* may alſo give occaſion thereto.

Melancholic perſons, and thoſe who feed on coarſe meats, are moſt ſubject to them: the generality of women with child, have *varices* on their thighs and legs, occaſioned by the fœtus compreſſing the iliac veins; and by that means, preventing the reflux of blood to the heart.

Varices happening ſpontaneouſly, and proving of a moderate ſize, are rarely dangerous; but even are allowed ſerviceable in caſe of the hæmorrhoids.—When immoderate, they ſometimes occaſion a cachexy, dropſy, or conſumption.

The cure is to be attempted by evacuations, as phlebotomy, and cathartics; external applications, as diſcutient fomentations, cataplaſms, embrocations, bandages, *&c.* Or, laſtly, where the caſe grows dangerous, by inciſion.

Hernia VARICOSA, the ſame with *cirſocele.* See CIRSOCELE.

The *hernia varicoſa* is known by the ſituation of the tumor, the courſe of the vein, relaxation of the part, or its appearing inflated with air, diſtended, and painful. See HERNIA.—It is remedied by a proper truſs, or bandage, with the medicines abovementioned.

VARLET. See the article VALET.

VARNISH, or VERNISH, VERNIX, a thick, viſcid, gloſſy liquor; uſed by painters, gilders, and various other artificers, to give a gloſs and luſtre to their works, as alſo to defend them from the weather, duſt, *&c.*

There are divers kinds of *varniſhes*, all made of gums diſſolved in ſpirit of wine.

White VARNISH is uſually made of gum ſandarach and gum maſtick diſſolved in ſpirits, left to ſettle two days, then ſtrained through a linen cloth, and after ſtanding ſome time, the clear poured off, and bottled for uſe.

The more curious artiſts diſſolve the two gums ſeparately; and having made a ſeparate *varniſh* of each, mix them occaſionally, as their work requires a ſtiffer or a ſofter *varniſh.*

But for the *beſt white varniſh*, more gums are required, *viz.* Venice turpentine, gum copal, elemi, benzoin, animæ, and white roſin.

Lacc-VARNISH, is made of gum lacca and ſpirit of wine, frequently ſhaken till the gum be diſſolved, then ſtrained, and the clear decanted off, as above.

The lacc ought to be of the kind called ſeed-lacc.—Though for varniſhing ordinary woods, ſhell lacc is often uſed.—But this will not ſtand againſt the weather.

Beſides theſe, there are *hard*, and *ſoft varniſhes*, or grounds, uſed by the etchers, and engravers. See ETCHING.

VARNISH, is alſo uſed for a kind of gloſſy coat, wherewith potters ware, Delft ware, China ware, *&c.* are covered, to give them a ſmoothneſs, and luſtre.—Melted lead, is the *varniſh* ordinarily uſed for the firſt; and ſmalt for the ſecond. See POTTERS.

The true *varniſh* uſed by the Chineſe, and Japaneſe, to give that inimitable luſtre to their porcelain, is one of the grand ſecrets in that manufacture; and almoſt the only thing wanting, to make Delft and French ware vie with the Chineſe. Several have deſcribed the preparation thereof; particularly Kircher: but none ever ſucceeded in the trial. See PORCELAIN.

VARNISH is alſo a term applied to the colours which antique medals acquire in the earth. See MEDAL.

The value of a medal is heightened by a beauty, which nature alone is able to give, and art has never yet attained to counterfeit: we mean, the colour or *varniſh*, which certain ſoils tinge the medal withal; ſome with a blue, almoſt as beautiful as that of a turquoiſe; others with an inimitable vermilion colour; others with a gloſſy ſhining brown, infinitely beyond any of our figures in bronze.

The moſt uſual *varniſh* is a fine green, which hangs to the moſt delicate ſtrokes, without effacing them; much more accurately than the fineſt enamel does on metals.

Braſs alone is ſuſceptible of it; for as to ſilver, the green ruſt that gathers on it, always ſpoils it; and it muſt be ſcowered off with vinegar, or lemon juice.

There is alſo a *falſe*, or *modern varniſh*; which the falſifiers of medals give to their counterfeits, to give them the air of antiquity: it is diſcovered by its being ſofter than the natural *varniſh*, which is as hard as the metal itſelf.

Some lay their ſpurious medals under ground, where they contract a degree of *varniſh*, that may impoſe on the leſs knowing: others uſe ſal armoniac, mixed with vinegar, others burnt paper.

VAROLI *Pons.* See the article PONS.

VAS, *Veſſel.* See VESSEL, VESICULA, ANGEIOLOGY.—Hence (in the ſtile of anatomiſts) the *Vaſa adipoſa*, *præparantia*, &c.

VAS *Breve*, *Short* VESSEL, in anatomy, a veſſel at the bottom of the ſtomach; thus called from its ſhortneſs. See STOMACH.

It ſends divers little branches from the bottom of the ſtomach to the ſpleen; or, according to the uſe the ancients imagined it to be of, from the ſpleen to the ſtomach: for their notion was, that, by means of this veſſel, the ſpleen ſupplied the ſtomach with an acid juice: which acting on the inner nervous membranes of the ſtomach, cauſed the ſenſation of hunger; and at the ſame time mixing with the foods contained therein, aſſiſted, by its acid quality, in the diſſolution thereof. See SPLEEN, HUNGER, *&c.*

But upon examining the little branches of this veſſel more accurately, we find, they do not pierce into the ſtomach, and that they are no more than branches of veins, ſerving to return the blood into the ſplenic vein; whence it paſſes into the vena porta. See SPLENIC, and PORTA.

VASA *Concordia*, among hydraulic authors, are two veſſels, ſo conſtructed, as that one of them, though full of wine, will not run a drop; unleſs the other, being full of water, do run alſo.—Their ſtructure and apparatus may be ſeen in Wolfius, *Element. Matheſ.* T. II. Hydraul.

VASCULAR, VASCULARIS, in anatomy, is applied to any thing conſiſting of divers veſſels, veins, arteries, *&c.*

We ſay, the *vaſcular* and valvular texture of the lungs.—All the fleſh in an animal body, is found to be *vaſcular*, none of it parenchymous, as the antients imagined. See FLESH, PARENCHYMA, *&c.*

VASCULAR *Glands.* See the article GLAND.

VASCULAR *Glands*. See the article GLAND.

VASCULAR, VASCULARIUS, in antiquity, was the denomination of a kind of artificers, among the antient Romans; who made ſilver and gold veſſels without relievo's, or figures imboſſed thereon.

Hence, according to Salmaſius, it is, that Cicero, in his ſixth oration againſt Verres, diſtinguiſhed *vaſcularius* from *cælator*, engraver.

In the art called by the Greeks εμπαιςικη, which was the art of ſuperadding ornaments of precious ſtones, or rich metals, to vaſes of other metals; the *vaſcularii* and cælatores were different; the firſt being the goldſmiths who made the vaſe, the ſecond, the ſculptors who added the ornaments.—But in the art called τορευτιχη, or the art of cutting bas reliefs, or ſtamping figures on metal; the *vaſcularii* were alſo cælators, or engravers: that is, they who made the vaſe, made alſo the relievos, or figures, wherewith it was enriched. See SCULPTURE, &c.

VASCULIFEROUS *Plants*, among the botaniſts, ſuch as have a peculiar veſſel or caſe to contain the ſeed; which is ſometimes divided into cells. See PLANT.

Theſe have always a monopetalous flower; either uniform, or difform. See MONOPETALOUS.

The former have all their ſeeds divided: 1°. Into two partitions, as the *hyoſcyamus*, *nicotiana*, *priapeia*, and the *gentiana*. 2°. Into three partitions, as the *convolvulus*, *ſpeculum veneris*, *trachelium*, *repunculus* or *campanula*, *repunculus corniculatus*, &c. 3°. Into four partitions, as the *ſtramonium*. Thoſe of the latter kind, which have a difform monopetalous flower, as the *linaria*, *pinguicula*, *antirrhinum*, *ariſtolochia*, *ſcrophularia*, *digitalis*, *pedicularis*, *melampyrum*, *euphraſia*, &c.

VASE, a term of equal import with the Latin *vas*, whence it is formed; and the Engliſh *veſſel*. See VESSEL.

It is applied to the antient veſſels, dug from under ground, or otherwiſe found, and preſerved in cabinets, &c. as veſſels of ſacrifice, urns, &c. and to other more modern veſſels, which are rather of curioſity and ſhew, than uſe; as thoſe of cryſtal, porcelain, &c.

VASES, in architecture, or ornaments of ſculpture, placed on ſocles, or pedeſtals; repreſenting the veſſels of the antients; particularly thoſe uſed in ſacrifice, as the præfericulum, ſimpulum, incenſe-pots, flower-pots, &c. and occaſionally enriched with baſſo relievos.

They are commonly placed there to crown, or finiſh facades, or frontiſpieces. See CROWNING.—They are frequently alſo called *acroteria*; and are uſually inſulate. See ACROTERIA.

Vitruvius mentions a kind of *theatrical vaſes*, made of braſs, or earthen ware, called *echea*, ηχεια; which they diſpoſed in private places, under the ſteps and ſeats of the theatres, to aid and increaſe the reflection and reſonance of the actors voices, &c. See THEATRE.—It is ſaid, there are alſo *vaſes* of this kind in the cathedral church of Milan.

VASE is particularly uſed in architecture, to ſignify the body of the Corinthian and compoſite capital; called alſo the *tambour*, or *drum*; and ſometimes the *campana*, or *bell*.—See *Tab. Archit. fig.* 21. *lit. c. c.* See alſo CORINTHIAN, and TAMBOUR.

VASE is alſo ſometimes uſed among floriſts, for that they otherwiſe call the *calyx*.

The *vaſe*, or rather calyx of a tulip, is the top, or head of a tulip; the leaves whereof form a kind of *vaſe*, or cup. See CALYX.

Goldſmiths, braſiers, &c. alſo uſe *vaſe* for the middle of a church candleſtick; which is uſually of a roundiſh figure, bordering ſomewhat on that of a *vaſe*.

VASSAL,* VASSALLUS, in our antient cuſtoms, a perſon who vowed fidelity, and homage to a lord, on account of ſome land, &c. which he held of him, in fee. See FEALTY, HOMAGE, LORD, &c.

* Du Cange will have the word to come from *vaſſus*, which antiently ſignified a *ſervant*, or *domeſtic* of a prince, and ſome times alſo the *comites*, or *aſſeſſores* in public trials.—Menage, after Cujas, takes *vaſſal* to have been formed of *geſſel*, an antient German word, ſignifying *companion*.—Caſeneuve derives it from the Gauliſh *geſſus*, *a brave man*, from *geſſo*, or *geſſum*, or *jæſum*, a kind of javelin uſed among them.—Voſſius derives *vaſſal* from *vas*, *vadis*, *pledge*; whence alſo he will have it to be, that they are ſometimes called *fideles*.

The *vaſſal* was alſo called *piratus*, *lord's-man*, and *fee-man*; but now the denomination is changed into that of *tenant in fee*. See TENANT, VILLAIN, &c.

They ſometimes alſo uſed the term *vaſſour* for *vaſſal*; whence *vavaſour*. See VAVASOUR, and VAVASORY.

If a *vaſſal* offended his lord grievouſly, either in perſon, or in honour, he committed the crime of felony; which carried with it a confiſcation of his fee. See VASSALAGE, FELONY, &c.

A Rear VASSAL, is he who holds of a lord, who himſelf is *vaſſal* of another lord. See MESNE.

VASSAL was alſo antiently uſed for ſoldier; by reaſon fees, at firſt, were given to none but military men. See FEE.

VASSALAGE, the ſtate of a vaſſal; or a ſervitude and dependency on a ſuperior lord. See VASSAL, SERVICE, TENURE, &c.

Antiently, they diſtinguiſhed between *liege vaſſalage*, and *ſimple vaſſalage*.

Liege vaſſalage only belonged to the king; as carrying with it an obligation on the ſide of the vaſſal, to ſerve his lord in war, againſt all perſons whatever. See LIEGE.

In all *ſimple vaſſalage*, the fealty, or *liege vaſſalage*, was ſtill reſerved to the king. See FEALTY.

Some alſo diſtinguiſh *active vaſſalage*, and *paſſive*: the firſt is the right of fealty reſiding in the lord; the ſecond, the ſervice and duties incumbent on the tenant. See LORD, &c.

VASTO, in law, a writ that lies againſt the tenant for life, or years, for making waſte. See WASTE.

VASTUS, in anatomy, a name common to two muſcles of the leg, diſtinguiſhed into *internal* and *external*; thus called from their largeneſs: both of them ſerving to extend the leg.

VASTUS *Externus*, ſprings from the root of the great trochanter, and from the linea aſpera; outwardly tendinous, and inwardly fleſhy; and deſcending obliquely forwards, becomes, *vice verſa*, tendinous inwardly, and fleſhy outwardly; till meeting the tendon of the rectus, it grows quite tendinous, and is inſerted together with it.—See *Tab. Anat.* (*Myol.*) *fig.* 1. *n.* 60. *fig.* 2. *n.* 41. *fig.* 6. *n.* 35.

VASTUS *Internus*, ariſes likewiſe partly tendinous, and partly fleſhy, from the linea aſpera, immediately below the leſs trochanter, upon the outſide of the tibia; and is continued almoſt to the lower apophyſis thereof, on the inſide: whence it deſcends obliquely; and growing tendinous, is inſerted with the former.—See *Tab. Anat.* (*Myol.*) *fig.* 1. *n.* 55. *fig.* 2. *n.* 39. *fig.* 7. *n.* 42.

VAT, or FAT, a kind of veſſel, uſed to hold wine, ale, beer, cyder, or any other liquor, in the time of its preparation.

VATICAN,* VATICANUS, is properly the name of one of the ſeven hills whereon Rome ſtands: on the foot hereof is the ſamous church of S. Peter, hence called the *Vatican*; and a magnificent palace of the pope, which has the ſame denomination.—Hence ariſe divers figurative expreſſions; as *the thunderbolt of the Vatican*, q. d. the pope's anathema, &c.

* The word, according to Aulus Gellius, is derived from *vaticinium*, *prophecy*; by reaſon of the oracles and predictions which were uſed to be delivered there by the inſpiration of an antient deity, called *Vaticanus*; who was ſuppoſed to unbind the organs of ſpeech in new-born children; and whom others will have to be no other than Jupiter, conſidered in that capacity.

The Library of the VATICAN, is one of the moſt celebrated in the world: it is particularly remarkable for its manuſcripts.—Towards the beginning of the laſt century, it was greatly augmented by the addition of that of the elector Palatine.—It is open to all the world three or four times a week.—In it are ſhewn a *Virgil*, *Terence*, &c. above a thouſand years old; the manuſcript whereon the edition of the *Septuagint* was made; and abundance of rabbinical manuſcripts. See LIBRARY.

VATICINATION, VATICINATIO, the act of propheſying, or divining. See DIVINATION, and PROPHECY.

VAVASOR, VALVASOR, VAVASOUR, or VALVASOUR, in our antient cuſtoms, a diminute of *vaſſal*, or *vaſſor*; ſignifying a *vaſſal of a vaſſal*, or one who held a fee of another vaſſal. See VASSAL, and VAVASORY.

Yet Camden, and others, hold *vavaſor* to be a dignity, next below that of a baron: he adds, that the word is formed of *vas ſortitum ad valetudinem*, a veſſel choſen for ſafety, and health.—Others derive it *à valvis*, *quaſi obligatus ſit adſtare ad valvas domini*, *vel dignus ſit eas intrare*; as being a perſon obliged to wait at his lord's door, or as worthy to enter thereat: but the etymology is ridiculous enough.

Du Cange diſtinguiſhes two ſorts of vaſſals under this denomination.—The *great*, called *valvaſores*, who held of the king: ſuch were counts, and barons.—And the *leſſer*, called *valvaſani*, who held of the former.

VAVASORY,* VAVASORIA, the quality of the land, or fee held by a vavaſor. See VAVASOR.

* *Quod dicitur de baronia non eſt obſervandum in* vavaſoria, *vel aliis minoribus fœdis quam baronia, quia caput non habent ſicut baronia.* Bract. Lib. II. cap. 39.

There are *baſe vavaſories*, and *frank*, or *noble vavaſories*; according as it has pleaſed the lord to make his *vavaſor*.—*Baſe vavaſories*, are thoſe for which the lord of the fee owes ſummage, light-horſe, rents, or other ſervices.—*Free vavaſories*, are ſuch as are exempt from theſe ſervices.

VAUDOIS, VALDENSES, or WALDENSES, a name given to a ſect of reformers, who made their firſt appearance about the year 1160; or, as others will have it, about the year 1118.

The occaſion of their riſe is thus delivered:—“In an aſſembly of ſeveral of the more conſiderable citizens of Lyons, one of them fell down ſuddenly dead in the middle. —Upon which, Pierre Valdo, who was one of the number, being ſtruck with the accident, diſtributed a large ſum of money among the poor on the ſpot.—This drawing a great number of people to follow him, he exhorted them to embrace a voluntary poverty, after the example of Jeſus Chriſt, and his apoſtles: and as he was a man of ſome learning, he expounded to them the New Teſtament in the vulgar tongue.

“The clergy ſoon began to cry out on him as a raſh intruder: but he, deſpiſing their reprimands, ſtill held on; and even went further.—For the accuſations of the prieſts having exaſperated him, he began to declaim againſt them; expoſed their corrupt lives and morals; and even, by degrees, came to cenſure ſome of the corruptions in the diſcipline and doctrine of the church.”—And this paved ſome of the way to the Reformation.

The *Vaudois* had their name from this Valdo, whoſe retainers they were.—They were alſo called *Lyoniſts*, and *Sabatez*, or *Inſabatez*, or *Enſabatez*.

VAULT, *Fornix*, in architecture, an arched roof, ſo contrived, as that the ſeveral ſtones whereof it conſiſts, do, by their diſpoſition, ſuſtain each other. See Arch.

Vaults are to be preferred, on many occaſions, to ſoffits, or flat ceilings, as they give a greater riſe and elevation; and beſides, are more firm and durable. See Ceiling, Roof.

The antients, Salmaſius obſerves, had only three kinds of *vaults*: the firſt, *fornix*, made cradle-wiſe; the ſecond, *teſtudo*, tortoiſe-wiſe, called by the French, *cul de four*, or oven-wiſe; the third, *concha*, or ſhell-wiſe.

But the moderns ſubdivide theſe three ſorts into a great many more, to which they give different names, according to their figures and uſe: ſome are *circular*, others *elliptical*, &c.

The ſweeps of ſome, again, are larger, others leſs portions of a ſphere: all above hemiſpheres are called *high*, or *ſurmounted vaults*; all that are leſs than hemiſpheres, are *low*, or *ſurbaſed vaults*, &c.

In ſome, the heighth is greater than the diameter; in others, it is leſs: there are others, again, quite flat, only made with haunſes; others oven-like, or in form of a cul de four, &c. others growing wider, as they lengthen, like a trumpet.

Of *vaults*, ſome are *ſingle*, others *double*, *croſs*, *diagonal*, *horizontal*, *aſcending*, *deſcending*, *angular*, *oblique*, *pendent*, &c.—There are likewiſe *Gothic vaults*, with *pendentives*, &c. See Ogive, Pendentive, &c.

Maſter Vaults, are thoſe which cover the principal parts of buildings; in contradiſtinction to the *leſſer*, or ſubordinate *vaults*, which only cover ſome little part; as a paſſage, a gate, &c.

Double Vault, is ſuch a one as, being built over another, to make the exterior decoration range with the interior, leaves a ſpace between the convexity of the one, and the concavity of the other: as in the dome of S. Paul's at London, and S. Peter's at Rome.

Vaults *with Compartiments*, are ſuch whoſe ſweep, or inner face, is enriched with pannels of ſculpture, ſeparated by platbands: theſe compartiments, which are of different figures, according to the *vaults*, and uſually gilt on a white ground, are made with ſtucco, on brick-walls; as in the church of S. Peter's at Rome; and with plaiſter, on timber *vaults*.

Theory of Vaults.—A ſemicircular arch, or *vault*, ſtanding on two piedroits, or impoſts, and all the ſtones that compoſe them, being cut and placed in ſuch manner, as that their joints, or beds, being prolonged, do all meet in the centre of the *vault*; it is evident, all the ſtones muſt be in form of wedges, *i. e.* muſt be wider and bigger atop than at bottom: by virtue of which, they ſuſtain each other, and mutually oppoſe the effort of their weight, which determines them to fall.

The ſtone in the middle of the *vault*, which is perpendicular to the horizon, and is called the *key of the vault*, is ſuſtained on each ſide by the two contiguous ſtones, juſt as by two inclined planes: and of conſequence, the effort it makes to fall, is not equal to its weight.

But ſtill, that effort is greater, as the inclined planes are leſs inclined; ſo that, if they were infinitely little inclined, *i. e.* if they were perpendicular to the horizon, as well as the key, it would tend to fall with its whole weight; and would actually fall, but for the mortar.

The ſecond ſtone, which is on the right or left of the key-ſtone, is ſuſtained by a third; which, by virtue of the figure of the *vault*, is neceſſarily more inclined to the ſecond, than the ſecond is to the firſt; and of conſequence, the ſecond, in the effort it makes to fall, employs a leſs part of its weight than the firſt.

For the ſame reaſon, all the ſtones, reckoning from the key-ſtone, employ ſtill a leſs and leſs part of their weight to the laſt; which, reſiſting on a horizontal plane, employs no part of its weight; or, which is the ſame thing, makes no effort to fall; as being intirely ſupported by the impoſt.

Now, in *vaults*, a great point to be aimed at is, that all the vouſſoirs, or key-ſtones, make an equal effort in order to fall: To effect this, it is viſible, that as each (reckoning from the key to the impoſt) employs a ſtill leſs and leſs part of its whole weight; the firſt, for inſtance, only employing one half; the ſecond, one third; the third, one fourth, &c. there is no other way to make thoſe different parts equal, but by a proportionable augmentation of the whole, *i. e.* the ſecond ſtone muſt be heavier than the firſt; the third, than the ſecond, &c. to the laſt; which ſhould be infinitely heavier.

M. de la Hire demonſtrates what that proportion is, in which the weights of the ſtones of a ſemicircular arch muſt be increaſed, to be in equilibrio, or to tend with equal forces to fall; which is the firmeſt diſpoſition a *vault* can have.

Before him, the architects had no certain rule to conduct themſelves by; but did all at random. Reckoning the degrees of the quadrant of the circle from the key-ſtone to the impoſt; the extremity of each ſtone will take up ſo much the greater arch, as it is farther from the key.

M. de la Hire's rule is, to augment the weight of each ſtone above that of the key-ſtone, as much as the tangent of the arch of the ſtone exceeds the tangent of the arch of half the key.—Now, the tangent of the laſt ſtone, of neceſſity becomes infinite, and of conſequence its weight ſhould be ſo too: but as infinity has no place in practice, the rule amounts to this, that the laſt ſtones be loaded as much as poſſible, that they may the better reſiſt the effort which the *vault* makes to ſeparate them; which is called the *ſhoot*, or *drift of the vault*.

M. Parent has ſince determined the curve, or figure, which the extrados, or outſide of a *vault*, whoſe intrados, or inſide, is ſpherical, muſt have, that all the ſtones may be in equilibrio.

Key of a Vault, is a ſtone, or brick, in the middle of the *vault*, in form of a truncated cone, ſerving to bind or faſten all the reſt. See Key.

Reins, or *Fillings up of a* Vault, are the ſides which ſuſtain it.

Pendentive of a Vault, is the part ſuſpended between the arches or ogives. See Pendentive.

Impoſt of a Vault, is the ſtone whereon the firſt vouſſoir, or arch-ſtone of the *vault*, is laid. See Impost, &c.

Vault, or Volt, in manage. See Volt.

VAUNT, or Vant. See the article Van.

Vaunt-*Lay*, among hunters, a ſetting of hounds, or beagles, in readineſs where the chaſe is to paſs; and caſting them off before the reſt of the kennel come in. See Relay.

VAYVODE, or Vaivode. See the article Waywode.

UBIQUISTS,* Ubiquitaries, or Ubiquitarians, a ſect of Lutherans, which roſe and ſpread itſelf in Germany; and whoſe diſtinguiſhing doctrine was, that the body of Jeſus Chriſt is every where, or in every place. See Lutheranism.

* The word is formed from the Latin adverb, *ubique, every where*.

Brentius, one of the earlieſt reformers, is ſaid to have firſt broached this error, in 1560.—Melanchthon immediately declared againſt it; maintaining, that it introduced, with the Eutycheans, a kind of confuſion into the two natures of Jeſus Chriſt; and proteſted, that he would oppoſe it as long as he lived.

On the other hand, Andrew and Flacius Illyrius, Oſiander, &c. eſpouſed Brentius's party; and aſſerted the body of Jeſus Chriſt to be every where.

The univerſities of Leipſic and Wirtemberg, and the generality of Proteſtants, ſet themſelves againſt this new hereſy, but in vain: the *Ubiquitarians* grew ſtronger and ſtronger.—Six of their leaders, Schmidelin, Selneccer, Muſculus, Chemnitius, Chytræus, and Cornerus, having a meeting in 1577, in the monaſtery of Berg, they there compoſed a kind of credo, or formula of faith, wherein the *ubiquity* was eſtabliſhed as an article.

All the *Ubiquitiſts*, however, are not agreed: ſome of them, and among the reſt the Swedes, hold that Jeſus Chriſt, even during his mortal life, was every where: others maintain, that it is only ſince his aſcenſion that his body is every where.

G. Hornius only allows Brentius the honour of being the firſt propagator of *ubiquitiſm*; its firſt inventor, according to him, was John of Weſtphalia, a miniſter of Hamburg, in 1552.

Ubiquist, in the univerſity of Paris, is a term applied to ſuch doctors in theology, as are not reſtrained to any particular houſe; either to that of Navarre, or Sorbonne.

The *Ubiquiſts* are called, ſimply, *doctors in theology*; whereas the others add, *of the houſe of Sorbonne*, or *Navarre*, &c. See Sorbonne, Doctor, &c.

UBIQUITY, *Omnipreſence*; an attribute of the Godhead, whereby he is always intimately preſent to all things; gives the eſſe to all things; knows, preſerves, and does all in all things. See God.

For ſince God cannot be ſaid to exiſt in all places, as placed therein, (becauſe, then, he would need ſomething to his exiſtence, *viz.* place; and would have extenſion, parts, *&c.*) he muſt be conceived to be every where, or in all things, as a firſt, univerſal, efficient cauſe, in all his effects.

He is preſent, therefore, to all his creatures, as a pure act, or an exerciſe of an active virtue, which knows, preſerves, governs, *&c.* every thing.—Nor are, even finite minds, preſent otherwiſe than by operation. See PRESENCE.

UDDER, UBER, in comparative anatomy, that part in brutes wherein the milk is prepared; anſwering to the mammæ, or breaſts in the human kind. See BREAST, and MILK.

VECTIS, in mechanics, one of the powers; more uſually called *lever.* See LEVER.

Heterodromus VECTIS. See the article HETERODROMUS.

VECTOR, in aſtronomy, a line ſuppoſed to be drawn from any planet moving round a centre, or the focus of an ellipſis to that centre, or focus. See PLANET.

This, by ſome writers of the new aſtronomy, is called *vector*, or *radius vector*, becauſe it is that line by which the plant ſeems to be carried round its centre; and with which it deſcribes areas proportional to the times. See AREA, *&c.*

VEDETTE, in the military art, a ſentinel on horſeback, detached from the main body of the army, to diſcover and give notice of the enemy's deſigns.

VEER, a ſea term variouſly uſed.—*Veering out a rope*, denotes the letting it go by hand, or letting it run out of itſelf: thus, they ſay, *Veer more cable*; that is, let more run out.

But they do not uſe the word for the letting out of any running rope, except the ſheat.

VEER, is alſo uſed in reference to the wind: for when it changes often, and ſuddenly, they ſay, the *wind veers.*

When a ſhip under ſail, has her ſheat *veered* out, they ſay, *ſhe goes veering*; that is, at large; neither by a wind, nor directly before it, but between both: which they alſo call *quartering.* See WIND, and QUARTERING.

VEGETABLE, VEGETABILE, in phyſiology, a term applied to all plants, conſidered as capable of growth; *i. e.* all natural bodies which have parts organically formed for generation, and accretion, but not ſenſation. See PLANT.

In *vegetables*, there is ſuppoſed to be a principle of life, commonly called the *vegetative ſoul.* See VEGETATIVE, and VEGETATION.

Boerhaave very ſcientifically defines a *vegetable* to be a body generated of the earth; to which it adheres, or is connected, by parts called *roots*, through which it receives the matter of its nouriſhment, and increaſe; and conſiſts of juices, and veſſels, ſenſibly diſtinct from each other: or, a *vegetable* is an organical body, compoſed of veſſels and juices, every where diſtinguiſhable from each other; to which grow roots or parts, whereby it adheres to ſome other body, from which it derives the matter of its life, and growth.

This definition furniſhes a juſt and adequate idea of a *vegetable:* for by its conſiſting of veſſels and juices, it is diſtinguiſhed from a *foſſil*; and by its adhering to another body, and deriving its nouriſhment therefrom, it is diſtinguiſhed from an *animal.* See FOSSIL, and ANIMAL.

A *vegetable* is defined an organical body, becauſe conſiſting of different parts, which jointly concur to the exerciſe of the ſame function. See ORGANICAL.

Adhering by ſome of its parts to another body—for we know of no plant that is ſo abſolutely vague and fluctuating, but has ſtill a body it adheres to; though that body may be various, *e. gr.* earth, as in our common plants; ſtone, as in rock-plants; water, as in ſea-plants; and air, as in ſome mucilages.

As to thoſe few plants which appear to float with the water, their manner of growth is ſomewhat anomalous: M. Tournefort has ſhewn, that all plants do not ariſe ſtrictly from ſeeds; but that ſome, inſtead of ſemen, depoſite, or let fall a little drop of juice, which ſinking in the water, by its gravity reaches the bottom, or ſome rock, *&c.* in its way; to which it ſticks, ſtrikes root, and ſhoots into branches. Such is the origin of coral. See CORAL.

Add, that the root of a plant may have any ſituation at pleaſure, with reſpect to the body thereof; nor needs it either be loweſt or higheſt, *&c.*—Accordingly, in aloes, coral, moſſes, fungus's, *&c.* the root is frequently uppermoſt, and its growth downwards.

The vaſcular ſtructure of *vegetables*, is rendered very apparent, by an experiment of Mr. Willughby—Cutting off ſome pretty big branches of birch, and making a ſort of baſon, or reſervoir, on the end thereof with ſoft wax; upon filling this with water, and holding the branch upright, the water, in a few minutes, ſunk into the veſſels of the wood, and running quite through the length, dropped out conſiderably faſt; continuing ſo to do, as long as the water was poured on.—The ſame ſucceeds in a ſycamore, walnut-tree, *&c.* though the flux here is not ſo copious. *Philoſoph. Tranſact.* N° 70.

There are ſecrets whereby the growth of *vegetables* is ſurpriſingly promoted.—Mr. Boyle mentions a virtuoſo, who entertained his friends at the end of their meal with a ſallad of lettices, which he ſowed in their preſence, immediately before they ſat down to table.

The chymiſts alſo furniſh us with an extraordinary ſort of *vegetables:* as, the arbor Dianæ, arbor Martis, *&c.*—In effect, gold, ſilver, iron, copper, being prepared in aqua fortis, there riſes out of them a kind of tree, which vegetates, or grows, to the naked eye, and ſpreads into branches, leaves, *&c.* the whole heighth of the water; till all the matter is ſpent therein. See ARBOR *Dianæ*, &c.

This water, the chymiſts call *flint water*; the ſecret whereof has been communicated by Rhodocanaſſes, a Greek chymiſt.

VEGETABLE *Oil.* See the article OIL.

VEGETATION, VEGETATIO, the act whereby plants, and other living bodies, receive nouriſhment, and grow. See PLANT, VEGETABLE, ACCRETION, *&c.*

Plants, we learn from the microſcope, conſiſt of different parts, veſſels, *&c.* analogous to thoſe of animals: and each kind of veſſel is ſuppoſed to be the vehicle of a different humour, or juice, ſecreted from the maſs of ſap; which is conſidered as the blood, or common fund of them all. See SAP, and BLOOD.

Dr. Grew aſſigns the offices of the ſeveral veſſels: thoſe placed on the inner verge of the bark, he calls *lymphæducts*, and ſuppoſes them deſtined for the conveyance of the moſt aqueous, or watery liquor; theſe Mr. Bradley calls the *new forming veſſels*, which are annually produced, and help to increaſe the bulk of the tree.

Thoſe in the middle of the bark, Dr. Grew calls *lactiferous*, or *reſiniferous* veſſels; their uſe, according to Bradley, is to return the ſuperfluous ſap: theſe veſſels, Grew obſerves, are the principal viſcera of plants; and adds, that as the viſcera of animals are but veſſels conglomerated; ſo the veſſels of a plant are viſcera drawn out at length. See VISCERA.

To the nutrition of plants, as well as animals, it ſeems neceſſary that there be a concurrence of two ſpecifically diſtinct fluids; and a learned author maintains an intermixture of two ſuch humours in every part of a tree, like that which we obſerve in linſey-woolſey: every part of ſap being impregnated with other tinctures, and continually filtred from fibres of one kind to thoſe of another. From this mixture, many of the phænomena of the ripening, odours, colours, *&c.* are accounted for.

Theory of VEGETATION.—The proceſs of nature in the *vegetation* of plants, is very accurately delivered by the excellent Malpighi, to the effect following.

The egg (or ſeed) of the plant being excluded out of the ovary, (called *pod*, or *husk)* and requiring further foſtering and brooding; is committed to the earth. See SEED, and EGG.

There, that kind mother having received it into her boſom, not only does the office of incubation, by her own warm vapours and exhalations, joined with the heat of the ſun; but, by degrees, ſupplies what the ſeed requires for its further growth: as abounding every where with canals and ſinus's, wherein the dew, and rain-water, impregnated with fertile ſalts, glide, like the chyle and blood in the arteries, *&c.* of animals.

This moiſture meeting with a new depoſited ſeed, is percolated, or ſtrained through the pores or pipes of the outer rind, or huſk, (correſponding to the ſecundines of fœtus's) on the inſide whereof lie one or more, commonly two, thick ſeminal leaves, (anſwering to the placenta in women, and the cotyledons in brutes.) See SECUNDINE, PLACENTA, *&c.*

Theſe ſeed-leaves conſiſt of a great number of little veſiculæ, or bladders; with a tube, correſponding to the navel-ſtring in animals. See UMBILICUS.

In theſe veſiculæ is received the moiſture of the earth, ſtrained through the rind of the ſeed; which makes a ſlight fermentation with the proper juice before contained therein.

This fermented liquor is conveyed by the umbilical veſſel to the trunk of the little plant; and to the gem, or bud, which is contiguous thereto: upon which, a *vegetation* and increaſe of the parts ſucceeds.

Such is the procedure in the *vegetation* of plants; which the illuſtrious author exemplifies in a grain of wheat; as follows. —The firſt day the grain is ſown, it grows a little turgid; and the ſecundine, or huſk, gapes a little in ſeveral places: and the body of the plant, being continued by the umbilical veſſel to a conglobated leaf, (which is called the *pulp* or *fleſh* of the ſeed, and is what conſtitutes the flower) ſwells; by which means, not only the gem, or ſprout, (which is to be the future ſtem) opens, and waxes green; but the roots begin to bunch out; whence the placenta, or ſeed-leaf, becoming looſe, gapes.

The ſecond day the ſecundine, or huſk, being broke through, the ſtem, or top of the future ſtraw, appears on the outſide thereof, and grows upwards by degrees: in the mean time, the ſeed-leaf guarding the roots, becomes turgid with its veſiculæ; and puts forth a white down. And the leaf being pulled away, you ſee the roots of the plant bare; the future buds, leaves, and reſt of the ſtalk ſtill lying hid.— Between the roots, and the aſcending ſtem, the trunk of the plant is knit, by the navel-knot, to the flower-leaf; which is very moiſt, though it ſtill retains its white colour, and its natural taſte.

The third day, the pulp of the conglobated, or round leaf, becomes turgid with the juice which it received from the earth, fermenting with its own.

Thus the plant increaſing in bigneſs, and its bud or ſtem becoming taller, from whitiſh, turns greeniſh: the lateral roots alſo breaks forth greeniſh, and pyramidal from the gaping ſheath, which adheres cloſely to the plant; and the lower root grows longer, and hairy, with many fibres ſhooting out of the ſame.

Indeed there are hairy fibres hanging all along on all the roots, except on their tips; and theſe fibres are ſeen to wind about the ſaline particles of the ſoil, little lumps of earth, &c. like ivy; whence they grow curled. Above the lateral roots, there now break out two other little ones.

The fourth day, the ſtem mounting upwards, makes a right angle with the ſeminal leaf: The laſt roots put forth more; and the other three, growing larger, are cloathed with more hairs, which ſtraightly embrace the lumps of earth; and where they meet with any vacuity, unite into a kind of network.— The conglobate, or flower-leaf, is now ſofter; and, when bruiſed, yields a white ſweetiſh juice, like barley cream.— By ſtripping it off, the root and ſtem of the plant are plainly ſeen, with the intermediate navel-knot, whoſe outer part is ſolid, like a bark, and the inner more ſoft, and medullary.

The fifth day, the ſtalk ſtill riſing, puts forth a permanent, or ſtable leaf, which is green, and folded; the roots grow longer, and there appears a new tumor of a future root: the outer, or ſheath-leaf is looſened; and the ſeed-leaf begins to fade.

The ſixth day, the ſtable-leaf being looſened, the plant mounts upwards; the ſheath-leaf ſtill cleaving about it like a bark.— The ſeed-leaf is now ſeen ſinuous, or wrinkled, and faded: and this being cut or freed from the ſecundine, the fleſh, or pericarpium, is found of a different texture; the outer part, whereby the outſide of the ſeed or grain is heaved up, being more ſolid; but the inſide veſicular, and filled with humor, eſpecially that part next the navel-knot.— All the leaves being pulled off, the roots torn, and the flower-leaf removed, the trunk appears; wherein, not far from the roots, the navel-knot bunches out, which is ſolid, and hard to cut: above, there is the mark of the ſheath-leaf, which was pulled off; and underneath, as in an arm-pit, the gem is often hid. —The hind part of the plant, ſhews the breakings forth of the roots, likewiſe the faded placenta, &c.

After the eleventh day, the ſeed-leaf, as yet ſticking to the plant, is crumpled, and almoſt corrupted; within it is hollow; and about the ſecundine, the mucous, and white ſubſtance of the ſeed, being continued to the navel-knot, forms a cavity. All the roots becoming longer, put forth new branches out of their ſides: the ſeed-leaf withers, and its veſicles are emptied: the internodes, or ſpaces between the knots, grow longer; new gems appear; and the middle root grows ſeveral inches long.

After a month, the roots and ſtalk being grown much longer, new buds break out at the firſt knot, and little tumors bunch out, which, at length, break into roots.— *For other circumſtances of Vegetation*, ſee GENERATION, JUICE, SEED, RADICLE, PLUME, PERPENDICULARITY, PARALLELISM, &c.

As to the Vegetable Matter, or the food whereby plants grow, there is ſome doubt: the common opinion among naturaliſts, is, that water is the great *vegetable* food; which is confirmed by any eaſy experiment.

A ſprig of balm, mint, or the like plant, is ſet in a phial of pure water, without any mixture of earth; yet the ſprig grows, puts forth roots, leaves, and branches.

Agreeable to which, is another famed experiment of Van Helmont; who drying 200 pounds of earth, and planting a willow which weighed 5 pounds therein, he watered it only with rain, or diſtilled-water; and to ſecure it from any other earth, covered it with a perforated tin cover: at 5 years end, weighing the tree, with all the leaves it had born in that time, he found it to weigh 169 pounds 3 ounces; yet the earth was only diminiſhed 2 ounces. See WATER.

To aſcertain this point, Dr. Woodward has made ſome very good experiments; which, at the ſame time, give light to many other circumſtances of *vegetation*.— His experiments are moſt of them made with ſprigs of mint, and ſome other plants, nicely weighed, and incloſed in equal glaſs phials, well covered up with parchment; leaving only room for the ſtems to aſcend through it; and filled with water: ſome with ſpring-water, others with rain-water, others with Thames-water.

At the end of 77 days he took them all out again; weighed them, as alſo the water left; and computed the weight of water expended on them, and the proportion of the increaſe of the plant, to the expence of the water.

The next year, *viz.* 1692, he made freſh experiments with the ſame phials, and the ſame ſort of plants, weighed as before, only ſome were filled with Hyde-Park conduit-water alone, others with the ſame water and a certain proportion of garden-earth diſſolved in it; and others in the ſame water diſtilled.

At the end of 56 days, he weighed the plants, water, &c. and computed what each plant had gained, what quantity of water was expended on the plant, and the proportion of the increaſe of the plant, to the decreaſe of the water.

The reſult of all which experiments, he gives us in the following obſervations, and reflections.— 1°. In plants of the ſame kind, the leſs they are in bulk, the ſmaller quantity of the fluid maſs, in which they are ſet, is drawn off.— The conſumption, where the maſs is of equal thickneſs, being pretty nearly proportional to the bulk of the plant.

In effect, the water ſeems to aſcend up the veſſels of plants, in much the ſame manner as up a filtre: and it is no great wonder, that the larger filtre ſhould draw off more water than the ſmaller; or that a plant, that hath no more and larger veſſels ſhould take up a greater ſhare of the fluid, in which it is ſet, than one that has fewer can: nor is this noted as a thing very conſiderable in itſelf, but chiefly with regard to what follows.

2°. Much the greater part of the fluid maſs thus drawn off, and conveyed into the plant, does not ſettle or abide there; but paſſes through their pores, and exhales up into the atmoſphere.— That the water, in theſe experiments, aſcended only through the veſſels of the plants, is certain; ſince ſome glaſſes, which had no plants in them, though diſpoſed in like manner as the reſt, remained at the end of the experiment as at firſt, without any diminution of water: and that the greater part of it flies off from the plant, into the atmoſphere, is as certain.

The leaſt proportion of the water expended, was to the augment of the plant, as 46 or 50 to 1; and in ſome 100, 200, nay, in one, as 700 to 1.

This ſo continual an emiſſion of water, in ſo great plenty, from the parts of the plant, affords a manifeſt reaſon, why countries that abound with trees, and the larger vegetables eſpecially, ſhould be very obnoxious to damps, great humidity in the air, and more frequent rains, than others that are more open and free.— The great moiſture in the air, was a great inconvenience, and annoyance to thoſe who firſt ſettled in America; which, at that time, was overgrown with woods and groves: but as theſe were burned and deſtroyed, to make way for habitations, and culture of the earth; the air mended, changed into a temper much more ſerene and dry than before.

Nor does this humidity go off pure, and alone, but uſually carries with it many parts of the ſame nature, with thoſe whereof the plant, through which it paſſes, conſiſts: the craſſer, indeed, are not ſo eaſily born up into the atmoſphere, but are uſually depoſited on the ſurface of leaves, flowers, and other parts of the plants; whence our mannas, our honies, and other gummous exudations of vegetables: but the finer and lighter parts, are with greater eaſe ſent up into the atmoſphere; thence they are conveyed to our organs of ſmell, by the air we draw in reſpiration; and are pleaſant or offenſive, beneficent or injurious to us, according to the nature of the plants from which they ariſe.— And ſince theſe owe their riſe to the water that aſcends out of the earth, through the bodies of plants; we cannot be far to ſeek for the cauſe, why they are more numerous in the air, and a greater quantity of odours is found exhaling from vegetables, in warm humid ſeaſons, than in any others.

3°. A great part of the terreſtrial matter that is mixed with water, aſcends up into the plant, as well as the water. —There was much more terreſtrial matter, at the end of the experiment, in the water of the glaſſes that had no plants in them, than in thoſe which had plants.— The garden-mould diſſolved in ſome of the glaſſes, was conſiderably diminiſhed, and carried off; nay, the terreſtrial and vegetable matter, was born up in the tubes filled with ſand, cotton, &c. in that quantity, as to be evident, even to ſenſe: and the bodies in the cavities of the other tubes, that had their lower ends immerſed in water, wherein ſaffron, cochineal, &c. had been infuſed, were tingled with yellow, purple, &c.—To look abroad a little towards our ſhores, and parts within the verge of the ſea, theſe will preſent us with a large ſcene of plants, that, along with the vegetable, take up into them mere mineral matter alſo, in great abundance; ſuch as our ſea-purſlain, the ſeveral ſorts of algas, of ſamphires, and other marine plants: thoſe contain common ſea-ſalts, which are the ſame as the foſſil, in ſuch plenty, as not only plainly to be diſtinguiſhed on the palate, but may be drawn out of them in conſiderable quantity; nay, ſome affirm, there are plants found, that will yield nitre, and other mineral ſalts.

The vegetable matter being very fine and light, is ſurprizingly apt, and diſpoſed to attend water in all its motions, and follow it into each of its receſſes; as appears not only from the inſtances above alledged, but many others: percolate it with all the care imaginable, filtre it with never ſo many filtrations, yet ſome terreſtrial matter will remain.—Dr. Woodward has filtred water through ſeveral ſheets of thick paper, and after that, through very cloſe fine cloth, twelve times doubled; and this over and over, and yet a conſiderable quantity of this matter diſcovered itſelf in the water, after all.—Now if it thus paſſes interſtices that are ſo very ſmall and fine, along with the water, it is the leſs ſtrange, it ſhould attend in its paſſage through the ducts and veſſels of plants: it is true, filtring and diſtilling the water, intercepts, and makes it quit ſome of the earthy matter it was before impregnated withal; but then, that which continues with the water after this, is fine and light, and ſuch, conſequently, as is, in a peculiar manner, fit for the growth and nouriſhment of vegetables.—And this is the caſe of rain-water: the quantity of terreſtrial matters it bears up into the atmoſphere, is not great; but what it does bear up, is chiefly of that light kind, or vegetable matter, and that, too, perfectly diſſolved, and reduced to ſingle corpuſcles, all fit to enter the tubules, and veſſels of plants: on which account it is, that this water is ſo very fertile and prolific.

The reaſon why all the terreſtrial matter mixed with the water, does not aſcend into the plant, is, that the mineral matters makes a great deal of it, which is not only groſs and ponderous, but ſcabrous and inflexible; and ſo not diſpoſed to enter the pores of the roots: beſides, a great many of the ſimple vegetable particles, by degrees, unite, and form ſmall clods, or moleculæ, which ſtick to the extremities of the roots of thoſe plants; and others of them, entangled in a looſer manner, from the nubeculæ, or green bodies, ſo commonly obſerved in ſtagnant water: theſe, when thus conjoined, are too big to enter the pores, or aſcend up the veſſels of plants; which ſingly they might have done.

Hence it is, that in agriculture, be the earth never ſo rich, good, and fit for the production of corn, or other vegetables; little will come of it, unleſs the parts of it be ſeparated and looſe: and it is on this account, ſuch pains are beſtowed in the digging, tilling, ploughing, fallowing, harrowing, and breaking the clodded lumps of earth: and it is the ſame way that ſea-ſalt, nitre, and other ſalts, promote *vegatation.*

Some authors imagine nitre eſſential to plants; and that nothing in the vegetable kingdom is tranſacted without it: but Dr. Woodward aſſures us, that by all the trials he has been able to make, the thing ſeems to him quite otherwiſe: and when contiguous to the plant, nitre rather deſtroys than nouriſhes it.—But nitre, and other ſalts, certainly looſen the earth, and ſeparate the concreted parts thereof; by that means, fitting and diſpoſing them to be aſſumed by the water, and carried up into the ſeed or plant, for its formation and increaſe.—It is every body's obſervation, how apt all ſorts of ſalts are to be wrought upon by moiſture, how eaſily they run with it; and when theſe are drawn off, and have deſerted the lumps wherewith they were incorporated, thoſe muſt moulder immediately, and fall aſunder of courſe: the hardeſt ſtone we meet with, if it happen, as it frequently doth, to have any ſort of ſalt intermixed with the ſand of which it conſiſts, upon its being expoſed to a humid air, in a ſhort time diſſolves and crumbles all to pieces; and much more will clodded earth, or clay, which is not of ſo compact and ſolid a conſtitution.

The ſame way is lime likewiſe ſerviceable in *vegetation:* the huſbandmen ſay, it does not fatten, but only mellows the ground: by which they mean, it doth not contain any thing in itſelf, that is of the ſame nature with the vegetable mould, or afford any matter fit for the formation of plants, but merely ſoftens, and relaxes the earth; by that means, rendering it more capable of entering the ſeeds of vegetables ſet in it, in order to their nouriſhment, than otherwiſe it would have been.—The properties of lime are well known, and how apt it is to be put in a ferment, and commotion by water; nor can ſuch commotion ever happen, when lime is mixed with earth, however hard and clodded that may be, without opening and looſening it.

4°. The plant is more or leſs nouriſhed, in proportion as the water in which it ſtands contains a greater or ſmaller quantity of proper terreſtrial matter in it.—The truth of this propoſition is decernable through the whole proceſs of this author's experiments.—The mint in one of his glaſſes, was of much the ſame bulk and weight with that of two or three others: but the water in which the firſt was, being river-water, which was apparently ſtored more copiouſly with terreſtrial matter, than the ſpring or rain-water, wherein the others ſtood, occaſioned it to arrive at almoſt double the bulk that either of them had, and with a leſs expence of water too: ſo likewiſe the mint in another glaſs, in whoſe water was diſſolved a ſmall quantity of good garden-mould; though it had the diſadvantage to be leſs, when firſt ſet, than either of the mints in two other glaſſes, whoſe water was the very ſame with the firſt, only had none of the earth mixed with it; yet, in a ſhort time, the plant not only overtook, but much outſtripped the others.

The reaſon why the proportion of the increaſe of the plant is limited to the quantity of proper terreſtrial matter in the water, is, that all even vegetable matter, is not proper for the nouriſhment of every plant: nor do there want good indications, that every kind of vegetable requires a peculiar and ſpecific matter for its formation and nouriſhment; yea, each part of the ſame vegetable: and that there are very many and different ingredients to go to the compoſition of the ſame individual plant.—If, therefore, the ſoil wherein any vegetable or ſeed is planted, contains all, or moſt of theſe ingredients, and thoſe in due quantity, it will grow and thrive there; otherwiſe it will not: if there be not as many ſorts of corpuſcles, as are requiſite for the conſtitution of the main, and more eſſential parts of the plant, it will not proſper at all; if there are theſe, and not in ſufficient plenty, it will never arrive to its natural ſtature: or, if there be any the leſs neceſſary and eſſential corpuſcles wanting, there will be ſome failure in the plant; it will be defective in taſte, ſmell, colour, or ſome other way.

Indeed, it is inconceivable how one uniform, homogeneous matter, having its principles, or original parts of the ſame ſubſtance, conſtitution, magnitude, figure, and gravity, ſhould conſtitute bodies ſo unlike in all thoſe reſpects, as vegetables of different kinds are; nay, even as the different parts of the ſame vegetable: that one ſhould carry a reſinous, another a milky, a third a yellow, a fourth a red juice in its veins; one afford a fragrant, another an offenſive ſmell; one ſweet to the taſte, another acid, bitter, acerb, auſtere, *&c.* that one ſhould be nouriſhing, another poiſonous; one purging, another aſtringent —And this argument makes equally ſtrong againſt thoſe who ſuppoſe mere water the matter out of which all bodies are formed.—A cataputia in one of the glaſſes received but little increaſe, only 3 ½ grains all the while it ſtood, though 2501 grains of water were ſpent upon it: but this might poſſibly be owing, not to the water's wanting matter fit for the nouriſhment of that particular plant, but to the water's being an improper medium for it to grow in: too much of that liquor, in ſome plants, may probably hurry the terreſtrial matter through the veſſels too faſt for them to lay hold of it.

But a farther proof of this doctrine is, that the ſoil once proper for the production of ſome ſort of vegetable, does not ever continue to be ſo; but, in tract of time, loſes its property; and ſooner in ſome lands, and later in others: If wheat, for example, be ſown upon land proper for that grain, the firſt crop will ſucceed very well, and perhaps the ſecond, and the third, as long as the ground is in heart, as the farmers call it; but in a few years it will produce no more, if ſowed with that corn: ſome other grain it may, as barley; and after this has been ſown ſo oft, that the land can bring forth no more of it, it may afterwards yield ſome good oats; and perhaps peaſe after them.—At length it becomes barren; the vegetative matter that at firſt it abounded with, being reduced by the ſucceſſive crops, and moſt of it born off: each ſort of grain takes forth that peculiar matter, that is proper for its own nouriſhment.

It may be brought to bear another ſeries of the ſame vegetables; but not till it is ſupplied with a new fund of matter, of the like ſort with what it firſt contained; either by the ground's lying fallow for ſome time, till the rain has poured a freſh ſtock upon it; or by the manuring it.—That this ſupply is of the like ſort, is evident from the ſeveral manures found beſt to promote the *vegetation*; which are, chiefly, either parts of vegetables, or of animals: of animals, we ſay, which either derive their own nouriſhment immediately from vegetable bodies, or from other animals that do ſo; in particular, the blood, urine, and excrements of animals; ſhavings of horns, and hoofs; hair, wool, feathers, calcined ſhells, lees of wine and beer, aſhes of all ſorts of vegetable bodies, leaves, ſtraw, roots, and ſtubble, turned into earth by ploughing, or otherwiſe, to rot and diſſolve there.—Theſe are our beſt manures; and being vegetable ſubſtances, when refunded back again into the earth, ſerve for the formation of other like bodies. See MANURING, and COMPOST.

The like is obſervable in gardens, where the trees, ſhrubs, and herbs, after their continuing in one ſtation, till they have derived thence the greater part of the matter fit for their increaſe, will decay, and degenerate; unleſs either freſh earth, or ſome fit manure be applied to them: it is true they may maintain themſelves there for ſome time, by ſending forth roots farther and farther, to an extent all around, to fetch in more proviſion; but, at laſt, they muſt have a freſh ſupply brought to them, or they themſelves be removed or tranſplanted to ſome place better furniſhed with matter for their ſubſiſtence.—And accordingly, gardeners obſerve, that plants that have ſtood a long while in a place, have longer root than uſual; part of which they cut off, when they tranſplant to a freſh ſoil, as not now of any farther uſe to them.

All theſe inſtances point forth a peculiar terreſtrial matter, and not water, for the ſubject to which plants owe their increaſe: were it water only, there would be no need of manures, or tranſplanting; the rain falls in all places, in this field and that, indifferently; on one ſide of an orchard or garden, as well as another: nor could there be any reaſon, why a tract of land ſhould yield wheat one year, and not the next, ſince the rain ſhowers down alike on each.

5°. Vegetables then are not formed of water, but of a certain peculiar terreſtrial matter.—A little diſtillation ſhews, that there is a conſiderable quantity of this matter contained both in rain, ſpring, and river-water: and the experiments above-mentioned, ſhew that the much greateſt part of the fluid maſs that aſcends up into plants, does not ſettle or abide there, but paſſes through the pores of them, and exhales into the atmoſphere; and that a great part of the terreſtrial matter, mixed with the water, paſſes up into the plant along with it; and that the plant is more or leſs augmented, in proportion, as the water contains a greater or ſmaller quantity of that matter: from all which, we may reaſonably infer, that earth, and not water, is the matter that conſtitutes vegetables.

One of the ſprigs of mint drew up into it 2501 grains of the fluid maſs, and yet had received but $3\frac{1}{2}$ grains of increaſe from it: a ſecond, though it had at firſt the diſadvantage to be much leſs than the third, yet, being ſet in water wherewith earth was plentifully mixed, and the other in water without any ſuch earth, it had vaſtly outgrown it; weighing, at leaſt, 145 grains more than the former: a fourth plant, though at firſt a great deal leſs than the fifth, yet being ſet in the foul craſs-water, that was firſt in the ſtill, after that in which the laſt was ſet was drawn off, had gained in weight, at the end, above double what that in the finer and thinner water had.—The proportion of the augment of that plant which throve moſt, was to the fluid maſs ſpent upon it, but as 1 to 46; in others, as 1 to 60, 100, 200; and in the cataputia, but as 1 to 714.—One of the ſprigs took up 39 grains of water a day, one day with another; which was much more than the whole plant originally, and yet it gained not $\frac{1}{4}$ of a grain a day in weight: and another took up 253 grains a day, which was near twice as much as its original weight; and after all, the daily increaſe of the plant was no more than $2\frac{15}{36}$ grains.

6°. Spring and rain-water contain near an equal charge of vegetable matter; river-water more than either of them.—Theſe proportions hold in the main, but a ſtrict and juſt compariſon is hardly to be expected; inaſmuch as in all probability, the water that falls in rain, contains at ſome times a greater ſhare of terreſtrial matter, than that which falls at other times; a more powerful and intenſe heat, of neceſſity, hurrying up a larger quantity of that matter, along with the humid vapours that form rain, than one more feeble and remiſs poſſibly can.—The water of one ſpring may flow forth with an higher charge of this matter, than that of another: this depending partly upon the quickneſs of the ebullition of the water, and partly upon the quantity of that matter latent in the ſtrata, through which the fluid paſſes, and the greater or leſs laxity of thoſe ſtrata: for the ſame reaſon the water of one river may abound with it, more than that of another; nay, the ſame river, when much agitated, and in commotion, muſt tear up of more of it, than when it moves with leſs rapidity, and violence.—That there is a greater quantity of this matter in rivers, and that it contributes vaſtly to the ordinary fertility of the earth, we have an illuſtrious inſtance in the Nile, the Ganges, and other rivers, that yearly overflow the neighbouring plains: their banks ſhew the faireſt and largeſt crops of any in the world.

7°. Water ſerves only for a vehicle to the terreſtrial matter which forms vegetables, and does not itſelf make any addition to them.—Where the proper terreſtrial matter is wanting, the plant is not augmented, though never ſo much water aſcend into it: water, then, is not the matter that compoſes vegetable bodies; it is only the agent that conveys the matter to them, and diſtributes it to their ſeveral parts for their nouriſhment: that matter is ſluggiſh and inactive, and would lie eternally confined to its beds of earth, without advancing up into plants, did not water, or ſome like inſtrument, fetch it forth, and carry it into them.

This fluid is capacitated for the office here aſſigned it, ſeveral ways: by the figure of its parts, which, as appears from many experiments, is exactly and mathematically ſpherical; their ſurfaces being perfectly polite, and without any the leaſt irregularities. It is evident, corpuſcles of ſuch a figure are eaſily ſuſceptible of motion, and far above any others whatever; and conſequently the moſt capable of moving and conveying other matter that is not ſo active: then, the intervals of bodies of that figure, are, with reſpect to their bulk, of all others, the largeſt, and ſo the moſt fitted to receive and entertain foreign matter in them; beſides, as far as the trials hitherto made inform us, the conſtituent corpuſcles of water are each ſingly conſidered, abſolutely ſolid, and do not yield to the greateſt external force: this ſecures their figure againſt any alteration, and the intervals of the corpuſcle muſt be always alike.—By the latter, it will be ever diſpoſed to receive matter into it; and by the former, when once received, to bear it along with it.—Water is farther capacitated to be a vehicle to this matter, by the tenuity and fineneſs of the corpuſcles of which it conſiſts: we hardly know any fluid in all nature, except fire, whoſe conſtituent parts are ſo exceeding ſubtile, and ſmall, as thoſe of water are: they will paſs pores and interſtices, that neither air, nor any other fluid will.—This enables them to enter the fineſt tubes and veſſels of plants, and to introduce the terreſtrial matter, conveying it into all parts of them; whilſt each, by means of organs it is endued with for the purpoſe, intercepts, and aſſumes into itſelf ſuch particles, as are ſuitable to its own nature, letting the reſt paſs on through the common ducts.

8°. Water is not capable of performing this office to plants, unleſs aſſiſted by a due quantity of heat.—This muſt concur, or *vegetation* will not ſucceed.—The plants ſet in the glaſſes in October, and the following colder months, had not near the quantity of water ſent up into them, or ſo great an additional increaſe by much, as thoſe that were ſet in June, July, and the hotter months.—It is plain, water has no power of moving itſelf, or riſing to the vaſt heighth it does, in the more tall and lofty plants; ſo far from it, that it doth not appear from any diſcovery yet made, that even its own fluidity conſiſts in the inteſtine motion of its parts, whatever the Carteſians think.—Indeed, we need nothing more to ſolve all the phænomena of fluidity, than ſuch a figure, and diſpoſition of parts, as water has: ſpherical corpuſcles muſt ſtand ſo very tickliſh upon each other, as to be ſuſceptible of every impreſſion; and though not perpetually in motion, muſt be always ready and liable to be put into it, by any the ſlighteſt force imaginable: it is true, the parts of fire, or heat, are not capable of moving themſelves, any more than thoſe of water; but they are more ſubtile, light, and active than thoſe are, and ſo more eaſily put into motion. See FLUIDITY.

That the concurrence of heat in this work is really neceſſary, appears not only from the experiments before us, but from all nature; from the fields and foreſts, gardens and orchards: we ſee in autumn, as the ſun's power is gradually leſs and leſs, ſo its effect on plants is remitted, and *vegetation* ſlackens by little and little.—Its failure is firſt decernable in trees; which being raiſed higheſt above the earth, require a more intenſe heat, to elevate the water, charged with nouriſhment, to their tops; ſo that for want of freſh ſupport and nutriment, they ſhed their leaves, unleſs ſecured by a firm and hard conſtitution indeed, as our ever-greens are: next, the ſhrubs part with theirs; and then the herbs, and lower tribes: the heat, being, at length, not ſufficient to ſupply even theſe, though ſo near the earth, and the fund of their nouriſhment.—As the heat returns the ſucceeding ſpring, they all recruit again, and are furniſhed with freſh ſupplies and verdure: but firſt, thoſe which are loweſt and neareſt the earth, and that require a leſſer degree of heat to raiſe the water with its earthy change unto them: then the ſhrubs, and high vegetables, in their turns; and laſtly, the trees.—As the heat increaſes, it grows too powerful, and hurries the matter with too great rapidity, through the finer and more tender plants; theſe, therefore, go off, and decay; and others that are more hardy and vigorous, and require a greater degree of heat, ſucceed in their order.—By which mechaniſm, provident nature furniſhes us with a very various and differing entertainment; and what is beſt ſuited to each ſeaſon all the year round.

As the heat of the ſeveral ſeaſons affords us a different face of things, ſo the ſeveral diſtant climates ſhew the different ſcenes of nature, and productions of the earth.—The hotter countries ordinarily yield the largeſt and talleſt trees, and thoſe, too, in a much greater variety than the colder; even thoſe plants common to both, attain to a much greater bulk in the ſouthern, than the northern climes: nay, there are ſome regions ſo cold, that they raiſe no vegetables at all to a conſiderable ſize; this we learn from Greenland, Iceland, and other places of like cold ſituation and condition: in theſe there are no trees, and the ſhrubs are poor, little, and low.—Again, in the warmer climates, and ſuch as do furniſh trees, and the large vegetables, if there happen a remiſſion or diminution of the uſual heat, their productions are impeded in proportion: our cold ſummers gives us proof enough of this; for though, at ſuch times, the heat we have is ſufficient to raiſe the vegetative matter into the lower plants, our corns, wheat, barley, peaſe, and the like; and we have plenty of ſtrawberries, raſpberries, gooſeberries, currants, and the fruits of ſuch vegetables as are low and near the earth; and a moderate ſtore of cherries, mulberries, plums, &c. and ſome others that grow at ſomewhat greater heighth; yet our apples, pears, walnuts, and the productions of the taller trees, have been fewer, and thoſe not ſo thoroughly ripened, and brought to that perfection, as they are in more benign and warm ſeaſons: and indeed, in trees of the ſame kind; thoſe that keep cloſe to the earth, always produce the moſt and beſt fruit: for which reaſon it is, that the gardeners check and reſtrain the growth of their better fruit-trees, and prevent their running up to too great a heighth.— As to our grapes, apricots, peaches, nectarins, and figs, they being tranſplanted hither out of hotter countries, it is the leſs wonder we have a failure of them in cold ſummers.— Nor is it the ſun, or the ordinary emiſſion of the ſubterranean heat only, that promotes *vegetation*, but any other indifferently, according to its power and degree; as we find from our ſtoves, hot-beds, *&c.* See HEAT, COLD, WATER, EARTH, SOIL, TREE, DWARE, HOT-BED, *&c.*

VEGETATIVE, VEGETATIVUS, a term applied to that principle, or part in plants, by virtue whereof they receive nouriſhment, and grow, or vegetate. See VEGETATION.

The philoſophers ſpeak of three kinds of ſouls, the *vegetative*, *ſenſitive*, and *rational.* See SOUL.

The *vegetative* ſoul, is that principle whereby trees and plants live, grow, produce their kind, *&c.* See PLANT.

This *vegetative* principle is differently ſeated in different plants: an ingenious author obſerves, that, generally ſpeaking, its place is exactly between the trunk, and root; at leaſt, this appears to be the place in moſt of the ſeminiferous tribe; which, if cut down near the place, rarely ſhoot again.

In other plants, as the elm, and many edible plants, it ſeems to reſide wholly in the roots; which, if cut into ever ſo many parts, yet, thoſe being planted in the ground, ſoon grow. See ROOT, and PLANTING.

In others, as the willow kinds, it ſeems to be diffuſed all over, both root, trunk, and branches; inſomuch, that if cut into a thouſand pieces, there is no deſtroying them without ſplitting them in the middle; and ſcarcely then. See FECUNDITY.

Laſtly, in others, as the cereus's, ficus's, *&c.* it is ſeated in the body, branches, and leaves; any of which being put into the ground, ſtrike root immediately, and grow.

The office of this *vegetative* principle, is to concoct the indigeſted earth and ſalts which aſcend through the roots; and to aſſimilate them to the nature of the plant. See VEGETATION.

VEHICLE, VEHICULUM, in its literal ſenſe, ſignifies ſomewhat that carries, or bears a thing along. See CARRIAGE, WAGGON, WHEEL, *&c.*

Thus, in anatomy, the ſerum is ſaid to be the *vehicle* that conveys the globules of the blood. See BLOOD.

In pharmacy, any liquid ſerving to dilute another with, or to adminiſter it in, more agreebly to a patient, is called a *vehicle.*

Water is the *vehicle* of the nutritious matter of the vegetables. See VEGETATION, and WATER.

VEIL, VELUM, a piece of ſtuff, ſerving to hide, or prevent the ſight of any thing.

In this ſenſe, we read of a large *veil*, or curtain, in the temple of Jeruſalem, miraculouſly rent at the paſſion of our Saviour. In the Romiſh churches, in time of Lent, they have *veils*, or curtains, over the altar, crucifix, images of the ſaints, *&c.*

VEIL, is alſo uſed for a large piece of crape, wore on the head by nuns; as the badge of their profeſſion.— Whence, to *take the veil*, ſignifies to commence religious. See PROFESSION.

The novices wear white *veils*; and thoſe who have made the vows, black *veils.* See NOVICE.

The prelate before whom the vows are made, bleſſes the *veil*, and gives it the religious. See RELIGIOUS, *&c.*

VEIN, VENA, in anatomy, a name given to ſeveral veſſels, or canals, which receive the blood from the divers parts of the body, to which the arteries had conveyed it from the heart; and carry it back to the heart again.— See *Tab. Anat.* (*Angeiol.*) *fig.* 6, 7. ſee alſo BLOOD, *&c.*

The *veins* are only a continuation of the extreme capillary arteries, reflected back again towards the heart. See CAPILLARY, and ARTERY.

In their progreſs, uniting their channels as they approach the heart, they, at laſt, all form three large *veins*, or trunks, *viz.* The *vena cava deſcendens*; which brings the blood back from all the parts above the heart.— The *vena cava aſcendens*; which brings the blood from all the parts below the heart.— And the *porta*, which carries the blood to the liver. See CAVA, HEART, PORTA, *&c.*

The anaſtomoſis, or inoſculation of the *veins* and arteries, was firſt ſeen by the microſcope, in the feet, tails, *&c.* of frogs, and other amphibious animals, by Leewenhoeck; but has ſince been obſerved in other animals, particularly the omentum of a cat, by Mr. Cowper, *&c.* See ANASTOMOSIS, CIRCULATION, *&c.*

The coats of the *veins* are four, the ſame with thoſe of the arteries; only the muſcular coat is thin in all the *veins*, as it is in the capillary arteries; the preſſure of the blood againſt the ſides of the *veins*, being leſs than that againſt the ſides of the arteries, becauſe the force of the heart is much broke in the capillaries.— See *Tab. Anat.* (*Angeiol.*) *fig.* 7. *a. a. b. b. c. d.* ſee alſo the article PHLEBOTOMY.

In the *veins* there is no pulſe, becauſe the blood is thrown into them with a continual ſtream, and becauſe it moves from a narrow channel to a wider.— But they have a periſtaltic motion, which depends on their muſcular coat. See PULSE, *&c.*

The *capillary veins* unite with one another, as has been ſaid of the capillary arteries; only their courſe is directly oppoſite: for inſtead of a trunk diſtributed into branches and capillaries, a *vein* is a trunk, formed out of a concourſe of capillaries. See CAPILLARY.

In all the *veins*, which are perpendicular to the horizon, excepting thoſe of the uterus, and the porta, there are ſmall membranes, or valves; ſometimes there is only one, ſometimes there are two, and ſometimes three, placed together, like ſo many half thimbles ſtuck to the ſides of the *veins*, with their mouths towards the heart.

Theſe, in the motion of the blood toward the heart, are preſſed cloſe to the ſides of the *vein*; but ſhut the *veins*, againſt any reflux of the blood that way from the heart, and thereby ſuſtain the weight thereof in the great trunks. See VALVE.

The *veins* are diſtinguiſhed, with reſpect to their ſituation, into *ſuperior*, and *inferior*, *aſcending*, and *deſcending*; *right*, as the meſenteric, and *left*, as the ſplenic branch; *internal*, as the baſilica; and *external*, as the humeral.

Many of them, likewiſe, acquire denominations from the parts wherein they are found; as, the *jugulars*, *phrenitic*, *renal*, *iliac*, *hypogaſtric*, *epigaſtric*, *axilliary*, *crural*, *umbilical*, *ſural*, *ſciatica*, *ſaphena*, *mediana*, *cephalic*, *thoracic*, *ſubclavian*, *intercoſtal*, *coronal*, *diaphragmatic*, *hæmorrhoidal*, *cervical*, *thymal*, *mammillary*, *gaſtric*, *ſtomachic*, *epiploic*, *ſplenic*, &c.

They are alſo diſtinguiſhed from their particular offices, into *ſpermatic*, *emulgent*, &c. all which ſee exhibited in *Tab. Anatomy*, (*Angeiol.*)— and their particular deſcriptions under their proper article JUGULAR, PHRENITIC, &c.

VEIN is alſo applied to the ſtreaks, or waves of divers colours, appearing on ſeveral ſorts of woods, ſtones, *&c.* as if they were really painted; and which the painters frequently imatate in painting wainſcots, *&c.*

Marble is generally full of ſuch *veins.* See MARBLE.— Lapis lazuli has *veins* like gold. See LAPIS.— Ovid, ſpeaking of the metamorphoſes of men into ſtones, ſays,— *Quæ modò vena fuit, ſub eodem nomine manſit.*

Veins, in ſtones, are a defect, proceeding uſually from an inequality in their conſiſtence, as to hard, and ſoft; which makes the ſtone crack, and ſhiver in thoſe parts.

VEIN is alſo applied, in the ſame ſenſe with *ſtratum*, to the various diſpoſitions and kinds of earth met withal in digging. See STRATUM.

Thus, we ſay, a *vein* of ſand, another of rock, *&c.* a *vein* of ocher, vitriol, allom, calamine, coal, *&c.*—Mineral waters acquire their different qualities, by paſſing through *veins* of vitriol, ſulphur, *&c.* See MINERAL.

In the ſame ſenſe, we ſay, a *vein* of gold, ſilver, quickſilver, *&c.* meaning certain parts of the earth, wherein the oar or glebe of thoſe metals is found; and which is diſtributed into divers branches, like the *veins* in the body. See ORE, MINE, *&c.*

Tavernier gives us a deſcription of the *veins* in the diamond mines in Golconda, with the manner of digging them. See DIAMOND.

In digging of coal-pits, they meet with a variety of *veins*, the order, *&c.* of which, is different, in different places: in the *Philoſophical Tranſactions*, N°. 360. the *veins* in thoſe famous coal-mines at Mendip, in Somerſetſhire, are obſerved to be, (below the turf, or loam, or malm, a reddiſh fireſtone; the coal clives, which is blackiſh rock) the *ſtinking vein*, a hard coal for mechanic uſes; five feet below which, is the *catſhead vein*, 22 feet thick, intermixed with lumps of ſtone; at a like diſtance below which, is the *three-coal vein*, divided into three kinds of coal, and about three feet thick.

The *veins* hitherto mentioned, are frequently worked in the ſame pit.— The next is the *peaw vein*, which is intermixed with cockle-ſhells, and fern-branches, uſually wrought in a ſeparate pit: though its depth below the *three-coal vein* be only above five feet, yet the cliff between is very hard, and liable to water: this *vein* is about a yard thick; and the like diſtance below it, is the *ſmith's-coal vein*: beneath which, is the *ſhelly vein*; and under that, a *vein* of 10 inches, little worth, and ſeldom wrought. See COAL.

The ſame *veins* are found in a place 7 or 8 miles apart.— All the *veins* lie obliquely, or ſhelving, like the ſide of a houſe: the obliquity, or *pitch*, as they term it, is about 22 inches in a fathom; which, when it riſes to the land, is called *crop*, and in ſome places *baſſeting.*

In digging to the ſouth-weſt, they oft meet with ridges, which cauſe the *vein* to *trap up*; i. e. being cut off by the ridges, they find it over their heads, when they are through the ridge: on the contrary, working through a ridge to the north-eaſt, they ſay, it *traps down*, i. e. they find it under their feet.

VEJOURS, Visores, in law, are thoſe ſent by the court, to take view of any place in queſtion, for the better deciſion of the right. See View.

It is alſo uſed for thoſe ſent to view ſuch as eſſoign themſelves *de malo lecti*; whether, in truth, they be ſuch as that they cannot appear, or whether they counterfeit. See Essoign, Viewer, &c.

VELAMEN, is uſed by ſome ſurgeons, for the bag, ſkin, or bladder of an impoſthume, or ſwelling. See Cystis, Tumor, Abscess, &c.

VELAMENTUM *Bombycinum*, a name which ſome anatomiſts give to the velvet membrane, or inner ſkin of the inteſtines. See Intestines.

VELARIUS, in antiquity, an officer in the court of the Roman emperors; being a kind of uſher, whoſe poſt was behind the curtain, *vela*, in the prince's apartment; as that of the chancellor's was at the entry of the baluſtrade, *cancelli*; and that of the *oſtiarii* at the door.

The *velarii* had a ſuperior, of the ſame denomination, who commanded them; as we find in two inſcriptions, quoted by Salmaſius, in his notes on Vopiſcus; and by a third in Gruter.—The firſt is,

D. M.
TI. CL. HALLUS
PRÆPOSITUS VELARIORUM
DOMUS AUGUSTANAE
FEC. SIBI ET FILIIS SUIS L. L.
POST. EORUM.

Salmaſius, and others, for HALLUS, which is in the ſtone whereon the inſcription is at Rome, put THALLUS: though we find mention of the ſame Hallus, as a Samaritan by nation, and Tiberius's freedman, in Joſephus; which ſhews that the *velarii*, and their chief, were very antient officers, and in uſe among the firſt emperors.

VELITES, in the Roman army, a kind of antient ſoldiery, who were armed lightly with a javelin, a caſk, cuiraſſe, and ſhield. See Triarii.

VELLEITY, Velleitas, in the ſchool philoſophy, is uſually defined a languid, cold, and remiſs will. See Will. Others ſay, it implies an impotency of obtaining what we require.— Others will have it, a ſlight deſire for ſomething, which a perſon does not matter much, or is too indolent to ſeek: as, *catus amat piſcem, ſed non vult tangere lympham.*

VELLICATION, among phyſicians, the act of twitching. —The word is more particularly applied to a ſort of ſudden convulſions, that happen to the fibres of the muſcles. See Fibre, and Convulsion.

VELOCITY, in mechanics, *ſwiftneſs*; that affection of motion, whereby a moveable is diſpoſed to run over a certain ſpace in a certain time. See Motion.

It is alſo called *celerity*; and is ſtill proportional to the ſpace moved.—The greateſt *velocity* wherewith a ball can deſcend, by virtue of its ſpecific weight, in a reſiſting medium, is that which the ſame ball would acquire by falling in an unreſiſting medium, though a ſpace which is to four thirds of its diameter, as the denſity of the ball to the denſity of the fluid. See Descent.

Huygens, Leibnitz, Bernoulli, Wolfius, and the foreign mathematicians, hold, that the momenta, or forces of falling bodies, at the end of their falls, are as the ſquares of their *velocities* into the quantity of matter; the Engliſh mathematicians, on the contrary, maintain them to be as the *velocities* themſelves, into the quantity of matter. See Momentum.

Velocity is conceived, either as *abſolute*, or *relative*: the *velocity* we have hitherto conſidered, is *ſimple*, or *abſolute*, with reſpect to a certain ſpace, moved in a certain time.

Relative, or *reſpective velocity*, is that wherewith two diſtant bodies approach each other, and come to meet in a longer, or leſs time: whether only one of them moves, towards the other at reſt, or whether they both move; which may happen two ways; either by two bodies mutually approaching each other in the ſame right line, or by two bodies moving the ſame way in the ſame line, only the foremoſt ſlower than the other; for by this means, this will overtake that. And, as they come to meet, in a greater or leſs time, the *relative velocity* is greater or leſs.

Thus, if two bodies come nearer each other by two feet, in one ſecond of time; their reſpective *velocity* is double that of two others, which only approach one foot in the ſame time.

Velocities *of bodies moving in Curves*.— According to Galileo's ſyſtem of the fall of heavy bodies, now admitted by all philoſophers, the *velocities* of a body falling vertically, are, each moment of its fall, as the roots of the heighths from whence it has fallen; reckoning from the beginning thereof. Hence that author gathered, that if a body fall along an inclined plane, the *velocities* it has at the different times, will be in the ſame ratio: for ſince its *velocity* is all owing to its fall, and it only falls as much as there is perpendicular heighth in the inclined plane; the *velocity* would be meaſured by that heighth, as much as if it were vertical.

The ſame principle, likewiſe, led him to conclude, that if a body fall through two contiguous inclined planes, making an angle between them, much like a ſtick when broke, the *velocity* would be regulated after the ſame manner, by the vertical heighth of the two planes taken together: for it is only this heighth it falls; and from its fall it has all its *velocity*.

The concluſion was univerſally admitted, till the year 1693, when M. Varignon demonſtrated it to be falſe: from his demonſtration, it ſhould ſeem to follow, that the *velocities* of a body falling along the cavity of a curve, for inſtance, of a cycloid, ought not to be as the roots of the heighths; ſince a curve is only a ſeries of an infinity of infinitely little contiguous planes, inclined towards one another. So that Galileo's propoſition would ſeem to fail in this caſe too, and yet it holds good; only with ſome reſtriction.

All this mixture of truths and errors, ſo near akin to each other, ſhewed that they had got not hold of the firſt principles; M. Varignon, therefore, undertook to clear what related to the *velocities* of falling bodies; and to ſet the whole matter in a new light: he ſtill ſuppoſes Galileo's firſt ſyſtem, that the *velocities*, at the different timeof a vertical fall, are as the roots of the correſpondent heighths.— The great principle he makes uſe of to attain his end, is that of compound motion. See Composition *of Motion*.

If a body fall along two contiguous inclined planes, making an obtuſe angle, or a kind of concavity between them; M. Varignon ſhews, from the compoſition of thoſe motions, that the body, as it meets the ſecond plane, loſes ſomewhat of its *velocity*; and, of conſequence, that it is not the ſame at the end of the fall, as it would be, had it fell through the firſt plane prolonged: ſo that the proportion of the roots of the heighths aſſerted by Galileo, does not here obtain.

The reaſon of the loſs of *velocity*, is, that the motion, which was parallel to the firſt plane, becomes oblique to the ſecond, ſince they make an angle: this motion, which is oblique to the ſecond plane, being conceived as compounded, that part perpendicular to the plane, is loſt, by the oppoſition thereof, and part of the *velocity* along with it: conſequently, the leſs of the perpendicular there is in the oblique motion, or, which is the ſame thing, the leſs the two planes are from being one, *i. e*, the more obtuſe the angle is, the leſs *velocity* does the body loſe.

Now, all the infinitely little, contiguous, inclined planes, whereof a curve conſiſts, making infinitely obtuſe angles among themſelves, a body falling along the concavity of a curve, the loſs of *velocity* it undergoes each inſtant, is infinitely little: but a finite portion of any curve, how little ſoever, conſiſting of an infinity of infinitely little planes, a body moving through it, loſes an infinite number of infinitely little parts of its *velocity*: and an infinity of infinitely little parts, makes an infinity of a higher order, *i. e.* an infinity of an infinitely little parts makes a finite magnitude, if they be of the firſt order, or kind; and an infinitely little quantity of the firſt order, if they be of the ſecond; and ſo in infinitum.— Therefore, if the loſſes of *velocity* of a body falling along a curve, be of the firſt order, they will amount to a finite quantity in any finite part of the curve, &c. See Curve.

The nature of every curve is abundantly determined, by the ratio of the ordinates, to the correſpondent portions of the axis; and the eſſence of curves in general, may be conceived as conſiſting in this ratio, which is variable a thouſand ways.— Now this ſame ratio will be likewiſe that of two ſimple *velocities*, by whoſe concurrence a body will deſcribe any curve: and, of conſequence, the eſſence of all curves in the general, is the ſame thing as the concourſe, or combination of all the forces, which, taken two by two, may move the ſame body.— Thus we have a moſt ſimple, and general equation, of all poſſible curves, and all poſſible *velocities*. See Curve.

By means of this equation, as ſoon as the two ſimple *velocities* of a body are known, the curve, reſulting from them, is immediately determined.— It is obſervable, that on the foot of this equation, an uniform *velocity*, and a *velocity* that always varies according to the roots of the heighths, produce a parabola, independent of the angle made by the two projectile forces that give the *velocities*: conſequently, a cannon ball, ſhot either horizontally, or obliquely to the horizon, muſt always deſcribe a parabola.— The beſt mathematicians, hitherto, had much ado to prove, that oblique projections formed parabolas, as well as horizontal ones. See Projectile, and Parabola.

To have ſome meaſure of *velocity*, the ſpace is to be divided into as many equal parts, as the time is conceived to be divided into: for the quantity of ſpace, correſponding to that diviſion of time, is the meaſure of the *velocity*.

For an inſtance; ſuppoſe the moveable A, (*Tab. Mechanics, fig.* 40.) travel a ſpace of 80 feet, in 40 ſeconds of time;

dividing 80 by 40, the quotient 2 ſhews the *velocity* of the moveable to be ſuch, as that it paſſes over an interval of two feet in one minute: the *velocity*, therefore, is rightly expreſſed by $\frac{40}{80}$; that is, by 2.

Suppoſe, again, another moveable, B, which, in 30 ſeconds of time, travels 90 feet; the index of the celerity will be 3. Wherefore, ſince in each caſe the meaſure of the ſpace is a foot, which is ſuppoſed every where of the ſame length; and the meaſure of time a ſecond, which is conceived every where of the ſame duration: the indices of the *velocities* 2 and 3, are homogeneal: and therefore, the *velocity* of A, is to the *velocity* of B, as 2 to 3.

Hence, if the ſpace be $=ſ$, and the time $=t$, the *velocity* may be expreſſed by $ſ:t$; the ſpace being in a ratio of the time, and the *velocity*. See MOTION.

Circular VELOCITY.	See the article	CIRCULAR.
Meaſure of VELOCITY.		MEASURE.

VELOCITY *of Wind*, *of Light*, *Sound*, &c. See WIND, LIGHT, SOUND, *&c.*

VELOM*, a kind of parchment, finer, evener, and whiter than the common parchment. See PARCHMENT.

* The word is formed from the French *velin*, of the Latin *vitellinus*, belonging to a calf.

Abortive VELOM. See the article ABORTIVE.

VELVET*, a rich kind of ſtuff, all ſilk, covered on the outſide with a cloſe, ſhort, fine, ſoft ſhag; the other ſide being a very ſtrong, cloſe tiſſue. See PLUSH.

* The word is formed of the French *velours*, which ſignifies the ſame; and which comes from *velu*, a thing covered with hair.

The nap or ſhag, called alſo the *velveting*, of this ſtuff, is formed of part of the threads of the warp, which the workman puts on a long narrow channelled ruler, or needle; and which he afterwards cuts, by drawing a ſharp ſteel tool along the channel of the needle, to the ends of the warp.

The principal and beſt manufactories of *velvet* are in France and Italy, particularly at Venice, Milan, Florence, Genoa, and Lucca: there are others in Holland, ſet up by the French refugees; whereof, that at Haerlem is the moſt conſiderable: but theſe all come ſhort of the beauty of thoſe in France; and, accordingly, are ſold for 10 or 15 *per cent.* leſs.— There are even ſome brought from China, but they are the worſt of all.

There are *velvets* of various kinds, as—*plain*, that is, uniform and ſmooth, without either figures or ſtripes.

Figured VELVET, that is, adorned and worked with divers figures; though the ground be the ſame with the figures; that is, the whole ſurface *velveted*. See FIGURED.

Ramage, or *branched* VELVET, repreſenting long ſtalks, branches, *&c.* on a ſattin ground, which is ſometimes of the ſame colour with the *velvet*, but more uſually of a different one.—Sometimes, inſtead of ſattin, they make the ground of gold and ſilver; whence the denominations of *velvets with gold ground*, &c.

Shorn VELVET, is that wherein the threads, that make the *velveting*, have been ranged in the channelled ruler, but not cut there.

Striped VELVET, is that wherein there are ſtripes of divers colours, running along the warp; whether thoſe ſtripes be partly *velvet*, and partly ſattin, or all *velveted*.

Cut VELVET, is that wherein the ground is a kind of taffety, or gros de Tours, and the figures *velvet*.

Velvets are likewiſe diſtinguiſhed, with regard to their different degrees of ſtrength and goodneſs, into *velvets* of four threads, three threads, two threads, and a thread and half: the firſt are thoſe where there are eight threads of ſhag, or *velveting*, to each tool of the reed; and the ſecond have only ſix, and the reſt four.

In general, all *velvets*, both worked and cut, ſhorn and flowered, are to have their warp and ſhag of organſin, ſpun and twiſted, or thrown in the mill; and their woof of ſilk well boiled, *&c.* They are all of the ſame breadth.

VENA, VEIN, in anatomy. See the article VEIN.

VENA *Cava.* See the article CAVA.

VENA *Porta*, &c.—See *Tab. Anat. (Splench.) fig.* 5. *lit. i*; ſee alſo the article PORTA, *&c.*

VENA *Pulmonis.* See the article PULMONARY.

VENÆ-SECTIO, the opening of a vein; called alſo *phlebotomy*; and popularly, *bleeding*. PHLEBOTOMY, *&c.*

VENÆ *Lacteæ.*	See the article	LACTEAL.
VENÆ *Lymphaticæ.*		LYMPHATIC.
VENÆ *Præputii*, &c.		PREPUCE.

VENAL, or VENOUS, among anatomiſts, ſomething that bears a relation to a vein. See VEIN.

The extremities of the cava and pulmonary veins, where they enter the auricles of the heart, are called *venous ſinus's*. See CAVA, and PULMONARY; ſee alſo HEART, and CIRCULATION.

VENAL*, VENALIS, is alſo uſed for ſomething bought with money, or procured by bribes.

* The word is formed from the Latin, *venalis*, to be ſold.

Thus, we ſay, *venal* bards; courtezans, and flatterers are *venal*; juſtice in Turky is *venal*; it muſt be bought of the baſhaws.

In England, there are ſeveral offices in the revenue, policy, &c. *venal*: but this *venality* of offices is no where ſo conſiderable, as in France; where all offices of judicature are bought of the king, and only municipal officers are elected. See OFFICE.

Offices, in England, are *venal* only by a kind of connivance; in France, it is a thing ſolemn, and authorized.—The *venality* was firſt introduced by Louis XII. who, to clear thoſe immenſe debts contracted by his predeceſſor Charles VIII. without burthening his people with new taxes, bethought himſelf to ſell the offices; and, in reality, made a vaſt ſum thereby.

Francis I. made an advantage of the ſame expedient to get money, and ſold his poſts openly: under the ſame king, it was only accounted a kind of loan; but that loan was no more than a name to diſguiſe a real ſale.—The parliament not being able to reliſh the *venality* of offices, always made the buyer take an oath, that he did not buy his poſt, either directly or indirectly; but there was a tacit exception made, of monies lent the king for being put into them.—At length, the parliament finding its oppoſitions were in vain, and that the traffic of offices were publickly authorized, aboliſhed the oath in 1597.

VENDEE, in law, the perſon to whom any thing is ſold; in contradiſtinction to *vendor*, or the ſeller.

VENDITIONI *Exponas*, is a judicial writ, directed to the ſheriff; commanding him to ſell goods, which he has formerly, by commandment, taken into his hands; for the ſatisfying a judgment given in the king's court.

VENEERING, VANEERING, or FINEERING, a kind of marquetry, or inlaying; whereby ſeveral thin ſlices, or leaves of fine wood, of different kinds, are applied and faſtened on a ground of ſome common wood. See MOSAIC.

There are two kinds of inlaying; the one, which is the more ordinary, goes no further than the making of compartiments of different woods; the other requires a deal more art, and repreſents flowers, birds, and the like figures.

The firſt kind is what we properly call *veneering*; the latter we have already deſcribed under the article MARQUETRY.

The wood intended for *veneering*, is firſt ſawed out into ſlices or leaves about a line thick: in order to ſaw them, the blocks or planks are placed upright, in a kind of ſawing-preſs:—The deſcription whereof may be ſeen under the article PRESS.

Theſe ſlices are afterwards cut into narrow ſlips, and faſhioned divers ways, according to the deſign propoſed: then the joints being carefully adjuſted, and the pieces brought down to their proper thickneſs, with ſeveral planes for the purpoſe; they are glued down on a ground, or block of dry wood, with good ſtrong Engliſh glue.

The pieces thus jointed and glued, the work, if ſmall, is put in a preſs; if large, it is laid on the bench, covered with a board, and preſſed down with poles, or pieces of wood, one end thereof reaches to the cieling of the room, and the other bears on the board.

When the glue is quite dry, they take it out of the preſs, and finiſh it; firſt with little planes, then with divers ſcrapers; ſome whereof reſemble raſps, which take off the dents, *&c.* left by the planes.

When ſufficiently ſcraped, the work is poliſhed with the ſkin of a ſea-dog, wax, and a bruſh and poliſher of ſhave-graſs: which is the laſt operation.

VENELLIS. See VICIS *&* *Venellis mundandis.*

VENEREAL, ſomething belonging to Venus. See VENUS.

A *venereal* perſon, is one addicted to *venery*, or *venereal* pleaſures.—*Venereal medicines*, are called *aphrodiſiacs*, *provocatives*, &c.

VENEREAL *Diſeaſe*, *Lues* VENEREA, the *French diſeaſe*, *foul diſeaſe*, *French pox*, or *great pox*, is a contagious malady, contracted by ſome impure humour, generally received in coition; and diſcovering itſelf in ulcers and pains about the genital and other parts. See POX.

It is uſually ſaid to have made its firſt appearance in Europe in the year 1493; though others will have it much older, and contend for its being known to the antients, only under other names.

Mr. Becket, particularly, has attempted to ſhew, that it is the ſame with what among our forefathers was called the *leproſy*; and which, in many of our antient Engliſh writings, charters, *&c.* is called *brenning*, or *burning*.

In order to prove his point, he has ſearched the records relating to the ſtews antiently kept on the Bankſide, Southwark, under the juriſdiction of the biſhop of Wincheſter. See STEWS.

Among other conſtitutions of theſe ſtews, dated 1162, it was appointed, "That no ſtew-holder ſhould keep any woman "that hath the perillous infirmity of BURNING." And in another vellom manuſcript, now in the cuſtody of the biſhop of Wincheſter, dated 1430, it is again ordered, "That no

" ſtew-holder keep any woman within his houſe that hath any " ſickneſs of Brenning, but that ſhe be putte out, upon " the peyne of making a fine unto the lord of a hundred ſhillings." See Burning.

To confirm this account, Mr. Becket quotes a deſcription of the diſeaſe from a manuſcript of John Arden, Eſq; ſurgeon to king Richard II. and king Henry IV. Arden defines the diſeaſe called *brenning*, *incendium*, to be a certain inward heat and excoriation of the urethra: which definition, Mr. Becket obſerves, gives us a perfect idea of what we now call a *clap*; agreeable to the lateſt and moſt exact anatomical diſcoveries, and free of all the errors of Platerus, Rondeletius, Bartholin, Wharton, and other later writers on this diſeaſe. See Clap, and Gonorrhæa.

As to the leproſy being the ſame with this *venereal diſeaſe*, it muſt be owned, there are a good many ſymptoms in the one diſeaſe, which quadrate well enough with thoſe in the other; but then the ſymptoms in each are ſo precarious, that a great deal of ſtreſs cannot be laid hereon. See Leprosy.

The common tradition is, that the *venereal diſeaſe* firſt broke out in the French army, when it lay encamped before Naples; and that it was owing to ſome unwholeſome food: on which account, the French call it the *Neapolitan diſeaſe*; and the Italians, the *mal Franceſe*.

But others go much higher, and ſuppoſe it to be the ulcer Job complained of ſo grievouſly: and accordingly, in a *Miſſal* printed at Venice in 1542, there is a maſs in honour of S. Job, to be ſaid by thoſe recovered of this diſeaſe; as being ſuppoſed to owe their deliverance to his interceſſion.

But the opinion which prevails moſt among the more knowing of our phyſicians, is, that the diſeaſe is of Indian extraction; and that it was brought hither by the Spaniards from the American iſlands, where it was very common, beſore ever the Spaniards ſet footing there: whence the Spaniards call it *ſarva des India*, or *las buvas*: notwithſtanding what Herrera ſays, that the Spaniards carried it to Mexico, inſtead of bringing it thence.

Liſter, and others, take it to have had its firſt riſe from ſome of the ſerpentine kind; either from a bite thereof, or from ſome of their fleſh taken as food: this is pretty certain, that men bitten or ſtung by ſcorpions, are greatly eaſed by coition; but the woman, Pliny aſſures us, receives a deal of damage thereby: which is no ſlender argument of the diſeaſe's ariſing from ſome perſon ſo poiſoned.

Liſter adds, there is no room to doubt, but that the lues aroſe from ſome ſuch cauſe; for upon any venomous bite, the penis becomes vehemently extended; and the patient being ſeized with a ſatyriaſis, breaths nothing but rage, and luſt: nature, in effect, ſeeming to direct him to coition for a remedy.

But what proves a remedy to the wounded perſon, proves a diſeaſe to the woman: and from women thus infected, other men, who have to do with them, become infected in their turns; and thus has the diſeaſe been propagated.

The firſt ſymptoms generally ariſing after an affair with an infected perſon, are a heat, ſwelling, and inflammation about the penis, or vulva, with a hotneſs of urine.

The ſecond or third day uſually brings on a gonorrhæa, or dripping, which denominates it a *clap*; and which, in a few days more, is followed by a chordee. See Gonorhræa, and Chordee.

Though ſometimes there is no gonorrhæa, or clap; but the poiſon rather makes its way, through the cutis, to the groin; and there raiſes buboes, with various malignant puſtules in all parts of the body. See Bubo.

Sometime, alſo, there happen callous ulcers, called *ſhankers*, in the ſcrotum and perinæum; and ſometimes a cancerous and callous ulcer between the prepuce and glans; and in ſome the teſticles ſwell. See Shanker.

Add to theſe, violent nocturnal pains, nodes, heats in the palms of the hands, and ſoals of the feet; and hence fiſſures, excoriations, condylomata, *&c.* about the anus; falling of the hair; ruddy, yellow, or livid ſpots; hoarſeneſs, relaxation, and eroſion of the uvula, ulcers of the palate, ozæna, tingling of the ears, deafneſs, blindneſs, itch, conſumption, *&c.*—But it is rare all theſe ſymptoms happen to the ſame perſon.

The *venereal diſeaſe*, Sydenham obſerves, is communicated by copulation, lactation, handling, ſaliva, ſweat, the genital mucus, and the breath: and in whatever part it is received, it there diſcovers itſelf firſt.—When the infection is received along with the milk from the nurſe, it commonly ſhews itſelf in ſoreneſs and ulcers of the mouth.

The method of cure is various, according to the various ſymptoms, and ſtages: for the firſt ſtage, *viz.* a gonorrhæa virulenta, or clap, ſee Clap, and Gonorrhæa.

Dr. Pitcairn's method is this:—After two or three vomits, he directs mercurius dulcis, for ſome days, twice a day; when the mouth grows ſore, let alone the mercury for three or four days, and purge every other day. As the mouth grows well again, repeat the uſe of mercury; and thus alternately, till the ſymptoms ceaſe. See Mercury.

For a confirmed lues, mercurial ſalivation is generally held the only effectual cure: though mercurial frictions, applied in ſuch quantity, and at ſuch intervals, as not to raiſe a ſalivation, are held by ſome to be not only eaſier and ſafer, but even more ſucceſsful, in this diſeaſe, than ſalivation itſelf. See Salivation.

Dr. Sydenham tells us, he uſes to ſalivate immediately, without any preliminary evacuation, or preparation of the body at all.—His method is this: he preſcribes an unguent of ℥ii of axung. porcin. *i.e.* ſwines-ſeam, and ℥i of mercury. With a third part of this, he orders the patient to anoint his arms and legs, for three nights ſucceſſively, with his own hands; ſo as not to touch either the arm-pits, the groin or the abdomen.—After the third unction, the gums uſually ſwell, and a ptyaliſm comes on.—If it does not come in the time, he directs turbith mineral gr. viii. in conſerve of red roſes; which occaſioning a vomiting, raiſes the ptyaliſm.—And if, afterwards, the ſalivation abate, ere the ſymptoms are quite diſappeared, he orders it to be promoted with a freſh doſe of mercurius dulcis.—The diet, and other regimen, to be the ſame as in a catharſis.

VENERIS *Oeſtrum, the ſtimulus or incentive of venery*; is an appellation given, by ſome anatomiſts, to the clitoris. See Clitoris.

Veneris *Oeſtrum*, is alſo uſed by others for the tranſport of love, or the utmoſt ecſtaſy of deſire, or enjoyment in coition. See Orgasm.

Some are of opinion, that infectious women are the moſt apt to communicate the poiſon, when they are thus excited with deſire; whereas, with indifference, they may admit the ſame intercourſe, without giving the infection.

Veneris *Ens*. See the article Ens.

VENERY*, is uſed for the act of copulation, or coition of the two ſexes. See Coition, and Generation.

* It takes its name from *Venus*, the ſuppoſed deity of the paſſion of love.

Venery, alſo denotes the arts or exerciſe of hunting wild beaſts; which are alſo called *beaſts of venery*, and *beaſts of foreſt*. See Hunting.

Such are the hare, hart, hind, boar, and wolf. See Beast.

VENEW. See the article Venue.

VENIA*, among our antient writers, denotes a kneeling, or low proſtration to the ground; uſed by penitents. Genuflexion.

* Walſingham, p. 196. *Rege interim proſtrato in longa* venia.—*Per* venias *centum verrunt barbis pavimentum.*

VENIAL, a term in the Romiſh theology, applied to ſlight ſins, and ſuch as eaſily obtain pardon. See Sin.

In confeſſing to the prieſt, people are not obliged to accuſe themſelves of all their *venial* ſins.—The thing that gives the greateſt embarras to the Romiſh caſuiſts, is to diſtinguiſh between *venial* and mortal ſins.

The Reformed reject this diſtinction of *venial* and *mortal* ſins; and maintain, that all ſins, how grievous ſoever, are *venial*; and all ſins, how ſlight ſoever, are mortal: And the reaſon they urge is, that all ſins, though of their own nature mortal, yet become *venial*, or pardonable, by virtue of our Saviour's paſſion, to all ſuch that fulfil the conditions on which it is offered in the goſpel.—To which the Romaniſts anſwer, That the chief of theſe conditions is confeſſion. See Confession, and Absolution.

VENIRE *Facias*, in law, is a judicial writ, lying where two parties plead, and come to iſſue; directed to the ſheriff, to cauſe twelve men of the ſame neighbourhood to meet to try the ſame, and ſay the truth upon the iſſue taken. See Twelve-men, and Venue.

If this inqueſt comes not at the day of the writ returned; then ſhall go an habeas corpus, and after that a diſtreſs, until they come.

Venire *Facias tot Matronas*. See Ventre *Inſpiciendo*.

VENISON*, Vinaison, the fleſh of beaſts of game, or of animals to be caught in the way of game, *i. e.* by hunting, *&c.* as deer, hare, *&c.* See Game.

* The word is French, *venaiſon*; formed of the Latin *venatio*, hunting. See Hunting.

Beaſts of **Venison**. See the article Beast.

VENOM, Venenum. See the article Poison.

The terms *venom* and *poiſon* only differ from each other in this, that the latter is more frequently uſed where the noxious matter is taken inwardly, as in foods, drinks, *&c.* and the former, where it is applied outwardly, as in ſtings and bites of ſerpents, ſcorpions, vipers, ſpiders, *&c.*

The pike is ſaid to have a *venomous* tooth.—All *venomous* beaſts in the general, have that quality in a greater degree, when bred in mountainous and dry places, than when in wet and marſhy places; the ſouthern more than the northern; thoſe hungry and enraged, than others; and in ſummer more than winter. See Viper.

VENOUS, Venosus, See the article Venal.

VENOUS *Artery*, *Arteria* VENOSA. See ARTERY, LUNGS, CIRCULATION, &c.

VENT*, VENT-HOLE, or *Spiracle*, a little aperture left in the tubes, or pipes of fountains, to facilitate the air's eſcape; or, on occaſion, to give them air; as in froſty weather, &c. for want of which they are apt to burſt. See FOUNTAIN.

* The word is formed from the Latin *ventus*, wind.

A *vent*, taken in this ſenſe, is properly the end of a pipe, placed erect, and reaching above ground; uſually ſoldered to the turns, or elbows of pipes.— The *vents* of large pipes, are to be as high as the ſuperficies of the reſervoir; unleſs there be a valve in them.

VENT is alſo uſed for a little hole, pierced in veſſels of wine, beer, &c. that are on tap; and which admits air enough to make the liquor run, but not ſo much as to corrupt and ſpoil it.

VENT, again, is applied to the covers in wind-furnaces, whereby the air enters, which ſerves them for bellows; and which are ſtopped with regiſters, or ſlices, according to the degree of heat required; as in the furnaces of glaſs-houſes, eſſayers, &c. See BELLOWS, FURNACE, &c.

VENT is alſo uſed for a pipe of lead, or potter's ware; one end whereof opens into the cell of a neceſſary houſe, and the other reaches to the roof of the houſe; to give room for the corrupt fetid air to exhale.

There are alſo *vents*, or apertures made in the walls which ſuſtain terraſſes, to furniſh air, and give a paſſage for the waters.

This kind of *vent* the Italians, and we from them, call a *barbacane*. See BARBACANE.

Port-VENT. See the article PORT-*Vent*.

VENTER, *Belly*, in anatomy, a cavity in the body of an animal, containing viſcera, or other organs neceſſary for the performance of divers functions. See BODY, VISCERA, &c.

Phyſicians divide the human body into three *venters*, regions, or cavities; the firſt, the *head*, containing the brain, &c. See HEAD, and BRAIN.

The ſecond, the *breaſt*, or *thorax*, as far as the diaphragm, containing the organs of reſpiration. See THORAX, LUNGS, &c.

The third, which is what we more commonly call the *venter*, or *belly*, is that wherein the inteſtines, and the organs of generation and digeſtion are contained; called by anatomiſts the *abdomen*. See ABDOMEN.

VENTER, or *Belly*, is alſo popularly uſed for the exterior part of the lower *venter*.— In which ſenſe, we ſay, the navel is in the middle of the *venter*, &c.

VENTER is alſo uſed for the ventricle, or ſtomach; becauſe that part is incloſed in the cavity thereof. See VENTRICLE.— In this ſenſe it is, that Jonas is ſaid in ſcripture to have been three days in the whale's belly.

VENTER is alſo uſed for the womb, or uterus of women.— and hence the writ *de ventre inſpiciendo*. See VENTRE *Inſpiciendo*.

Hence, alſo, in the civil law, we ſay, *partus ſequitur ventrem*, the child follows the belly; meaning that its condition is either free or ſervile, according to that of its mother. See MARRIAGE.

They alſo ſay, to *appoint a curator for the belly*, with regard to poſthumous children, yet in the mother's womb. See POSTHUMOUS.— With regard to princes, the *venter*, or belly has been ſometimes crowned, in form.

VENTER is alſo uſed, in ſpeaking of a partition of the effects of a father and mother, among children born, or accruing from different marriages.

This partiton is ſo ordered, as that a ſingle child of one marriage, or *venter*, takes as much as ſeveral of another marriage, or *venter*: in order to which, the eſtate is divided into ſo many parts, as there have been *venters*, or marriages.

VENTER is alſo uſed for the children, whereof a woman is delivered at one pregnancy.— Thus, two twins are ſaid to be of the ſame *venter*.

Many people take for a fable, what is related of the counteſs of Holland, *viz.* that ſhe had 365 children at one *venter*, all living and baptized: and yet the ſtory is very gravely related by abundance of authors; and the font, or baſon, is ſtill ſhewn in the church where they were baptized; with a kind of monument of the fact inſcribed thereon. See FOETUS.

VENTER, or *belly* of a muſcle, is the fleſhy, or body part thereof; as contradiſtinguiſhed from the two tendons, its extreams; one whereof is called the *head*, and the other the *tail* of the muſcle. See MUSCLE.

VENTER *Draconis*, *Dragon's belly*, in aſtronomy, denotes the middle of a planet's orbit; or that part moſt remote from the nodes, *i. e.* from the dragon's head and tail; being the part which has the greateſt latitude, or is at the greateſt diſtance from the ecliptic. See ORBIT, and NODE.

There are two points under this denomination, in each orbit: that towards the ſouth, is alſo called the *ſouthern limit*, and that towards the north, the *northern limit*. See LIMITS.

The moon has 5 degrees of latitude, when in the dragon's belly; and is 90 degrees diſtant from the nodes. See LATITUDE.

VENTER *Equi*, *Horſe's belly*, among chymiſts, denotes horſe-dung, or a dunghil, wherein are incloſed certain veſſels for particular operations, to be performed by means of the gentle heat thereof. See FIRE, HEAT, BATH, &c.

VENTIDUCTS, in building, are ſpiracles, or ſubterraneous places, where freſh, cool winds being kept, are made to communicate, by means of tubes, funnels, or vaults, with the chambers, or other apartments of a houſe; to cool them in ſultry weather.

Theſe are much in uſe in Italy, where they are called *ventidotti*.— Among the French they are denominated *priſons des vents*, and *palais d' Eole*. See BUILDING, HOUSE, &c.

VENTOSA *Spina*. See the article SPINA *Ventoſa*.

VENTOSITY, in medicine. See the article FLATUS.

VENTRE *Inſpiciendo*, a writ for the ſearch of a woman that ſays ſhe is with child, and thereby holds land from him that is, otherwiſe, next heir at law.

VENTRICLE, VENTRICULUS, *q. d. little belly*, in anatomy a diminutive of *venter*; ſignifying a cavity, ſmaller than what we expreſs by a venter; or rather, a diviſion of a venter; or ſome ſmaller cavity, contained in a larger. See VENTER.

There are two cavities in the heart, adjoining to the auricles; and four in the brain; called *ventricles*; which ſee explained under the articles HEART, and BRAIN.

The right ventricle of the heart, in relaxing, admits the blood by the right auricle from the cava; and, contracting, drives it out into the pulmonary arteries; the *left*, receiving the blood by the left auricle, from the lungs, drives it out into the aorta.— *Tab. Anat.* (*Angeiol.*) *fig.* 9. *lit. c.* ſee alſo the articles CAVA, AORTA, and LUNGS; SYSTOLE, DIASTOLE, CIRCULATION, &c.

VENTRICLE, or VENTRICULUS, by way of eminence thus called, is the ſame with the ſtomach. See STOMACH.

For the action of the VENTRICLE *in vomiting*, ſee VOMITING.

VENTRICULI *Ardor*. See the article ARDOR.

VENTRILOQUOUS*, VENTRILOQUUS, *Gaſtriloquous* or *Engaſtrimythus*, a term applied to perſons who ſpeak inwardly, having a peculiar art of forming ſpeech, by drawing the air into the lungs; ſo that the voice proceeding out of the thorax, to a by-ſtander ſeems to come from a diſtance. See ENGASTRIMYTHUS, GASTRILOQUOUS.

* The word is compounded of *venter*, belly, and *loquor*, I ſpeak.

Such a perſon we had lately in London, a ſmith by profeſſion, who had the faculty in ſuch perfection, that he could make his voice appear, now, as if it came out of the cellar; and the next minute, as if in an upper room; and no body preſent perceive that he ſpoke at all: accordingly, he has frequently called a perſon firſt up, then down ſtairs; then out of doors, then this way, then that, without ſtirring from his ſeat, or appearing to ſpeak at all.

Rolandus, in his *Agloſſoſtomographia*, mentions, that if the mediaſtinum, which is naturally a ſingle membrane, be divided into two parts, the ſpeech will ſeem to come out of the breaſt; ſo that the by-ſtanders will fancy the perſon poſſeſſed. See ENGASTRIMANDER.

VENTURINE, or ADVENTURINE, is ſometimes uſed for the fineſt and ſlendereſt gold wire, uſed by embroiderers, &c. See GOLD WIRE.

When reduced into powder, as fine as it can be clipped, or filed, this powder may be ſtrewed on the firſt layer of pure varniſh, made uſe of in japanning, after the varniſh is dry, in order to lay any colour over it. See JAPANNING.

VENUE, or VENEW, in law, a neighbouring, or near place.— *Locus quem vicini habitant*.

Thus, we ſay, twelve of the aſſizes ought to be of the ſame *venue* where the demand is made. See ASSIZE.

—"And alſo return, in every ſuch pannel, upon the venire facias, ſix ſufficient hundreders, at the leaſt, if there be ſo many within the hundred where the venire lies." *Stat.* 25 *Hen.* VIII. See VENIRE *Facias*.

VENUS, in aſtronomy, one of the inferior planets; denoted by the character, ♀. See PLANET.

Venus is eaſily diſtinguiſhed by her brightneſs, and whiteneſs, which exceeds that of all the other planets, and which is ſo conſiderable, that, in a duſky place, ſhe projects a ſenſible ſhadow.— Her place is between the earth and Mercury.

She conſtantly attends the ſun, and never departs from him above 47 degrees: when ſhe goes before the ſun, that is, riſes from him, ſhe is called *phoſphorus*, or *lucifer*, or the *morning ſtar*; and when ſhe follows him, that is, ſets after him, *heſperus*, or *veſper*, or the *evening ſtar*. See PHOSPHORUS, VESPER, &c.

The ſemidiameter of *Venus*, is to that of the earth, as 10 to 19; her diſtance from the ſun is $\frac{723}{1000}$ of the earth's diſtance from the ſun: her excentricity 5; the inclination of her orbit 3° 23′. See INCLINATION, EXCENTRICITY, &c.

Her periodical courſe round the ſun performed in 224 days 17 hours; and her motion round her own axis, in 23 hours. See PERIOD, and REVOLUTION.

Her greateſt diſtance from the earth, according to Caſſini, is 38000 ſemidiameters of the earth; and her ſmalleſt 6000. See DISTANCE.— Her parallax is 3 minutes. See PARALLAX.

Venus, when viewed through a teleſcope, is rarely ſeen to ſhine with a full face, but has phaſes juſt like thoſe of the moon; being now gibbous, now horned, &c. and her illumined part conſtantly turned towards the ſun, *i. e.* it looks towards the eaſt, when *phoſphorus*, and towards the weſt, when *heſperus*. See PHASES.

De la Hire, in 1700, through a teleſcope of 16 feet, diſcovered mountains in *Venus*; which he found to be larger than thoſe in the moon. See MOON.

And Caſſini, and Campani, in the years 1665, and 1666, diſcovered ſpots in her face: from the appearances of which, he aſcertained her motion round her axis. See SPOTS, MACULÆ, &c.

Sometimes ſhe is ſeen in the diſk of the ſun, in form of a dark, round ſpot. See TRANSIT.

In 1672, and 1686, Caſſini, with a teleſcope of 54 feet, thought he ſaw a ſatellite moving round this planet, and diſtant from it about $\frac{3}{5}$ of *Venus*'s diameter.— It had the ſame phaſes as *Venus*, but without any well defined form; and its diameter ſcarce exceeded $\frac{1}{4}$ of that of *Venus*.

Dr. Gregory thinks it more than probable, that this was a ſatellite; and ſuppoſes the reaſon why it is not uſually ſeen, to be the unfitneſs of its ſurface, to reflect the rays of the ſun's light; as is the caſe of the ſpots in the moon: of which, if the whole diſk of the moon were compoſed, he thinks, that planet could not be ſeen as far as to *Venus*. See SATELLITE.

The phænomena of *Venus*, evidently ſhew the falſity of the Ptolemaic ſyſtem: for that ſyſtem ſuppoſes, that *Venus*'s orb, or heaven, encloſes the earth; paſſing between the ſun and Mercury.— And yet all our obſervations agree, that *Venus* is ſometimes on this ſide the ſun, and ſometimes on that; nor did ever any body ſee the earth between *Venus* and the ſun: which yet muſt frequently happen, if *Venus* revolved round the earth in a heaven below the ſun. See SYSTEM, EARTH, &c.

VENUS, in chymiſtry, is uſed for the metal *copper*. See COPPER.

Its character is ♀; which, ſay the adepti, expreſſes it to be gold, only joined with ſome corroſive and arſenical menſtruum; which removed, copper would be gold. See GOLD.

Venus is univerſally allowed, by the chymiſts, &c. to be one of the moſt powerful medicines in nature: of this, is ſaid to have been compoſed the famous Butler's ſtone, which cured moſt diſeaſes by only licking it.— Of this is compoſed that noble remedy of Van Helmont, *viz.* the ſulphur of vitriol, or ens vitrioli, fixed by calcination, and cohobation.— Of the ens vitrioli of *Venus*, is likewiſe compoſed Mr. Boyle's arcanum, the colcothar vitrioli. See VITRIOL.

It is certain, copper is a moſt excellent emetic, and a noble antidote againſt poiſons; for it is no ſooner taken than it exerts its force: whereas other vomitories lie a good while in the ſtomach: but one ſingle grain of ruſt of *Venus* immediately vomits.— Hence ſyrups, that have ſtood over night in copper veſſels, create a vomiting. See EMETIC, VOMITING, &c.

It is alſo an excellent medicine in chronical caſes: hence a famous phyſician is recorded to have cured Charles V. of a dropſy by the uſe of copper.

Venus is diſſoluble by all the ſalts known, both acid, alkaline, and nitrous; nay, even by water and air, conſidered as they contain ſalt. See DISSOLUTION, SALT, &c.

It is from this common reception of all menſtruums, that copper is called *Venus*, q. d. *meretrix publica*, a common proſtitute: though others take the denomination to have been occaſioned by its running of a ſea-green colour, when diſſolved by acids.

Cryſtals of VENUS. See the article CRYSTAL.

Mount of VENUS, *Mons* VENERIS, among anatomiſts, is a little hairy protuberance, in the middle of the pubes of women; occaſioned by the more than ordinary collection of fat under the ſkin in that place. See PUBES.

Among chiromancers, the *mount of Venus* is a little eminence in the palm of the hand, at the root of one of the fingers.

VERA *Billa*. See the article BILLA.

VERB, in grammar, a word ſerving to expreſs what we affirm of any ſubject, or attribute to it— as the words, *is*, *underſtands*, *hears*, *believes*, &c. See WORD.

The *verb* is thus called of the Latin *verbum*, word, by way of eminence; as being the principal word of a ſentence. See SENTENCE.

The common definition given by grammarians, is, that a *verb* is a word which betokens *being*, *doing*, or *ſuffering*.

To conceive the origin and office of *verbs*, it may be obſerved, that the judgment we make of any thing, as when I ſay *the earth is round*, neceſſarily includes three terms. See TERM.— The firſt, called the *ſubject*, is the thing we affirm of, *e. gr.* earth. See SUBJECT.— The ſecond, called the *attribute*, is the thing affirmed, *e. gr.* round. See ATTRIBUTE.— The third, *is*, connects thoſe two terms together, and expreſſes the action of the mind, *affirming* the attribute of the ſubject.

This laſt is what we properly call the *verb*; and which ſome of our later grammarians, particularly the port royaliſts, chuſe to call by a more ſignificant word, *affirmation*.— The reaſon is, that its principal uſe is to ſignify *affirmation*; that is, to ſhew the diſcourſe, wherein that word is uſed, is the diſcourſe of a man who does not only conceive things, but judges and affirms ſomewhat of them.

By this circumſtance, a *verb* is diſtinguiſhed from nouns which alſo ſignify an affirmation, as *affirmans affirmatio*; thoſe only ſignify an affirmation, as that, by a reflection of of the mind, is rendered an object of thought: ſo that they do not ſhew, that the perſon who uſes them *affirms*, but only that he conceives *an affirmation*. See AFFIRMATION.

Though the principal uſe of *verbs* be to ſignify affirmation; they alſo ſerve to expreſs the other motions of the ſoul: as to deſire, pray, command, &c. but this they only do, by changing the mood, or inflection. See MOOD.

Here, we only conſider the *verb* in its primary ſignification, which is that it has in the indicative mood.— On this footing, the *verb* ſhould have no other uſe, but to mark the connection which we make in the mind, between the two terms of a propoſition; but the *verb eſſe*, to be, is the only one that has retained this ſimplicity: nor, in ſtrictneſs, has this retained it, but in the third perſon, as *eſt*, is.

In effect, men being naturally inclined to ſhorten their expreſſions, to the affirmation they have almoſt always added other ſignifications, in the ſame word: thus. *e. gr.* they add that of ſome attribute, ſo as that two words make a propoſition; as in *Petrus vivit*, Peter lives: where *vivit* includes both the attribute and affirmation; it being the ſame thing to ſay *Peter lives*, as that *Peter is living*.— And hence the great variety of *verbs* in every language.

For, had people been contented to give the *verb* its general ſignification, without any additional attribute, each language would only have needed one *verb*, *viz.* the *verb* ſubſtantive *eſt*, is.

Again, on ſome occaſions, they alſo ſuperadd the ſubject of the propoſition, as *ſum homo*, I am a man: or *vivo*, I live: and hence the diverſity of perſons in *verbs*. See PERSON.

Again, we alſo add to the *verb*, a relation to the time, with regard to which we affirm; ſo that one ſingle word, as *cœnaſti*, ſignifies that I attribute to the perſon I ſpeak the action of ſupping, not for the preſent time, but for the paſt: and hence the great diverſity of tenſes in moſt *verbs*. See TENSE.

The diverſity of theſe ſignifications, or additions in the ſame word, has perplexed and deceived many of our beſt authors, in the nature of a *verb*; and led them to conſider it, not according to what is eſſential to it, which is to affirm; but according to ſome of its accidental relations.

Thus, Ariſtotle, taking up with the third of thoſe additional ſignifications, defines *verb* to be *vox ſignificans cum tempore*; a word ſignifying ſomething with time.

Others, as Buxtorf, adding the ſecond relation, define it, *vox flexilis cum tempore & perſona*; a word admitting of divers inflections, in reſpect of time and perſon.

Others, taking up with the firſt of the additional ſignifications, which is that of the attribute, and conſidering that the attributes men ordinarily add to the affirmation, were actions and paſſions; have ſuppoſed the eſſence of a *verb* to conſiſt in ſignifying *actions*, or *paſſions*.

Laſtly, Scaliger imagined he had made a great diſcovery in his book of the *Principles of the Latin tongue*, in ſaying, that the diſtinction of things into *permanentes*, and *fluentes*, into what remain, and what paſs away, is the proper ſource of the diſtinction between *nouns*, and *verbs*; the firſt being to ſignify what remains, and the ſecond what paſſes.

But from what we have ſaid, it is eaſy to perceive, that theſe definitions are all falſe; and that the only true definition is, *vox ſignificans affirmationem*: This definition includes all that is eſſential to the *verb*; but if one would likewiſe include its principal accidents, one might define it, *vox ſignificans affirmationem, cum deſignatione perſonæ, numeri, & temporis*; a word which ſignifies an affirmation, with a deſignation of perſon, number, and tenſe: which is what properly agrees to the *verb* ſubſtantive *eſt*.

For as to other *verbs*, conſidering as becoming different by the union of certain attributes, one may define them thus; *vox ſignificans affirmationem alicujus attributi, cum deſignatione perſonæ, numeri, & temporis*; a word which expreſſes the affirmation of ſome attribute, with a deſignation of perſon, number and time.

Verbs are variouſly divided; with reſpect to the ſubject, they are divided into *active*, *paſſive*, *neuter*, &c. with reſpect to their inflections, into *regular*, and *irregular*; *perſonal*, and *imperſonal*; *auxiliary*, *ſubſtantive*, &c.

VERB *Active*, is a *verb* which expreſſes an action that falls on another ſubject, or object. See ACTIVE.

Such are, *I love*, *I work*, &c. which ſignify the action of *loving*, *working*, &c.— Of theſe grammarians make three kinds; the one called *tranſitive*, where the action paſſes on a ſubject different from the agent;— *reflected*, where the action returns upon the agent;— *reciprocal*, where the action returns mutually upon the two agents that produc'd it.

VERB *Paſſive*, is that which expreſſes a paſſion; or which receives the action of ſome agent; and which is conjugated in the modern tongues, with the auxiliary *verb*, *I am*, *je ſuis*, *je ſono*, &c. See AUXILIARY.

Some do not allow of any *verb paſſive* in the modern languages: the reaſon is, what we call *paſſive*, is nothing but the particle of the *verb*, joined with the auxiliary *verb*, *to be*; whereas the *verbs paſſive* of the Latin, *&c.* have their particular terminations.

VERB *Neuter*, is that which ſignifies an action that has no particular object whereon to fall; but which, of itſelf, takes up the whole idea of the action— as, *I ſleep*, *thou yawneſt*, *he ſnores*, *we walk*, *you run*, *they ſtand*. See NEUTER.

The Latins call them *neuters*, by reaſon they are neither active nor paſſive; though they have the force and ſignification of both: as, *I languiſh*, ſignifies as much as *I am languiſhing*; *I obey*, as much as *I exerciſe obedience*, &c. only that they have no regimen to particularize this ſignification.

Of theſe *verbs*, there are ſome which form their tenſes by the auxiliary *verb*, *to have*; as, *I have ſlept*, *you have run*.— Theſe, grammarians call *neuters active*.

Others there are, which form their compound parts by the auxiliary, *to be*; as, *to come*, *to arrive*, &c. for we ſay, *I am come*, not *I have come*, &c.— Theſe are called *neuters paſſive*.

VERB *Subſtantive*, is that which expreſſes the being, or ſubſtance which the mind forms to itſelf, or ſuppoſes in the object; whether it be there, or not— as, *I am*, *thou art*. See SUBSTANTIVE.

Auxiliary, or *Helping* VERBS, are thoſe which ſerve in conjugating active and paſſive *verbs*: ſuch are, *I am*, *I have*, &c. See AUXILIARY.

The abbot de Dangeau diſtinguiſhes all *verbs* into two general kinds; *auxiliary verbs*, and *verbs* which make uſe of auxiliaries. This diſtinction ſome may tax as not very juſt; in regard, *auxiliary verbs*, ſometimes make uſe of auxiliaries themſelves; but this does not deſtroy the diviſion; it only ſhews, that the *auxiliary verb* has two formalities, or two different qualities to be conſidered under; in virtue whereof, it conſtitutes, as it were, two ſorts of *verbs*.

The *verbs* which make uſe of auxiliaries, he divides into *active*, *neuter*, and *pronominal*.— *Verbs neuter*, he farther diſtinguiſhes into *neuters active*, and *neuters paſſive*. *Pronominals* he diſtinguiſhes into *identic*, *reciprocal*, *neutrized*, and *paſſived*— But ſeveral of theſe are peculiar to the French language.

Verbs, in the Engliſh, and moſt modern tongues, do not change their endings, as in Latin, to denote the ſeveral times, modes, *&c.* of their being, doing, or ſuffering; but in lieu thereof, make uſe of auxiliaries: as *have*, *am*, *be*, *do*, *will*, *ſhall*, *may*, *can*, &c.

Regular VERBS, are thoſe which are conjugated after ſome one manner, rule, or analogy. See CONJUGATION.

Irregular, or *Anomalous* VERBS, are thoſe which have ſomething ſingular in the terminations, or formations of their tenſes. See ANOMALOUS.

The irregularities in our Engliſh *verbs*, lie wholly in the formation of the preter tenſe, and paſſive participle.— The firſt, and moſt general irregularity, took its riſe from the quickneſs of our pronunciation, by changing the conſonant *d* into *t*; the vowel *e*, in the regular ending *ed*, being cut off, that the pronunciation might be more ready: thus, for *dwelled*, *keeped*, *ſended*, we ſay, *dwelt*, *kept*, *ſent*.

VERBS *imperſonal*, are thoſe which have only the third perſon— as, *it behoves*, &c. See IMPERSONAL.

There are alſo *redublicative verbs*; as, *reſound*, *recall*, &c. *frequentative verbs*, &c.

VERBAL*, ſomething that belongs to *verbs*, or even to words ſpoke with the mouth. See ORAL.

* The word is formed from the Latin, *verbero*, I ſmite.

Verbal nouns, are thoſe formed from verbs. See NOUN.— A *verbal contract*, is that made merely by word of mouth; in oppoſition to that made in writing. See CONTRACT, *&c.*

VERBAL *Accident*. See the article ACCIDENT.

VERBERATION, *ſmiting*, in phyſics, a term uſed to expreſs the cauſe of ſound, which ariſes from a *verberation* of the air, when ſtruck, in divers manners, by the ſeveral parts of the ſonorous body firſt put into a vibratory motion. See SOUND.

VERDEGREASE*, or VERDEGRIS, a kind of ruſt of copper, of great uſe among painters for a green colour. See GREEN, and COLOUR.

* The word is formed from the Latin, *viride æris*: It it alſo called *ærugo*. Others calls it the *flower*, and others the *vitriolic ſalt of copper*; though, in reality, it be the proper ſubſtance of the metal. See VITRIOL.

Verdegreaſe is prepared from copper-plates, and rape or huſks of grapes well ſaturated with wine, put up in earthern pots; and ranged ſtratum ſuper ſtratum; that is, firſt rape, then copper; and ſo alternately.

When the pots are filled, they are ſet in a cellar; whence, after ſome time, they are taken out, to gather the *verdegreaſe*, which is a green ruſt covering the plants all over. See RUST, and COPPER.

Some talk of *verdegreaſe* made with vinegar, and other corroſive ſalts; but it is a miſtake; the beſt wine being nothing too good for the purpoſe.

Accordingly, the greateſt part of the *verdegreaſe* conſumed in Europe, is made in Languedoc, of the wines of that country; and is exported in cakes of about 25 pounds weight each. There is but little quite pure: to be good, it muſt be very dry, of a deep green, and pretty clear of white ſpots.

The apothecaries uſe to diſſolve *verdegreaſe* in diſtilled vinegar, and then filtrate and evaporate it in the cellar; upon which it ſhoots into cryſtals.— Theſe cryſtals are uſed among chirurgeons, *&c.* to cleanſe old ulcers, eat off fungous fleſh, *&c.*

VERDERER*, or VERDEROR, a judical officer of the king's foreſt, whoſe buſineſs is to look to the vert, and ſee it well maintained. See VERT.

* The word is formed from the Latin *viridarius*, which Ulpian uſes in the like ſignification.

He is ſworn to keep the aſſizes of the foreſt; as alſo to view, receive, and to enroll the attachments and preſentments of all manner of treſpaſſes, relating to vert and veniſon therein. See FOREST.

VERDETER. See the article VERDITER.

VERDICT*, is the anſwer of the jury given to the court, concerning the matter of fact, in any cauſe, civil or criminal, committed by the court to their trial and examination. See JURY, and TTIAL.

* It is called *verdict*, for *vere dictum*, q. d. *dictum veritatis*, the dictate of truth.

A *verdict* is either *general*, or *ſpecial*.

General VERDICT, is that which is brought into the court in like general terms as the general iſſue: as in action of diſſeiſin, the defendant pleads, no wrong, no diſſeiſin.— Then the iſſue is general, whether the fact be wrong, or not: which being committed to the jury, they, upon conſideration of the evidence, come in and ſay, either for the plaintiff, *That it is a wrong diſſeiſin*; or for the defendant, *That it is no wrong, no diſſeiſin*. See ISSUE.

Special VERDICT, is, when they ſay at large, that ſuch and ſuch a thing they found to be done by the defendant, or tenant; declaring the courſe of the fact, as in their opinion it is proved; and as to the law, upon the fact, proving the judgment of the court.

This *ſpecial verdict*, if it contain any ample declaration of the cauſe from the beginning to the end, is called a *verdict at large*.

Attainder by VERDICT. See the article ATTAINDER.

VERDITER, VERDETER, a kind of mineral ſubſtance ſometimes uſed by the painters, *&c.* for a blue, but more uſually mixed with yellow for a green colour. See GREEN, &c.

Verditer, according to Savary, ought to be made of the lapis armenus; or, at leaſt, of an earthy ſubſtance much like it, brought from the mountains of Hungary, *&c.* only prepared by powdering it, and cleanſing it by lotion. See ARMENIAN *Stone*.

But this ſtone and earth are very rare; and the *verditer* uſed is not a native, but a factitious ſubſtance: the proper way of preparing it, we are told, is by caſting wine or water upon new copper, juſt as it comes red hot out of the furnace, and catching the ſteams which riſe from it upon copper-plates.— Others ſay, it is prepared by diſſolving copper plates in wine, much after the manner of verdegreaſe.

The method in practice, among us, is ſaid to be as follows:— Into an hundred pounds weight of whiting, the refiners pour their copper water, and ſtir them together every day for ſome hours, till the water grows pale: then they pour that away, and ſet it by for farther uſe; and pour no more of the green water, and ſo till the *verditer* be made: which being taken out, is laid on large pieces of chalk in the ſun, till it be dry for the market. *Harris.*

The water mentioned to be poured off from the *verditer*, (which remains at the bottom of the tub) is put into a copper, and boiled till it come to the thickneſs of water-gruel: now, conſiſting principally of ſalt-petre reduced, moſt of the ſpirit of vitriol being gone with the copper into the *verditer*; and a diſh full of its being put into the other materials for aqua fortis, is re-diſtilled, and makes what they call a *double water*, which is near twice as good as that made without it.

VERDOY, in heraldry, is applied to a bordure of a coat of arms; charged with any kinds or parts of flowers, fruits, ſeeds, plants, *&c.*

VERDURE*, the quality of greenneſs. See GREEN.

* The word is French, formed of *verd*, green.

VERGE, VIRGA, a rod, ſwitch, or yard; particularly a ſtick or wand, which perſons are admitted tenants by holding in their hands, ſwearing fealty to the lord of the manor. See VIRGA, and INVESTITURE.

On this account, they are all called *tenants by the verge*. See TENANT.

Dented VERGE, among floriſts, is a jagged edge, or circumference of a leaf. See LEAF, and DENTED.

VERGE is alſo uſed for the compaſs or extent of the king's court; within which is bounded the juriſdiction of the lord ſteward of the king's houſhold. See COURT, STEWARD, HOUSHOLD, *&c.*

It is thus called, from the *verge* or ſtaff which the marſhal bears.—It was antiently alſo denominated *pax regis*, or the king's peace. See PEACE.

The lord ſteward, by virtue of his office, without any commiſſion, judges of all tranſgreſſions, as treaſons, murders, felonies, bloodſhed, *&c.* committed in the court, or within the *verge* thereof; which extends, every way, the ſpace of twelves miles from the chief tunnel of the court; only London, by charter, exempted.

Court of VERGE, is a court, or tribunal, in manner of a king's-bench; which takes cognizance of all crimes, and miſdemeanors committed within the *verge*, or juriſdiction of the king's court.

It is held in the compting-houſe, by the lord ſteward, as judge thereof, aſſiſted by other officers of the houſhold; as, the treaſurer, comptroller, cofferer, clerks of the green-cloth, *&c.* See GREEN-*Cloth*, &c.

VERGE *of Land*, *Virga Terræ*. See the article YARD-*Land*.

VERGERS, VIRGATORES *ſervientes*, are officers who carry white wands before the juſtices of either bench; called alſo, *porters of the verge*. See PORTER.

VERGERS *of cathedral or collegiate churches*, are inferior officers, who go before the biſhop, dean, *&c.* with a verge, or rod tipped with ſilver.

VERGILIÆ, a conſtellation, whoſe appearance denotes the approach of the ſpring. See SPRING.

According to the poets, they were the daughters of Atlas; and by the Greeks were called *pleiades*: but the Romans named them *vergilæ*. See PLEIADES.

VERIFICATION, the act of proving, or making a thing appear true. See CONFIRMATION, *&c.*

In the French law, *verifying* is uſed for the recording of the king's edicts, and decrees by the parliament.

VERIFICATIONE *Relicta*. See the article RELICTA.

VERISIMILI. See the article RULE *de veriſimili notitia*.

VERISIMILITUDE. See the article PROBABILITY.

VERJUICE, a juice or liquor drawn from ſour grapes, or apples, unfit for wine, or cider; or from ſweet ones, while yet acid, and unripe. See CIDER.

Its chief uſe is in ſauces, ragouts, *&c.* though it is alſo an ingredient in ſome medicinal compoſitions; and is uſed by the wax-chandlers to purify their wax.

It has its name from a large ſort of grape, called *verjus*, or *bourdelas*; which is ſaid never to grow perfectly ripe; or rather, which in its utmoſt maturity is too auſtere and ſour to be uſed in wine: whence it is commonly turned into *verjuice*; tho' in France all unripe grapes are denominated *verjus*. There is alſo a tolerable *verjuice* made of crabs, gathered, laid in a heap to ſweat, the ſtalks, *&c.* ſeparated; then ſtamped, or ground, and the crab-maſh put in a hair bag; the juice ſqueezed in a preſs, barelled up cloſe, and ſet in a warm place to work for ten or twelve days.

VERMES, in medicine. See the article WORMS.

VERMICELLI*, or VERMICHELLY, a kind of meſs, prepared of flower, cheeſe, yolks of eggs, ſugar, and ſaffron; and reduced into little long pieces, or threads, like worms, by forcing it with a piſton through a number of little holes in the end of a pipe made for the purpoſe.

* The word, in the original Italian, ſignifies *little worms*: they alſo call it *tagliarini*, and *milleſanti*.

It was firſt brought from Italy, where it is in great vogue. In effect, it is the great regale of the Italians.—Other nations are not eaſily brought into the taſte of it.—It is chiefly uſed in ſoups and pottages, to warm, provoke venery, *&c.*

VERMICULAR, an epithet given to any thing that bears a relation, or reſemblance to worms, *vermiculi*. See WORM. Anatomiſts particularly apply it to the motion of the inteſtines, and certain muſcles of the body. See INTESTINE, *&c.*

The *vermicular*, or periſtaltic motion of the inteſtines, is performed by the contraction of the fibres thereof, from above downward; as the antiperiſtalic motion is by their contraction from below upwards. See PERISTALTIC.

The contraction happening in the periſtaltic, which others call the *vermicular motion*, as reſembling the motion of worms, does not affect all the parts of the inteſtines at once; but one part after another.

VERMICULAR, or VERMICULATED *Work*, *Opus vermiculatum*, in ſculpture, a ſort of ornament, conſiſting of frets, or knots, in Moſaic pavements, winding, and preſenting, in ſome ſort, the tracks made by worms*. See MOSAIC.

* *Quam lepide lexeis compoſitæ, ut teſſerulæ omnes*
Arte pavimento, atque emblemate vermiculato.
Cic. de Orat. lib. III.

VERMICULARES (in anatomy) Muſculi, Tabuli.

VERMIFORMIS, in anatomy, a term applied to various parts in the human body; bearing ſome reſemblance to worms.—Such are the

Proceſſus, or *Apophyſes* VERMIFORMES, two extremities of the cerebellum, ſituate near the fourth ventricle of the brain. See CEREBELLUM, and EPIPHYSES.

VERMIFORMES *Muſculi*, are the four muſcles in each hand and foot, which bring the fingers and toes towards the thumbs and great toes; called alſo *lumbricales*. See LUMBRICALES.

VERMIFUGUS, the ſame with *anthelmintic*. See ANTHELMINTIC, and WORM-*Powder*.

VERMILION, a bright, beautiful red colour; in great eſteem among the antients, under the denomination of *minium*. See RED, COLOUR, MINIUM, *&c.*

There are two kinds of *vermilion*; the one *natural*, the other *factitious*.

The *natural* is found in ſome ſilver mines, in form of a ruddy ſand; which they prepare, and purify by ſeveral lotions, and coctions.

VERMILION is made of artificial cinnabar, ground up with white wine, and afterwards with the whites of eggs: in this ſtate it is made into cakes, and left to dry. To fit it for uſe, they grind it up a ſecond time with water and whites of eggs,—To purify and heighten its colour, ſome grind it up with urine, or ſpirits of wine, to which a little ſaffron is added.—See CINNABAR.

Some alſo pretend to make *vermilion* of lead, burnt and waſhed; or of ceruſſe, rubified by fire.—But theſe are not properly denominated *vermilion*, but *red lead*. See LEAD.

It is this laſt, however, that ſeems to be the artificial minium of the antients; and accordingly, apothecaries, and painters ſtill give it the name, to enhance the price. See MINIUM.

The antient Greek and Latin authors, have given divers fabulous accounts of their minium; and ſeveral of the moderns have adopted their dreams: Theophraſtus attributes the firſt invention of making it to Callias the Athenian; who hit upon it, in endeavouring to draw gold, by fire, out of a red ſand, found in the ſilver mines, in the year of Rome 249.—But Vitruvius ſays, it was diſcovered in the Cilbian fields; where it was drawn from a red ſtone, called by the Greeks *anthrax*.

We have two kinds of *vermilion* from Holland; the one of a deep red, the other pale: but it is the ſame matter at bottom; the difference of colour only proceeding from the cinnabar's being more or leſs ground: when fine ground, the *vermilion* is pale; and this is preferred to the coarſer, and redder.

It is of conſiderable uſe among the painters in oil, and miniature; and likewiſe among the ladies, as a fucus, or paint, to heighten the complexion of ſuch as are too pale. See PAINTING, MINIATURE, *&c.*

VERMILION is ſometimes alſo, though improperly, uſed for what we otherwiſe call *kermes*, or *ſcarlet grain*. See KERMES, *&c.*

VERMINATION, VERMINATIO, the act of breeding worms, and other vermine; particularly bots in cattle, *&c.*

VERMINATION is ſometimes alſo uſed, among phyſicians, for a ſort of tormina ventris, or wringing of the guts; wherein the patient is affected, as if worms were gnawing his inteſtines. See GRIPES, and TORMINA.

VERMINE, VERMINA, a collective name, including all kinds of little animals, or inſects, which are hurtful or troubleſome to men, beaſts, fruits, *&c.* as worms, lice, fleas, bugs, caterpillars, ants, flies, *&c.* See INSECT, WORM, BLIGHT, *&c.*

VERMIVOROUS *Animals*, are ſuch as feed upon worms. See ANIMAL.

VERNACULAR, is applied to any thing that is peculiar to ſome one country. See LOCAL, *&c.*

Whence, diſeaſes which reign moſt in any particular nation, province, or diſtrict, are ſometimes called *vernacular diſeaſes*: more frequently *endemic diſeaſes*. See ENDEMIC and DISEASE. Such are the *plica polonica*, *ſcorbutus*, *tarantiſm*, &c. See PLICA, SCORBUTUS, TARANTISM, *&c.*

VERNAL, ſomething belonging to the ſpring ſeaſon. See SPRING.—Hence, *vernal leaves*, are thoſe leaves of plants which come up in the ſpring, *&c.* See LEAF.

VERNAL *Signs*, are thoſe which the ſun is in, during the ſpring ſeaſon, *viz.* Aries, Taurus, and Gemini. See SIGN.

VERNAL *Equinox*, is that which happens when the ſun is aſcending from the equator towards the north pole. See EQUINOX.

VERNISH. See the article VARNISH.

VERONICA, a term abbreviated from *verionica* of *vera icon*, q. d. *true image*; and applied to portraits, or repreſentations of the face of our Saviour on handkerchiefs.

Veronica's are imitations of that celebrated original one, preſerved with great veneration at St. Peter's in Rome; and imagined, by ſome, to be the handkerchief laid over our Saviour's face in the ſepulchre.

The firſt mention we find of this famous relick, is in a ceremonial, compiled in 1243, dedicated to pope Celeſtin, by Benedict a canon of S. Peter's: but there is no mention made of the time when it was brought to Rome.— A feaſt is kept in honour thereof in moſt churches, on the Tueſday in quinquageſima week.

It is to be obſerved, that the name *veronica*, is only given to ſuch handkerchiefs as repreſent no more of our Saviour than his face: for ſuch as repreſent his whole body, as that of Benſançon, which ſhews his fore part at length; and that of Turin, which repreſents both his fore and hind part, as having covered him all over, were never called by this name.

The painters ſometimes repreſent the *veronica* as held up by an angel, but moſt commonly by a woman; which woman, the common people imagine to be a ſaint, called Saint *Veronica*.

On this principle, ſome people, towards the cloſe of the ninth century, began to fancy there might have been a woman of that name in Jeruſalem, who had preſented her handkerchief to our Saviour, as he went to Calvary, to wipe his face withal, beſmeared, as it was, with ſweat and blood; and that the picture of his face had been miraculouſly impreſſed thereon.

This was no ſooner imagined by ſome, than it was believed by others: and accordingly, we find by the travels of Bernard de Bredemback, dean of Mentz, to the Holy Land, in 1483, printed in 1502, that it was not long ere her very houſe was found out.— From that time the fiction gained ground, and became a current legend.

It was at length added, that this ſame woman, S. *Veronica*, was the woman troubled with the flux of blood in the goſpel: and accordingly, ſhe was ſoon joined with S. Fiacrius, and invoked together with him againſt the hæmorrhoids.— And hence the eſtabliſhment of feaſts, in honour of S. *Veronica*, in the churches dedicated to S. Fiacrius.

In ſome of theſe churches, particularly at S. Giles's in Valenciennes, this ſaint is commonly called S. *Venice*, by abbreviation from the genitive, *Veronicæ:* and the women have a cuſtom at certain times of the year, to hang linen ſwathes, wherewith they had girt themſelves for nine days, near her ſtatue.— And it is thence, or rather, for our Saviour's picture expreſſed on the linen handkerchief, that the milliners have taken S. *Veronica*, or, as they call her, S. *Veniſſe*, or S. *Venecia*, or *Veniſa*, for their tutelary ſaint.

VERRUCA, in medicine. See the article WART.

Hence, *verrucous* is applied to any excreſcencies which have a reſemblance to warts.— There are alſo *verrucous* ulcers, &c.

VERRY, in heraldry. See the article VAIRY.

VERSA. See the article VICE *Verſa*.

VERSE, VERSUS, in poetry, a line or part of a diſcourſe, conſiſting of a certain number of long and ſhort ſyllables, which run with an agreeable cadence; the like being alſo reiterated in the courſe of the piece. See POETRY.

This repetition, according to F. Boſſu, is neceſſary to diſtinguiſh the notion of *verſe* from that of proſe: for in proſe, as well as *verſe*, each period and member are parts of diſcourſe, conſiſting of a certain number of long and ſhort ſyllables; only proſe is continually diverſifying its meaſures, and cadences; and *verſe* repeats them. See PROSE.

This repetition of the poets, appears even in the manner of writing; for one *verſe* being finiſhed, they return to the beginning of another line to write the *verſe* following: and it is to this return, that *verſe* owes its name; *verſus* coming from *vertere*, to *turn*, or *return*.

Accordingly, we find the ſame word uſed, to ſignify any thing that is placed in a certain, regular order: Cicero uſes *verſus* for a line in proſe; Virgil for a row of trees, and even of oars in a galley. But as the regularity of *verſe* carries with it more charms, and requires a greater degree of exactneſs, the word has, in time, become appropriated to poetry.

To make *verſe*, it is not enough that the meaſures and quantities of ſyllables be obſerved, and ſix juſt feet put, one after another, in the ſame line: there are further required certain agreeable cadences, particular tenſes, moods, regimens, and even ſome words unknown in proſe.

But what is chiefly required, is an elevated, bold, figurative manner of diction: this manner, is a thing ſo peculiar to this kind of writing, that without it, the moſt exact arrangement of longs and ſhorts, does not conſtitute *verſe*, ſo much as a ſort of meaſured proſe. See VERSIFICATION.

The Greek and Latin *verſes*, conſiſt of a certain number of feet, diſpoſed in a certain order. See FOOT.— Some have attempted to make French and Engliſh *verſes* on the ſame foundation; but without ſucceſs. See QUANTITY, and HEXAMETER.

Voſſius is very ſevere on the modern *verſe*, and makes it altogether unfit for muſic: Our *verſes*, ſays he, run all as it were on one foot; without diſtinction of members, or parts, and without regard to the natural quantities of ſyllables.— We have no rhythmus at all; and we mind nothing, but to have a certain number of ſyllables in a *verſe*, of whatever nature, and in whatever order. See RHYTHMUS.

Mr. Malcolm vindicates our *verſe* from this imputation. It is true we do not follow the metrical compoſition of the antients; yet we have ſuch a mixture of ſtrong and ſoft, long and ſhort ſyllables, as makes our *verſes* flow, ſmooth or rumbling, ſlow or rapid, agreeable to the ſubject.— Inſtances of all which we have in the following lines:

“ Soft is the ſtrain when Zephyr gently blows:
“ The hoarſe rough *verſe* ſhould like the torrent roar.
“ The line too labours, and the words move ſlow.
“ Flies o'er the unbended ears, and ſkims along the main.

By making a ſmall change, or tranſpoſition of a word or ſyllable, in any of theſe *verſes*, any body who has an ear will find, that we make a great matter, of the nature and order of the ſyllables. See NUMBERS.

Voſſius adds, that the antient odes were ſung, as to the rhythmus, in the ſame manner as we ſcan them: every pes being a diſtinct bar, or meaſure, ſeparated by a diſtinct pauſe: though, in reading, that diſtinction was not accurately obſerved.

Laſtly, he obſerves, that their odes had a regular return of the ſame kind of *verſe*; and the ſame quantity of ſyllables, in the ſame place of every *verſe:* whereas, in the modern odes, to follow the natural quantity of our ſyllables, every ſtanza would be a diſtinct ſong. See ODE.

It is next to impoſſible to write proſe without, ſometimes, intermixing *verſe* with it; ſo that Vaugelas's rule, which enjoins us to avoid them, is next to impracticable.— This may be further ſaid, that for ſhort *verſes*, they are ſo little perceived, that it is ſcarce worth while to ſtrain one's ſelf to avoid them; and as to long *verſes*, they are chiefly to be avoided in the ends of periods; for, in the middle, they are ſcare felt.

In the general, rules of this kind muſt be conſidered, as principally regarding numerous *verſes*, and ſuch as are readily diſtinguiſhed by their cadence: thus, in Latin, it is ſcarce poſſible to avoid iambic *verſes*; but hexameters muſt, by all means, be avoided, their cadence being more ſenſible and more ſtudied. See RHYME, &c.

VERSES are of various kinds; ſome denominated from the number of feet whereof they are compoſed; as, the *monometer*, *dimeter*, *trimeter*, *tetrameter*, *pentameter*, *hexameter*, [*] *hendecaſyllabum*, &c.— Some from the kinds of feet uſed in them; as the pyrrhichian, proceleuſmatic, iambic, trochaic, dactylic, anapæſtic, ſpondaic or moloſſean, chor-iambic, iambi-dactylic, or dactylotrochaic.— Sometimes from the names of the inventers, or the authors who have uſed them with moſt ſucceſs: as, the anacreontic, archilochian, hipponactic, pherecratian, glyconian, alcmanian, aſclepiadean, alcaic, ſteſichorian, phaliſcan, ariſtophanian, callimachian, galliambic, phalæcian, and ſapphic.— Sometimes from the ſubject, or the circumſtances of the compoſition; as, the heroic, elegiac, adonic, &c. See HEXAMETER, PENTAMETER, IAMBIC, &c.

The moderns have invented *heroic*, or *alexandrine verſes*, which conſiſt of twelve or thirteen ſyllables. See ALEXANDRINE.

The antients, likewiſe, invented various kinds of poetical deviſes in verſe; as *cento's*, *echo's*, and *monorhymes*. See CENTO, ECHO, &c.

Equivocal VERSES, thoſe where the ſame words, contained in two lines, carry a different ſenſe. See EQUIVOCAL, &c.

Reciprocal VERSES, thoſe which read the ſame backwards as forwards. See RETROGRADE.

Concordant VERSES.	See	CONCORDANT.
Dactylic VERSES.		DACTYLIC.

Rhopalic VERSES.		RHOPALIC.
Serpentine VERSES.		SERPENTINE.
Technical VERSES.		TECHNICAL.

VERSE, is alſo uſed for a part of a chapter, ſection, or paragraph ſubdivided into ſeveral little articles. See CHAPTER.

The whole Bible is divided into chapters; and the chapters ſubdivided into *verſes*. See BIBLE.

The diviſion of *verſes* in the New Teſtament, was firſt made by Robert Stephens: and ſo negligently was it done, that his ſon, Henry Stephens, aſſures us, he worked at it as he travelled from Paris to Lions.— Many learned men find great fault with that diviſion; and yet it is every where followed.

M. Simon obſerves, that the Greeks and Latins meant by *verſe*, a line, containing a certain number of words.— He adds, that the authors of thoſe days, to prevent any thing being added or taken away from their works, uſed to mark at the end, the number of *verſes* they contained; but the books themſelves were wrote all running, without any diviſions, points, or the like.

VERSED *ſine of an Arch*, a ſegment of the diameter of a circle, lying between the foot of a right ſine, and the lower extremity of the arch. See ARCH, and COVERSED.

---

[*] In reckoning the feet of iambics, trochaics, and anapæſtics, each meter is a dipody, or comprehends two feet.— In other verſes a meter is but a ſingle foot.—Hence it is, that the iambic trimeter is alſo called *ſenarium*, becauſe compoſed of ſix feet. *Serv. Centim. p.* 1817.

Thus, DE, (*Tab. Trigonometry, fig.* 1.) is the *verſed ſine* of the arch AE. See SINE.

VERSIFICATION, the art, or manner of making verſe; alſo the tune and cadence of verſe. See VERSE.

Verſification, is properly applied to what the poet does more by labour, art, and rule, than by invention, and the genius or furor poeticus.

The matter of *verſification*, is long and ſhort ſyllables, and feet compoſed of them; and its form, the arangement of them, in correct, numerous, and harmonious *verſes*; but this is no more than a mere tranſlator may pretend to, and which the Catilinarian war, put in verſe, might merit. See MEASURE, QUANTITY, CADENCE, RHYTHM, *&c.*

It is with reaſon, therefore, that theſe ſimple matters are diſtinguiſhed from the grand poetry, and called by the name *verſification*. See POETRY.

In effect, there is much the ſame difference between grammar and rhetoric, as between the art of making verſes, and that of inventing poems.

VERSION, a tranſlation of ſome book, or writing, out of one language into another. See TRANSLATION.

VERSO. See the article FOLIO *Verſo*.

VERT, in heraldry, the term for a green colour. See GREEN, and COLOUR.

It is called *vert* in the blazon of the coats of all under the degree of nobles; but in coats of nobles it is called *emerald*; and in thoſe of kings, *Venus*.

In engraving, it is expreſſed by diagonals, or lines drawn athwart, from right to left, from the dexter chief corner, to the ſiniſter baſe. See *Tab. Herald. fig.* 48.

In lieu of *vert*, the French heralds uſe *ſinople*, or ſynople. See SINOPLE.

VERT, or *Green Hue*, in foreſt law, any thing that grows, and bears a green leaf within the foreſt, that may cover a deer. See FOREST, GAME, *&c.*

This is divided into *over-vert*, and *neither-vert*.

Over-VERT is the great woods; which, in law-books, are uſually called *hault-bois*.

Nether-VERT is the under-woods; otherwiſe called *ſub-bois*.

We ſometimes alſo meet with *Special* VERT, which denotes all trees growing in the king's woods, within the foreſt; and thoſe that grow in other men's woods, if they be ſuch trees as bear fruit to feed the deer.

VERTEBRÆ*, a chain of little bones, reaching from the top of the neck, down the back, to the os ſacrum; and forming a third part of the human ſkeleton, called the *ſpina dorſi*. See SPINE.

* They have their name *à vertendo*; becauſe it is on them the head and trunk turn: the Greeks call them σπόνδυλοι, *ſpondyli*, for the ſame reaſon.

The *vertebræ* are 24 in number; ſeven of them belong to the neck, twelve to the back, and five to the loins. See NECK, LOINS, *&c.*

They lie not in a ſtrait line; thoſe of the neck bend inward, and thoſe of the back outwards, for enlarging the cavity of the thorax; and thoſe, again, of the loins bend inwards, and thoſe of the os ſacrum outwards, to enlarge the cavity of the baſon.

The body of each *vertebra* is ſpongious and cavernous; having in the middle a large perforation, through which the medulla ſpinalis paſſes, and ſeven apophyſes, or proceſſes.

The fore-part of this body is round and convex; the hind-part ſomewhat concave: its upper and lower ſides are plain, each covered with a cartilage which is pretty thick forwards, but thin backwards, by means whereof it is, that we bend the body forwards; the cartilages yielding to the preſſure of the bodies of the *vertebræ*, which, in that motion, come cloſer to one another: which could not be effected, if the hard bodies of the *vertebræ* were cloſe to one another.

The proceſſes of each *vertebra* are of three ſorts: two tranſverſe, or lateral; in each of which there is a tendon of the *vertebral* muſcles inſerted: four oblique ones; by which the *vertebræ* are articulated to one another: and one acute, on the hindmoſt part of the *vertebra*—. See *Tab. Anat.* (*Oſteol.*) *fig.* 10. *lit. a. a. b. b. fig.* 7. *lit. a. a. a. a. fig.* 7. *lit. n. n. o. o. o. r. r. ſ. ſ*, &c. *fig.* 11, *lit. b. b. c. c. fig.* 8. *lit. b. b. a. a.*

Theſe proceſſes, which are peculiarly called the *ſpines*, form, with the hinder or concave part of the body of the *vertebræ*, a large hole in each *vertebra*; and all the holes anſwering one another, make a channel for the deſcent of the ſpinal marrow, which ſends out its nerves to the ſeveral parts of the body by pairs, through two ſmall holes, formed by the jointing of four notches, in the ſides of each ſuperior and inferior *vertebra*. See MEDULLA *Spinalis*.

The *vertebræ* are articulated to one another, by ginglymus: for the two deſcending oblique proceſſes of each ſuperior *vertebra* of the neck and back, have a little dimple in their extremities, wherein they receive the extremities of the two aſcending oblique proceſſes of the inferior *vertebræ*; ſo that the two aſcending proceſſes of each *vertebra* of the neck, and back, are received, and the two deſcending do receive, except the firſt of the neck, and laſt of the back; but the aſcending proceſſes of each *vertebra* of the loins receive, and the two deſcending are received; contrary to thoſe of the neck, and back.

The *vertebræ* are all tied together by a hard membrane, made of ſtrong and large fibres: It covers the body of all the *vertebræ* forwards; reaching from the firſt of the neck, to the os ſacrum.—There is another membrane, which lines the canal, made by the large hole of each *vertebra*; which alſo ties them together: beſides, the bodies of each *vertebra* are tied to one another, by the intervening cartilages; and the tendons of the muſcles, which are inſerted in their proceſſes, tie them together behind.

This ſtructure of the ſpine is admirable; for had it been all one bone, we could have had no motion in our backs; had it been of two or three bones articulated for motion, the medulla ſpinalis muſt have been neceſſarily bruiſed at every angle, or joint; beſides, the whole would not have been ſo pliable, for the ſeveral poſtures we have occaſion to put ourſelves in: if it had been made of ſeveral bones, without intervening cartilages, we ſhould have had no more uſe of it, than if it had been but one bone.—If each *vertebra* had had its own diſtinct cartilages, it might have been eaſily diſlocated.—Laſtly, the olique proceſſes of each ſuperior and inferior *vertebra*, keeps the middle one, that it can neither be thruſt backwards nor forwards, ſo as to compaſs the medulla ſpinalis.

The *vertebræ* of the neck differ from the reſt, in that they are ſmaller and harder, their tranſverſe proceſſes perforated for the paſſages of the vertebral veſſels, and their acute proceſſes forked and ſtraight. See *Tab. Anat.* (*Oſteol.*) *fig.* 3. *n.* 1. 1. *fig.* 7. *n.* 14. 14. *fig.* 8. and *fig.* 9.

Add, that the firſt and ſecond have ſomething peculiar to themſelves.

The firſt, called *atlas*, is tied to the head; and moves with it upon the ſecond, ſemicircularly. See ATLAS.

The ſecond is called *epiſtrophæus*, *axis*, or *cardo*; alſo *vertebra dentata*: in the middle, between its two oblique aſcending proceſſes, it has a long and round proceſs like a tooth, which is received into a ſinus of the atlas; and upon it, the head with the firſt *vertebra*, turns half round, as upon a hinge, or axis. The extremity of this proceſs, is knit to the occiput, by a ſmall, but ſtrong ligament.—A luxation of this tooth is mortal, becauſe it compreſſes the medulla ſpinalis.

The third is alſo by ſome, though improperly, denominated *axis*.

The *vertebræ* of the back differ from the reſt in this, that they are larger than thoſe of the neck, and ſmaller than thoſe of the loins: their acute proceſſes ſlope downwards upon one another. They have in each ſide of their bodies a ſmall dimple, wherein they receive the round extremities of the ribs: the uttermoſt of them is ſometimes called the *creſt*; the ſecond the *axillaris*; and the reſt *coſtales*. See *Tab. Anat.* (*Oſteol.*) *fig.* 3. *n.* 13. 13. *fig.* 7. *n.* 15. 15. *fig.* 10.

The *vertebræ* of the loins, are the broadeſt; and the laſt of them, the largeſt of all the *vertebræ*. See *Tab. Anat.* (*Oſteol.*) *fig.* 3. *n.* 14. 14. *fig.* 7. *n.* 16. 16. *fig.* 11.

Though each *vertebra* has but a ſmall motion, yet the motion of them all is conſiderable; the head, we have obſerved, moves only backwards and forwards on the firſt *vertebra*, and ſemicircularly on the ſecond.—The motion of the other *vertebræ* of the neck is not ſo manifeſt, yet is greater than that of the *vertebræ* of the back; becauſe their acute proceſſes are ſhort and ſtraight, and the cartilages, which are between their bodies, thicker.—The *vertebræ* of the back have the leaſt motion of any, becauſe their cartilages are thin, their acute proceſſes long, and very near to one another: and they are fixed to the ribs, which neither move forwards, nor backwards.—The greateſt motion of the back, is performed by the *vertebræ* of the loins; becauſe their cartilages are thicker, and their acute proceſſes are at a greater diſtance from one another: for the thicker the cartilages are, the more we may bend the body forwards; and the greater diſtance there is between the acute proceſſes, the more we may bend backwards.

Such is the ſtructure and motion of the *vertebræ*, when in their natural poſition: but we frequently find them variouſly diſtorted.—If the *vertebræ* of the back ſtick out, it conſtitutes what we call a *bunched back*: and in ſuch caſes, the cartilages between the *vertebræ* are very thin and hard forwards, but conſiderably thick backwards, where the oblique proceſſes of the ſuperior and inferior *vertebræ*, are at a conſiderable diſtance from one another, which diſtance is filled up with a viſcous ſubſtance.

This inequality of the thickneſs of the cartilages happens, either by a relaxation, or a weakneſs of the ligaments and muſcles, faſtened to the back-ſide of the *vertebræ*: in which caſes, their antagoniſts finding no oppoſition, remain in a continual contraction.

The os ſacrum does alſo conſiſt of *vertebræ* in children; which grow ſo cloſe together in adults, that they make but one large and ſolid bone of the figure of an iſoſceles triangle, whoſe baſes is tied to the laſt *verterbra* of the loins, and the upper part of its ſides to the ilia, and its point to the os coccygis. See SACRUM *Os*.

VERTEBRALES, in anatomy, a pair of muſcles, whoſe office is to ſtretch out all the *vertebræ* of the back. See VERTEBRÆ.

VERTEX, in anatomy, the crown of the head; or that uppermoſt and middle part ſituate between the ſinciput and occiput. See HEAD.

Hence, alſo, *vertex* is figuratively uſed for the top of other things.— Thus, the *vertex* of a cone, pyramid, conic ſection, *&c.* is the point of the upper extremity of the axis; or the top of the figure. See CONE, PYRAMID, *&c.*

VERTEX *of an Angle*, is the angular point; or the point A, (*Tab. Geometry, fig.* 91.) wherein the legs meet. See ANGLE.

VERTEX *of a Figure*, is the *vertex* of the angle oppoſite to the baſe. See FIGURE.

Such is the point M, (*Tab. Geometry, fig.* 19.) oppoſite to the baſe KL. See BASS.

VERTEX *of a curve*, is the point A, (*Tab. Geometry, fig.* 51.) from which the diameter is drawn; or the interſection of the diameter, and the curve. See CURVE.

VERTEX *of a Glaſs*, in optics, the ſame with the pole thereof. See POLE, OPTIC *Glaſs*, &c.

VERTEX is alſo uſed, in aſtronomy, for that point of heaven perpendicularly over our heads; properly called the *zenith*. See ZENITH.

Path of the VERTEX. See the article PATH.

VERTICAL *Circle*, in aſtronomy, is a great circle of the ſphere, paſſing through the zenith Z, and nadir N, (*Tab. Aſtronomy, fig.* 6.) and any other given point on the ſurface of the ſphere, as B. See CIRCLE, and SPHERE.

The *vertical circles* are alſo called *azimuths*. See AZIMUTH.— The meridian of any place is a *vertical circle*. See MERIDIAN, *&c.*— All the *vertical circles* interſect each other in the zenith and nadir. See ZENITH, and NADIR.

The uſe of the *vertical circles* is to meaſure the heighth of the ſtars, and their diſtance from the zenith, which is reckoned on theſe circles; and to find their eaſtern and weſtern amplitude, by obſerving how many degrees the *vertical* wherein the ſtar riſes, or ſets, is diſtant from the meridian. See ALTITUDE, AMPLITUDE, *&c.*

Prime VERTICAL, is that *vertical* circle, or azimuth, which paſſes through the poles of the meridian; or which is perpendicular to the meridian, and paſſes through the equinoctial points. See PRIME *Vertical*.

VERTICAL *of the Sun*, is the *vertical* which paſſes through the centre of the ſun, at any moment of time.

Its uſe is in dialing, to find the declination of the plane whereon the dial is to be drawn; which is done by obſerving how many degrees that *vertical* is diſtant from the meridian, after marking the point, or line of the ſhadow upon the plane, at any times. See DECLINATION.

VERTICAL *Angles.*— Two angles, as, *o* and *x*, (*Tab. Geometry, fig.* 18.) are ſaid to be *vertical*, if the legs of one of them, AE and EC, be only continuations of the legs of the other, DE and BE. See ANGLE, and OPPOSITE.

VERTICAL *Plane*, in perſpective, is a plane perpendicular to the geometrical plane; paſſing through the eye, and cutting the perſpective plane at right angles. See PLANE.

VERTICAL *Plane*, in conics, is a plane paſſing through the vertex of the cone, and parallel to any conic ſection. See PLANE, and CONE.

VERTICAL *Line*, in conics, is a right line drawn on the *vertical plane*, and paſſing through the vertex of the cone. See LINE.

VERTICAL *Dial*, in a ſun-dial, drawn on the plane of a *vertical circle*; or perpendicular to the horizon. See DIAL, *&c.*

Theſe are particularly called *oriental*, eaſt; *occidental*, weſt; *meridional*, ſouth; and *ſeptentrional*, or north *verticals*, when oppoſed to one or other of theſe cardinal points of the horizon. See EAST, WEST, *&c.*

When they do not look preciſely to any of them, they are called *decliners*: and when their plane, or ſurface is not perfectly perpendicular, *recliners*. See DECLINER, RECLINER, *&c.*

VERTICAL *Point*, in aſtronomy, the ſame with *vertex*, or *zenith*.

Hence, a ſtar is ſaid to be *vertical*, when it happens to be in that point which is perpendicularly over any place.

VERTICAL *Line*, in dialing, is a line or any plane perpendicular to the horizon.

This is beſt found and drawn on an erect and reclining plane, by holding up a ſtring and heavy plummet ſteadily, and then marking two points of the ſhadow of the thread on the plane, a good diſtance from one other; and drawing a line through thoſe marks. See DIALING.

VERTICILLATE *Plants*, are ſuch as have their flowers intermixed with ſmall leaves, growing in a kind of whirls about the joints of a ſtalk; as penny-royal, hore-hound, *&c.* See PLANT.

The peculiar characteriſtic of this genus of plants, according to Mr. Ray, is, that their leaves grow by pairs, one juſt againſt another, on the ſtalk; the flower monopetalous, but uſually growing down with a kind of lip, or turning ſomething like the form of a helmet: four ſeeds after each flower; to which the perianthium of the flower ſerves inſtead of a capſula ſeminalis.

The ſame author makes two ſpecies of theſe *verticillate plants*.— 1°. The *fruticoſæ*, or ſuch whoſe ſuperficies is perennial: theſe, again, have either a plain flower, as the chamædrys vulgaris, thucrium, and the marum ſyriacum; or a flower with a lip, which they call a *labiated flower*; or one ſomething in the form of an helmet, which they call *galeated*; as the ſacria ſtæchas, hyſſopus, roſmarinus, ſatureia, marum vulgare, thymum vulgare, and the polium montanum.

2°. The *herbaceæ*, or ſuch whoſe ſtalks are not perennial; theſe are the menthæ, verbena, dictamnus creticus, origanum, majorana, ocimum, horminum, galeopſis, nepeta, betonica, prunella, ſtachys, clinopodium vulgare, lamium, moluca, hedera terreſtris, galericulata, calamintha, meliſſa, marrubium commune, nigrum & aquaticum; chamæpitys, ſcarodonia, ſcordium, bugula, ſyderitis, cardiaca.

VERTICILLATE *Flowers*. See FLOWER.

VERTICITY, is that property of the loadſtone, whereby it turns or directs itſelf to ſome peculiar point. See MAGNET.

The attraction of the magnet was known long before its *verticity*. See COMPASS, NEEDLE, *&c.*

VERTIGO*, in medicine, an indiſpoſition of the brain, wherein the patient ſees the objects about him as if they turned round, and fancies he turns round himſelf, though all the while at reſt.

* The word is Latin, formed *à vertendo*, from turning round.

Phyſicians diſtinguiſh two kinds, or rather, two degrees of *vertigoes*.— The firſt, called a *ſimple vertigo*, is when the body and external objects appear to turn round, without any great dimneſs of ſight.

The other, called *ſcotomia*, or *vertigo tenebroſa*, is when the eyes are alſo darkened; and, as it were, covered with a miſt. See SCOTOMIA.

Some make a third ſtage, *viz. vertigo caduca*, wherein the patient actually falls down.— But this ſeems ſcarce to differ from an epilepſy. See EPILEPSY.

Sometimes the *vertigo* is ſeated in the fore-part of the head, and ſometimes in the hind-part: where the latter is much the more dangerous.

Bellini accounts for the *vertigo* very well, from a preternatural motion in the retina: for it is evident, an object will ſeem to move circularly, if the images thereof, painted on the retina, fall ſucceſſively on different parts of the retina. See RETINA, and VISION.

This they may do, either by the object's moving while the eye is at reſt, or from the eye moving while the object reſts; or, laſtly, the object and eye being both at reſt, and the rays falling on the ſame place, by the optic nerve's being alone in motion. For ſince a right and an oblique incident do not excite the ſame tremors in the nerves, and the ſame ſpecies of motion; if the optic nerve only be moved, and the object be at reſt, it will appear to ſhift its ſituation, by the change of the place in which it was repreſented. See VISION.

External cauſes of *virtigines*, are a continued turning round of the body, drunkenneſs, too long faſting, immoderate exerciſe, ſurprize, voracity, much uſe of pulſe, onions, leeks, raddiſhes, cabbage, muſtard, *&c.* and, in the general, whatever may preſs, diſtend, or contract the arteries

The firſt ſtep in the cure, is bleeding in the jugular, or cupping; then they proceed to an emetic; then a veſicatory on the neck, or a perpetual bliſter, or iſſues; with ſternutatories, and the other medicines that obtain in the apoplexy. See APOPLEXY.

VERTILLAGE, in agriculture, the tilling, or preparing of ground to receive the ſeed, by turning, ſtirring, or toſſing it. See the article VIRTUE.

VERTUE. See the article VIRTUE.

VERTUOSO. See the article VERTUOSO.

VERU-MONTANUM, in anatomy, a kind of little valve, in the place wherein the ejaculatory ducts enter the urethra. See VALVE, URETHRA, *&c.*

Its uſe is, to prevent the urine, in paſſing the urethra, from getting in at thoſe ducts, and ſo mixing with the ſemen. See URINE, *&c.*

VERY* *Lord*, and VERY *Tenant*, are thoſe that are immediate lord and tenant to one another. See LORD, MESN, *&c.*

* "—And know ye, that in taking of leaſes ſix things are neceſſary, *viz. very, lord,* and *very tenant*; ſervice behind; the day of the taking; ſeiſin of the ſervices, and within his fee; and that a man is not *very tenant*, until he have attourned to the lord by ſome ſervice. *Old. Nat. Brev.* See TENANT, ATTOURNMENT, *&c.*

VESICA, in anatomy, a *bladder*; a membranous or ſkinny part, in which any humour is contained. See BLADDER, CYSTIS, &c.

VESICA *Bilaria*. See VESICULA *Fellis*.

VESICA, among chymiſts, is a large copper veſſel, tinned on the inſide; uſed in diſtilling ardent ſpirits: ſo called, as reſembling the figure of a blown bladder. See DISTILLATION.

VESICÆ *Fundus.*	See the article	FUNDUS.
VESICÆ *Sphincter.*		SPHINCTER.

VESICATORY, VESICATORIUM, an external medicine, ſerving to raiſe a bliſter; whence alſo it is itſelf, though improperly, called a *bliſter*. See EPISPASTIC.

Veſicatories are unguents, cataplaſms, or plaiſters made of ſharp, irritating medicaments, which have a faculty of drawing the humours from within, outwards; inflaming and ulcerating the ſkin, and raiſing veſicæ, or bladders; whence their denomination, *veſicatory*.

We have *veſicatories* made of cantharides, euphorbium, figs, ſublimate of mercury, lapis infernalis, muſtard, anacardium, ſquills, briony, vinegar, pepper, leaven, &c. which are incorporated and made up with honey, gums, reſins, &c. to bring them to the conſiſtence required. See CANTHARIDES, &c.

Veſicatories are a ſtronger ſort of ſinapiſms, and potential cauteries. See SINAPISM, CAUTERY, CAUSTIC, &c.

VESICULA, VESICLE, a diminutive of *veſica*; ſignifying a *little bladder*. See VESICA, and BLADDER.

The lungs conſiſt of *veſiculæ*, or lobules of *veſiculæ*, admitting air from the brochiæ; and not only air, but alſo duſt, &c. See LOBULE, and LUNGS.

There are ſeveral parts in the body which bear this appellation; as,

VESICULA *fellis*, *ciſtula fellis*, or the *gall-bladder*; which is an oblong membranous veſſel, not unlike a pear both in form and ſize; ſituate in the hollow part of the liver. See LIVER.

It adheres to the liver, not only by its veſſels, which it receives from it, but likewiſe by its membranes, whereof, the external is common to both.— The lower part, which hangs out of the liver, reſts on the pylorus of the ſtomach.

Its trunks, or membranes, are uſually reckoned five; an outer, or common one, from the peritonæum; an inner one, on that ſide which adheres to the liver from the capſula of the porta, and of the porus bilarius.— And three proper ones: the firſt whereof is vaſculous; the ſecond, muſcular; and the third, glandulous.

But Dr. Drake, viewing a piece of dried gall-bladder with a microſcope, found but little reaſon for this accurate diſtinction; the ſeveral orders of fibres of the ſeveral coats appearing to be no other than an infinite perplexity of veſſels diverſly ramified.

The gall-bladder is uſually diſtinguiſhed into the *fundas*, which is the wideſt part; and *collum*, or neck, which is the narroweſt.

The neck of the *veſicula fellis* being prolonged, terminates in a duct, called *meatus cyſticus*, or *bilarius*; which, at about two inches diſtance from the gall-bladder, is joined to the meatus hepaticus; theſe, together, form the ductus communis. See DUCTUS, MEATUS, &c.

The uſe of the gall-bladder, is to receive the bile, after its being ſecreted in the glands of the liver; and to diſcharge it by the common duct into the duodenum,

The bile found in this veſſel is of a brighter yellow, a greater conſiſtence, and more bitter and acrimonious than that in the porus bilarius. See BILE.

VESICULÆ *Seminales*.— See *Tab. Anat. (Splanch.) fig.* 8. *lit. o. o. fig.* 15. *lit. bb*; ſee alſo the article SEMINALES.

VESICULÆ *Adipoſæ*. See the article ADIPOSÆ.

VESICULAR *Glands*. See the article GLAND.

VESPER, in aſtronomy, called alſo *heſperus*, and the *evening-ſtar*; is the planet Venus, when ſhe is eaſtward of the ſun, and conſequently ſets after him. See VENUS, and HESPER.

VESPERS, in the Romiſh church, *evening ſong*; that part of the office which is rehearſed after noon— anſwering to our *evening prayers*; except that it differs more from the office of the morning, called *mattins*. See MATTINS.

Silician VESPERS, is a famous æra in the French hiſtory; ſignifying a general maſſacre of all the French in Sicily, in the year 1282; to which the firſt toll that called to *veſpers* was the ſignal.

Some will have it to have happened on Eaſter-eve: others on the day of the Annunciation.— It was raiſed by one Prochites, a cordelier, at the time when Charles of Anjou, count of Provence, was king of Naples and Sicily.— The women with child by French-men were not ſpared.

After the like manner, we ſay, the *mattins of Moſcow*, ſpeaking of the Muſcovites aſſaſſinating their prince Demetrius, and all the Poles, his adherents, at Moſcow, the 27th of May 1600, under the conduct of their duke Choutſky, at ſix a-clock in the morning.

VESPERTILIONUM *Alæ*, *bats wings*, among anatomiſts, two broad membranous ligaments, with which the bottom of the womb is tied to the bones of the ilium; ſo called from their reſembling the wings of a bat.— See *Tab. Anat. (Splanch.) fig.* 11. *lit. g. g.* UTERUS.

VESPERTINE, VESPERTINUS, in aſtronomy, is when a planet is ſeen deſcending to the weſt after ſun-ſet.

VESSEL, VAS, VASE, a thing proper to hold, or contain liquor. See VAS, VASE, VESICA, VESICULA, &c.

Thus, a tun, hogſhead, &c. are *veſſels*, fit to contain ale, wine, &c. See TUN, BARREL, &c.

The chymiſts uſe a great diverſity of *veſſels* in their operations; as matraſſes, pelicans, retorts, receivers, &c. See MATRASS, PELICAN, &c.

Double VESSEL. See the article DOUBLE.

Among anatomiſts, &c. all the tubes or canals, wherein the blood, and other juices, or humours are ſecreted, conveyed, depoſited, &c. as the veins, arteries, lymphatics, ſpermatics, &c. are called *veſſels*.— See *Tab. Anat. P.* 2. *Veſſels of human body*; ſee alſo TUBE, CANAL, DUCT, VEIN, VESICULA, &c.

Some even extend the word *veſſel* to the nerves; as ſuppoſing them the conduits of the animal ſpirits. See NERVE.

Veſſels conſiſt of membranes, variouſly formed, and diſpoſed for the reception of the fluids; and theſe membranes, again, conſiſt of leſſer veſicles, or veſiculæ: and this, for what we know, without end. See MEMBRANE, FLUID, &c.

In the new ſyſtem of many modern philoſophers and phyſicians, *veſſel* is a name common to all the ſolid parts of the body. See SOLID.

Theſe authors explain the whole animal œconomy, functions, &c. from the divers liquors diffuſed throughout the body, and the various tubes, or *veſſels* which contain thoſe liquors.— In effect, all we know in the human body, is either *veſſel*, or liquor. See DIGESTION.

The antients, it is true, had a notion, that ſome parts of the body, as the heart, ſpleen, &c. are mere parenchyma's, *i. e.* a kind of pulp, or pith, void of all *veſſels*; but the moderns, by the advantage of microſcopes, injections, &c. find that theſe, and all other parts of the body, are mere congeries, or maſſes of *veſſels* interwove. See PARENCHYMA, FLESH, &c.

Some philoſophers even extend the modern ſyſtem to all material beings; owning, only two elements, *viz.* a matter infinitely liquid, diffuſed through all nature; and hard, or ſolid parts; which are, as it were, the *veſſels* of that matter. See ELEMENT, &c.

The *veſſels* have a conſiderable ſhare in the vital actions; all that is required to the maintenance of life, being a due quantity of a proper humour and its continued motion along the *veſſels*: this motion depends in great meaſure, on the action of the *veſſels* themſelves; and the action of the *veſſels*, depends on the contraction of the fibres, whereby, when ſtretched and diſtended by the flowing humour, they ſhorten themſelves again, and diſpute themſelves into right lines, ſtill approaching towards the axis of their cavity; and thus, they propel their contents: ſo that the force of the *veſſels* is chiefly to be determined from their figure. See FIBRE, ELASTICITY, &c.

The number of *veſſels*, ſome of our lateſt and beſt anatomiſts obſerve, is greateſt in embryos; and continually decreaſes as age [illegible] See FOETUS.

For in th[illegible]ons whereby nutrition, &c. are effected, the greater *veſſels* being much diſtended by their humours, the ſmaller veſicles, whereof the membranes, or coats of the larger are wove, become compreſſed and ſtreightened, and at length quite dry, and void of juices; ſo that growing together, the fibres become the firmer and ſtronger, by the loſs of the veſicles.— And hence the ſtrength, firmneſs, ſtiffneſs &c. of the ſolid parts. See SOLID; ſee alſo DISEASE, and DEATH.

Axis of a VESSEL.	See the article	AXIS.
Capillary VESSELS.		CAPILLARY.
Cervical VESSELS.		CERVICAL.
Phrenic VESSELS.		PHRENIC.
Pulmonary VESSELS.		PULMONARY.
Spermatic VESSELS.		SPERMATIC.
Umbilical VESSELS.		UMBILICAL.

VESSEL, in navigation, is a name common to all ſorts of ſhipping, *i. e.* all floating machines, or vehicles that move in the water. See Ship.

Veſſels are frequently diſtinguiſhed in two general claſſes, *viz. high-bottomed* or *decked veſſels*; which are thoſe that move wholly with wind and ſail, and live in all ſeas; as *pinks*, *gallions*, *ſhips*, &c. See SAILING.

And *flat-bottomed veſſels*, which go both by oars and ſails: ſuch are *boats*, *galleys*, *praams*, *wherries*, &c. See OARS, ROWING, &c. ſee alſo BOAT, GALLEY, &c.

Floating veſſels, are uſually diſtinguiſhed into *boats*, *lighters*, *barges*, *barks*, *fiſhing veſſels*, *ſhips of trade*, and *veſſels of war*; of each whereof there are divers kinds and denominations. See BOAT, BARGE, LIGHTER, SHIP, &c.

Veſſels of war, are a *three-decked ſhip*, firſt and ſecond rate; a *frigate*, a *frigate*, or *two decked ſhip*, third, fourth, and fifth rate; a *one decked ſhip*, ſixth rate; a *boom-veſſel*, a *fire-ſhip*, a *ketch*, a *machine-veſſel*, a *ſmoaker*. See RATE.

A *veſſel* is ſaid to be *of three or four hundred tuns*; meaning that it will carry three or four hundred times two thouſand weight: or, that when immerged in water, it poſſeſſes the ſpace of three or four hundred tun of water, which is equal to the weight of the *veſſel*, and all the loading it can carry. See TUN, and BURDEN.

A *veſſel* is ſaid to *draw ten or fiteen feet water*; meaning, that when loaden, it ſinks ſo deep under water.

The figure of *veſſels*, is a thing of great importance, with regard to their motion, ſailing, *&c.* and in the determining what form is moſt commodious, the new doctrine of infinites becomes of apparent ſervice to navigation and commerce.

A body moving in an immoveable fluid, is obliged to ſever the parts thereof; and they reſiſt ſuch ſeparation.— Now, ſetting aſide a certain tenacity, whereby they are, as it were, glued together; and which is different in different fluids; the whole force of the reſiſtance depends on that of the ſhock, or impulſe: for a body that is ſtruck, ſtrikes at the ſame time; but a perpendicular ſtroke is that a liquid reſiſts the moſt, as being the greateſt: and for a body to move freely therein, it muſt be of ſuch figure, as to preſent itſelf as obliquely as poſſible.— If it were triangular, and moved with the point foremoſt, it is certain all its parts would ſtrike the fluid obliquely, but they would all ſtrike it with the ſame obliquity; and it were more advantageous, that each ſhould ſtrike more obliquely than its neighbour.

Now, ſuch a perpetual augmentation of obliquity, can no where be had in a curve line; each point whereof is conſidered as an infinitely ſmall right line, always inclined to the other little right lines contiguous to it.

To find what curve it is, whoſe perpetual change of obliquity, or inclination in all its parts, renders it, of all others, the fitteſt to divide the fluid eaſily; is a problem much more difficult than it appears to be; and, in effect, only to be ſolved by the new geometry: the ſolution was firſt given by Sir Iſaac Newton, in his inveſtigation of the ſolid of the leaſt reſiſtance.

That author, however, did not publiſh his analyſis; yet the marquis de l'Hôpital hit upon it: and afterwards M. Fatio reſolved the ſame problem; though by a much longer, and more perplexed way. See SOLID *of the leaſt reſiſtance.*

Book of VESSELS. See the article BOOK.

VEST, and VESTITURE. See the article INVESTITURE.

VESTALIA, feaſts held in honour of the goddeſs Veſta, on the fifth of the ides of June; *i. e.* on the ninth day of that month. See FEAST.

On that day, banquets were made before the houſes; and meats ſent to the veſtals, to be offered by them to the goddeſs. See VESTAL.

The aſſes that turned the mills for grinding corn, were, on this occaſion, led about the city, crowned with flowers, and chaplets formed of pieces of bread; and the mill-ſtones were likewiſe decked with garlands and crowns.

The ladies went barefooted in proceſſion to the temple of Veſta; and an altar was erected to Jupiter *the baker*, *Jovi piſtori*, in the capitol.

The *veſtalia* had their name from that of their goddeſs Veſta, from the Greeks called ἑϛία, fire, or hearth; whence Cicero derives the Latin name.— Accordingly, the poets frequently uſe *Veſta* for fire, or flame; as *Jupiter*, for air, *Ceres*, for corn, *&c.* See GOD, *&c.*

VESTALS, VESTALES, in antiquity, maids in antient Rome, conſecrated to the ſervice of the goddeſs Veſta; and particularly, to watch the ſacred fire in her temple. See VESTALIA.

Numa firſt inſtituted four *veſtals*; and Plutarch tells us, Servius Tullus added two more: which number, ſix, laſted as long as the worſhip of the goddeſs Veſta.— It is true, S. Ambroſe reckons them ſeven; but without any foundation.

The *veſtals* made a vow of perpetual virginity: their employment was, the ſacrificing to Veſta, and keeping up the holy fire in her temple.— If they violated the vows of chaſtity, they were puniſhed with remarkable ſeverity; being ſhut up, or buried in a deep pit, or cavern, with a lighted lamp, and a little water and milk, and their left to be devoured by hunger.— If they let out the fire, they were whipped by the pontifex maximus; and the fire was re-kindled by the ſun-beams collected, ſome ſay, in burning-glaſſes, and not otherwiſe.

To be ſecure of their virginity at their admiſſion, it was provided, that they ſhould not be above ſix years old.— They were choſen by lot, out of 20 virgins, carried by the pontiff to the comitia, for that purpoſe.

They were only conſecrated for 30 years; after which time, they were at liberty to go out and be married. If they continued in the houſe after that time, they were only to be aſſiſtant, in point of advice, to the other *veſtals*.

The firſt ten years they were to employ in learning their functions; the ten following they were to exerciſe them; and the laſt ten, to teach them to others.

Their order was very rich; both on account of the endowments of the emperor, and of other perſons.

The *veſtals* had a particular place allotted them at the amphitheatres, and games of the circus.— Their vehicle was the carpentum, or pilentum.—The vail wherein they ſacrified, was called *ſuffibulum.*

At firſt, they were nominated by the kings; but after the extinction of monarchy, by the pontifex maximus, or high prieſt.— The oldeſt of them was called *maxima*, as the firſt pontiff was maximus. See PONTIFF.

They had divers privileges; diſpoſed of their effects by teſtament, in their father's life-time; had the ſame gratification as a mother of three children; and whenever they met a criminal going to execution, had a power to pardon him.

The fire which the *veſtals* were to watch, was not on an altar, or hearth; but in little earthern veſſels with two handles, called *capeduncula.*

This fire was held a pledge of the empire of the world. If it went out, it was judged a very unlucky prognoſtic; and was to be expiated with infinite ceremonies.— Among the Romans, Feſtus tells us, it was only to be re-kindled by the rubbing a kind of wood, proper for the purpoſe. But among the Greeks, Plutarch, in the life of Numa, obſerves, it was to be rekindled, by expoſing ſome inflammable matter, in the centre of a concave veſſel held to the ſun.— For it is to be noted, the Romans were not the only people who kept the perpetual fire of Veſta, in imitation of the celeſtial fires: but the Greeks were poſſeſſed with the ſame ſuperſtition; particularly the Delphians, Athenians, Tenedians, Argives, Rhodians, Cyzicenians, Mileſians, Epheſians, *&c.*

VESTIARIUS, VESTIARY, in antiquity, maſter of the wardrobe; an officer under the Greek empire, who had the care and direction of the emperor's apparel, robes, *&c.* See WARD-ROBE.

The *protoveſtiarius*, or *firſt veſtiary*, was the grand maſter of the wardrobe.— But, among the Romans, *veſtiarius* was only a ſaleſman, or taylor.

VESTIBLE*, VESTIBULUM, in the antient architecture, a large open ſpace before the door, or entrance of a houſe.

* Martinius derives the word from *veſtæ ſtabulum*; by reaſon the fore-part of the houſe was dedicated to *Veſta.*— Daviler derives it from *veſtis*, and *ambulo*; by reaſon people there begin to let their trains fall.

The Romans had places called *viſtibles*, at the entrance of their houſes, to ſhelter people obliged to ſtand at the door from the weather: we have ſtill *veſtibles* of the like kind, in many old churches, houſes, *&c.* called *porches*. See PORCH, and PROPYLÆUM.

Veſtibles only intended for magnificence, are uſually between the court and the garden: theſe are ſometimes *ſimple*; that is, have their oppoſite ſides equally enriched with arches; and ſometimes their plan is not contained under four equal lines, or a circular one, but forms ſeveral van-corps, and rear-corps, furniſhed with pilaſters.

VESTIBLE, VESTIBULUM, in anatomy, denotes the fore-part of the labyrinth of the ear. See EAR, and LABYRINTH.

The *veſtible* is a ſmall cavity, of an irregular form, placed immediately above the baſis of the ſtapes; between the ſemicircular canals, and the cochlea. See COCHLEA.

In it appears divers foramina; as that of the feneſtra ovalis; the five foramina of the ſemicircular canals; that of the cochlea; and five other very ſmall ones, through which ſo many nerves paſs. See FENESTRA, *&c.*

VESTIGIA, a Latin term, frequently uſed by Engliſh writers, to ſignify the traces, or footſteps any thing has left behind it. See TRACE.

The word is particularly applied to the marks remaining of ſomething antique, gone to ruin by time. See RUIN.

VESTIS *Angelica.* See the article ANGELICA.

VESTMENT. See the article VESTURE.

VESTRY, VESTIARIA, a room adjoining to a church, where the prieſts veſtments, and ſacred utenſils are kept, and parachial aſſemblies held. See SACRISTY, and VESTRY-*Men.*

VESTRY-*Men*, a ſelect number of the principal perſons of every pariſh within the city of London, and elſewhere; who yearly chuſe pariſh-officers, and take care of its concernments. See PARISH.

They are thus called, becauſe they uſually meet in the *veſtry* of the church. See SACRISTY.

VESTRY-*Clerk*, an officer who keeps the pariſh accounts. See PARISH, CLERK, *&c.*

VESTURE, VESTMENT, a garment, or cloathing.

In our law-books, it is alſo uſed metaphorically: as in, *veſtura terræ*, i. e. *ſegetes quibus terr veſtitur*; the corn wherewith the earth is clothed, or covered.

VESTURE *of an Acre of Land*, is the produce on it; or the wood, corn, *&c.* growing on it.— It ſhall be enquired how much the *veſture* of an acre of ground, and how much the land, &c. 4 Ed. I. 14 Ed. III. &c.

Vesture, Vestura, alſo ſignifies a poſſeſſion, or ſeiſin. See Possession, and Seisin.

In which ſenſe, it is borrowed from the feudiſts; with whom *inveſtitura* ſignifies a delivery of poſſeſſion by a ſpear or ſtaff; and *veſtura*, poſſeſſion itſelf. Investiture.

VETERAN, Veteranus, in the Roman militia, a ſoldier who was grown old in the ſervice; or who had made a certain number of campaigns; and on that account was entitled to certain benefits and privileges.

Twenty years ſervice, were ſufficient to entitle a man to the benefits of a *veteran.*— Theſe privileges conſiſted in being abſolved from the military oath; in being exempted from all the functions of a ſoldier; in enjoying a certain ſalary, or appointment, &c.

In France, the term Veteran is ſtill retained to ſuch officers as have held their poſts 20 years; and who enjoy certain of the honours and privileges affixed thereto, even after they have laid them down.

A *veteran* counſellor has a voice and ſeat at audiences, though not at proceſſes by writing.— A *veteran* ſecretary of the king, acquires the privileges, &c. of nobility, to himſelf and his children.

VETERINARIA, *Mulo-medicina*, or medicine applied to the diſeaſes of cattle. See Medicine, Horse, &c.— Whence,

VETERINARIUS, a farrier, or horſe-leech. See Farrier.

VETERNUS, is uſed by ſome phyſicians for a lethargy, or other drouſy diſeaſe. See Lethargy, &c.

VETITUM *Namium*, in law, imports a forbidden diſtreſs. See Nam and Distress.

Such, *e. gr.* is that when the bailiff of a lord diſtrains beaſts, or goods, and the lord forbids his bailiff to deliver them when the ſheriff comes to replevy them; and to that end, drives them to places unknown: — Or when, without any words, they are ſo eſſoined, as they cannot be replevied.

Divers lords of hundreds, and courts-baron, have power to hold plea *de* vetito namio.— *Mathilda de Morton clamat in manerio de Mawerdon duos* law-days, *& infangentheft & placita de* namio vetito, *ſine breve domini regis.* Int. Record. in Theſaur. Scac.

VEXES. See the article Ne Injuste *Vexes.*

Vi et Armis, q. d. *by force and arms*, a law term uſed in an indictment; to denote the forcible and violent commiſſion of any crime. See Trespass, and Indictment.

Vi Laica *removenda*, a writ, lying where debate being between two parſons, or proviſors for a church; and of them makes a forcible entry into it, with a number of laymen, and holds the other out.

VIA, *Way.* See the articles Way, and Road.

Via Lactea, in aſtronomy, the *milky way*, or galaxy. See Galaxy.

Via Militaris, in our law-books, is uſed for a *highway— quæ publica dici poterit & ducit ad mare & ad portum, & quandoque ad mercata.* Bracton, Lib. IV. c. 16.

Via Regia, the *king's highway*, is defined in *Leg. Hen.* I. to be "that which is always open, and which no body may "ſhut by any threats, as leading to a city, port, or town."

Its breadth the ſame laws preſcribe to be ſuch, as that two carts may paſs each other, and ſixteen horſemen armed go abreaſt.

Via Solis, the *ſun's way*, in aſtronomy, is uſed, among ſome aſtronomers, for the ecliptic line; ſo called, becauſe the ſun never goes out of it. See Ecliptic.

Viæ Primæ, *firſt paſſages*, among phyſicians, are the œſophagus, ſtomach, and guts; including the whole length of the alimentary duct, or canal, from the mouth to the ſphincter ani. See Duct, Stomach, Intestines, &c.— ſee alſo Primæ.

In this ſenſe, we ſay, An obſtruction in the *primæ viæ.*— Purging and emetic medicines operate chiefly on the *primæ viæ*— Sudorifics, alteratives, cardiacs, &c. ſuſpend their action till after they have paſſed the *primæ viæ.* See Medicine, Purgative, Emetic, &c.

VIAL, or **Phial**, a ſmall thin glaſs bottle. See Phial.

VIALES, in mythology, a name given, among the Romans, to the gods who had the care and guard of the roads, and highways. See God.

The *dii viales*, according to Labeo, were of the number of thoſe gods called *dii animales*; who were ſuppoſed to be the ſouls of men changed into gods; and were of two kinds, *viz.* the *viales*, and *penates.* See Penates.

The *viales* were the ſame with thoſe otherwiſe called *lares*; at leaſt, ſome of the *lares* were denominated *viales*, viz. ſuch of them as had the more immediate intendency of the roads. See Lares.

Hence, the two names are ſometimes joined, and thoſe highway deities called *lares viales*: witneſs that inſcription in Gruter.

IONI.

VIATICUM, among the antient Romans, was the allowance or appointment which the republic gave to ſuch of its officers as were ſent into the provinces, to exerciſe any office, or perform any ſervice, or commiſſion; as alſo to the officers of the army, and even the ſoldiers, &c. See Province.

Tacitus makes mention of it, Lib. I. *Annal.* c. 37. *Viaticum amicorum ipſiuſque Cæſaris*; meaning the appointments which the republic paid to Germanicus, and his officers.

This *viaticum*, however, did not conſiſt altogether in money: the ring given the magiſtrates and officers ſent into the provinces, was part of it; ſo were the clothes, baggage, tents, and the reſt of their equipage.

In the Romiſh church, Viaticum is ſtill the allowance made a religious, to defray the expences of a journey, miſſion, &c. See Mission.

Viaticum is alſo uſed for the communion, or euchariſt, which is given to the people in the pangs of death; or who are about to make the voyage of the other world. See Communion.

The *viaticum* is not given to perſons executed in courſe of juſtice.

VIATOR, in antiquity, on officer of juſtice among the Romans.— The term, originally, had no other ſignification than that of a publick meſſenger, or ſervant ſent to advertiſe the ſenators and magiſtrates when aſſemblies were to be held, where their preſence was required.

Hence, becauſe, in the firſt ages of that empire, the Roman magiſtrates lived moſtly at their country-houſes; theſe officers being obliged to be frequently upon the road, were called *viatores*, travellers; from *via*, highway.

In proceſs of time, the name *viator* became common to all officers of the magiſtrates, lictors, accenſi, ſcribes, ſtatores, and cryers; either by reaſon theſe names and offices were confounded in one: or becauſe *viator* was a general name, and the reſt particular ones, ſpecifying the particular functions they diſcharged, as A. Gellius ſeems to inſinuate, when he ſays, that member of the company of *viatores*, who binds a criminal condemned to be whipped, was called *lictor.* See Accensi, Scribe, &c.

Be this as it will, the names *lictor* and *viator* are often uſed indiſcriminately for each other; and we as often meet with *Send to ſeek, or advertiſe him by a lictor*, as *by a* viator.

None but the conſuls, pretors, tribunes, and ædiles, had a right to have *viators.*— They were not to be Roman citizens, and yet were required to be free.

VIBEX, is ſometimes uſed, by phyſicians, for a black and blue ſpot on the ſkin, occaſioned by an afflux, or extravaſation of blood. See Petechia, &c.

VIBRATION, in mechanics, a regular, reciprocal motion of a body; *e. gr.* a pendulum; which, being ſuſpended at freedom, ſwings or *vibrates*, firſt this way, then that.

For the bob being raiſed, falls again by its gravity; and with the velocity thus acquired, riſes to the ſame heighth on the other ſide; whence, its gravity makes it fall again: and thus its *vibrations* are continued. See Pendulum.

Mechanical authors, in lieu of *vibration*, frequently uſe the term *oſcillation.* See Oscillation.

The *vibrations* of the ſame pendulum are all iſochronal; that is, performed in equal time, at leaſt in the ſame climate; for, towards the equator, they are found ſomewhat ſlower.

A pendulum 3 feet 3 inches, and 2 tenths of an inch, according to Huygens, or 39, 25 inches, according to Sir J. Moor and lord Brouncker, *vibrates* ſeconds, or makes 3600 *vibrations* in an hour. See Second.

The *vibrations* of a longer pendulum, take up more time than thoſe of a ſhorter one, in the ſubduple ratio of the lengths.— Thus, a pendulum 3 feet long will make 10 *vibrations*; while another 9 inches long makes 20.— For 10 is the half of 20, and 3 feet, or 36 inches, are the ſquare of 6 inches; which is double of 3, whoſe ſquare is 9: ſo that 10 is to 20 in a ſubduble ratio of 36 to 9.

The ſame thing is meant, when we ſay, that the number of *vibrations* of pendulums in a given time, is in a reciprocal ratio of their lengths.

M. Mouton, a prieſt of Lyons, wrote an expreſs treatiſe, to ſhew, that by means of the number of *vibrations* of a given pendulum, in a certain time, one might eſtabliſh an univerſal meaſure throughout the whole world; and fix the ſeveral meaſures in uſe among us, in ſuch manner, as that they might be recovered again, if at any time they ſhould chance to be loſt, as is the caſe of moſt of the antient meaſures, which we now only know by conjecture. See Measure.

The Vibrations *of a ſtretched cord*, or *ſtring*, ariſe from its elaſticity; which power being of the ſame kind with that of gravity, the *vibrations* of a cord follow the ſame laws as thoſe of pendulums: conſequently the *vibrations* of the ſame cord equally ſtretched, though they be unequal in length, are equidiurnal, or performed in equal times; and the ſquares of the times of the *vibrations* are among themſelves, inverſly, as the powers whereby they are equally bent, and inflected. See CHORD, ELASTICITY, FIBRE, *&c.*

The *vibrations* of a ſpring, too, are proportionable to the powers whereby it is bent: theſe follow the ſame laws as thoſe of the cord, or pendulum, and, conſequently, are equidiurnal; which is the foundation of ſpring-watches. See SPRING, and WATCH.

VIBRATION is alſo uſed in phyſics, *&c.* for divers other regular alternate motions.— Senſation is ſuppoſed to be performed, by means of the *vibratory* motion of the nerves, begun by external objects, and propagated to the brain. See SENSATION, VISION, NERVE, &c.

The ſeveral ſorts and rays of light, Sir Iſaac Newton conceives to make *vibrations* of ſeveral bigneſſes; which, according to thoſe magnitudes, excite ſenſations of ſeveral colours; much after the ſame manner as *vibrations* of air, according to their ſeveral magnitudes, excite ſenſations of ſeveral ſounds. See COLOUR, SOUND, &c.

Heat, according to the ſame author, is only an accident of light, occaſioned by the rays putting a fine, ſubtile etherial medium, which pervades all bodies, into a *vibrative* motion, which gives us that ſenſation. See MEDIUM, and HEAT.

From the *vibrations*, or pulſes of the ſame medium, he accounts for the alternate fits of eaſy reflection, and eaſy tranſmiſſion of the rays. See LIGHT, RAY, REFLECTION, &c.

In the *Philoſophical Tranſactions* it is obſerved, that the butterfly, into which the ſilk-worm is transformed, makes 130 *vibrations*, or motions of its wings, in one coition.

VICAR*, VICARIUS, a perſon appointed as deputy of another; to perform his functions, in his abſence, and under his authority. See LIEUTENANT, DEPUTY, VICE-GERENT, &c.

* The word is formed from *vicarius, qui alterius vices geret.*

The pope pretends to be *vicar* of Jeſus Chriſt on earth.— He has under him a *grand-vicar*, who is a cardinal, and whoſe juriſdiction extends over all prieſts, both ſecular, and regular; and even over laymen.

Among the antient Romans, *vicarius*, *vicar*, was a legatus, or lieutenant, ſent into the provinces where there was no governor: ſo that the *vicarii* were properly the emperor's *vicars*, not thoſe of governors. *Cod. de Offic. Vicar.*

Italy, in the time of the eaſtern empire, was governed by two *vicarii:* the one *vicar of Italy*, who reſided at Milan; the other of the city, who reſided at Rome.

Cujas obſerves, that the word *vicar* was ſometimes, though rarely, attributed to the lieutenant-generals of proconſuls, or governors of Roman provinces.

VICAR, in the canon law, denotes a prieſt of a pariſh, the predial tithes whereof are impropriated, or appropriated; that is, belong either to a chapter, religious houſe, *&c.* or to a layman, who receives them, and only allows the *vicar* the ſmall tithes, or a convenient ſalary, antiently called *portio congrua*. See TITHE, APPROPRIATION, &c.

He is thus called *quaſi vice fungens rectoris*, as ſerving for, or in lieu of a rector, who would be intitled to the great tithes. See RECTOR, and PARSON.

Theſe *vicars* were antiently called *perpetuii vicarii*; becauſe not appointed by the impropriator, and licenſed by the biſhop to read ſervice; but preſented by the patron, and canonical inſtitution given them by the hands of the ordinary; and ſo having conſtant ſucceſſion, or corporations, and never dying. See INDUCTION, CURE, &c.

The canoniſts mention four ſpecies of *vicars:* ſome *perpetual*; others appointed for a certain time, and, on ſome ſpecial occaſion, called *mercenarii*; others called *ſpeciales*, appointed not for the whole cure, but for ſome certain place, article, or act: others *generales*, neither perpetual, nor appointed for any certain act, but for all things in the general.

VICAR *General*, was a title given by king Henry VIII. to Thomas Cromwell, earl of Eſſex; with full power to overſee the clergy, and regulate all matters relating to church affairs.

VICE, VITIUM, in ethics, is ordinarily defined an elective habit, deviating, either in exceſs, or defect, from the juſt medium wherein virtue is placed. See VIRTUE.

It is called a *habit*, to diſtinguiſh it from *ſin*, which is only an act: hence, a ſin is looked on, as ſomething tranſient: and a *vice*, as ſomething permanent. See SIN, HABIT, &c.

Authors diſtinguiſh three ſtates of *vice:* the firſt *incontinentiæ*, of incontinence; wherein a perſon ſees, and approves the good, but is hurried to evil by the violence of his paſſions. — The ſecond, *intemperantiæ*, of intemperance; wherein even the judgment is depraved, and perverted.— The third, *feritatis*, of obduracy; wherein the perſon is totally immerſed in *vice*, without any ſenſe or feeling thereof.

The ſtate of incontinency, is conſidered as infirmity, wherein the perſon feels the ſharpeſt ſtings of conſcience: that of intemperance, as malice, wherein the remorſe is not ſo lively.— In that of obduracy there is none. See CONSCIENCE.

VICE, in ſmithery, and other arts employed in metals, is a machine, or inſtruments, ſerving to hold faſt any thing they are at work upon; whether it be to be filed, bent, riveted, *&c.*

To file ſquare, it is abſolutely neceſſary the *vice* be placed perpendicular, with its chaps parallel to the work-bench. See FILING.

The parts of the *vice* are, the *face*, or *plane*, which is its uppermoſt part; the *chaps*, which are cut with a baſtard cut, and well tempered; the *ſcrew-pin*, cut with a ſquare ſtrong worm; the *nut*, or *ſcrew-box*, which has a ſquare worm, and is brazed into the round box; the *ſpring*, which throws the chaps open; and the *foot*, on which the whole is mounted.

Hand-**VICE**, is ſmall kind of *vice*, ſerving to hold the leſſer works in, that require often turning about.

Of this there are two kinds, the *broad chapt hand-vice*, which is that commonly uſed; and the *ſquare noſed hand-vice*, ſeldom uſed but for filing ſmall round work.

VICE is alſo a machine uſed by the glaziers, to turn, or draw lead into flat rods, with grooves on each ſide, to receive the edges of the glaſs. See LEAD.

This machine conſiſts of two iron chaps, or cheeks, joined with two croſs iron pieces.— In the ſpace between the chaps, are two ſteel wheels, with their ſpindles, or axes paſſed through the middle; each of which has its nut, or pinion with teeth, that catch into each other: to the loweſt is fitted a handle, whereby the machine is turned.

There are ſome of theſe *vices* double, and that will draw two leads at once: theſe have three wheels.— Some glaziers will turn lead of different ſizes in the ſame *vice*; by changing their cheek for each ſize. See CHEEK.

With another pair of ſpindles, whoſe nuts almoſt meet, they turn lead for *tiers*; which, when it comes out of the *vice*, is almoſt cut aſunder, in two thickneſſes, eaſy to be parted.

Before the invention of this *vice*, which is but a late thing, they uſed a plane: accordingly, in all antient windows, we find the lead planed, and groved that way. See GLASS.

VICE is alſo uſed in the compoſition of divers words, to denote the relation of ſomething which comes inſtead, or in the place of another.

In this ſenſe, the word is Latin, *vice*, ſtead, place, turn, *&c.*

VICE ADMIRAL, is one of the three principal officers of the royal navy; who commands the ſecond ſquadron, and has his flag ſet up in the fore-top of his ſhip. See ADMIRAL, NAVY, &c.

VICE-CHAMBERLAIN, called alſo, in antient ſtatues, *under-chamberlain*; is an officer in the court, next under the lord chamberlain; and, in his abſence, has command, and controll, of all officers belonging to that part of the houſhold, called the *chamber* above ſtairs. See CHAMBERLAIN.

VICE-CHANCELLOR of a univerſity, is an eminent member, choſe annually, to manage affairs in the abſence of the chancellor. See UNIVERSITY.

VICE-DOGE, is a counſellor of Venice, who repreſents the doge when ſick, or abſent; that the ſeignory may never be without a chief.

The *vice-doge* never takes the ducal chair, nor bears the horn, nor is addreſſed under the title of *ſereniſſimo:* yet, the foreign embaſſadors, ſpeaking to the college, uſe the common apoſtrophe of *ſereniſſimo prencipe:* and he performs all the offices of doge; and gives anſwers to embaſſadors, without moving his cap. See DOGE.

VICE-DOMINUS, a vicount, ſheriff, or vidame. See VICOUNT, VIDAME, &c.

VICE-DOMINUS *Abbatiæ*, or *Eccleſiæ*, in the civil and canon law, an advocate, or protector of an abbey, or church. See ADVOCATE, and ADVOWEE.

VICE-DOMINUS *Epiſcopi*, in the canon law, is the commiſſary, or vicar-general of a biſhop. See COMMISSARY, &c.

VICE-GERENT, *Vicegerens*, a vicar, deputy, or lieutenant. See VICAR, LIEUTENANT, &c.

VICE-COMES, in law, &c. } See { VICOUNT.
Accedas ad **VICE-COMITEM**. } See { ACCEDAS.

Reſpectu habendo computi **VICE-COMITIS**. See RESPECTU.

VICE-LEGATE, an officer whom the pope ſends to Avignon, and ſome other cities, to perform the office of a ſpiritual and temporal governor, at a time when there is no legate, or cardinal to command there.

All the Gaule Narbonnoiſe, as Dauphine, Provence, *&c.* has recourſe to the *vice-legate* of Avignon, for all eccleſiaſtical diſpatches; in like manner as the other provinces addreſs themſelves to Rome. See LEGATE.

VICE-ROY, a governor of a kingdom, who commands therein, in the name, and ſtead of a king; with full and ſovereign authority.

Sicily, Catalonia, Mexico, *&c.* are governed by *vice-roys.* See KING.

VICE *Verſa*, a Latin phraſe, frequently retained in Engliſh writings; ſignifying as much as, *on the contrary.*

Thus, as the ſun mounts higher and higher above the horizon, inſenſible perſpiration increaſes; and, *vice verſa*, as he deſcends lower, it diminiſhes.

VICENNALIS, in antiquity, ſomething of 20 years, or that returns after 20 years.

Among the Romans, *vicennalia* was particularly uſed for the funeral feaſts, held on the 20th day after a perſon's deceaſe.

VICENNALIA, or VICENNALES *Ludi*, were alſo games, feaſts, and rejoicings, held every 20th year of the reign of a prince.

On medals, we frequently meet with *vicennalia vota*; the vows put up on that occaſion, for the ſafety of the emperor, and inlargement of the empire.

Theſe are expreſſed by VOT. X & XX, in the medals of Tacitus, Gallienus, and Probus; VOT. X. M. XX, in thoſe of Valerius Maximianus, and Galerius Maximianus; VOT. X. MUL. XX, in thoſe of Conſtantine, Valentinian, and Valens; VOT. X. MULT. XX, in thoſe of Diocleſian, Conſtantine, Julian, Valentinian, Theodoſius, Arcadius, Honorius; VOTIS X. MULT. XX, in thoſe of Julian, Valentinian, Gratian; VOT. X. SIC. XX, in thoſe of Valerius Conſtantius; VOT. XII. FEL. XX, in the younger Licinius; VOT. XV. FEL. XX, in Conſtantine. See VOWS.

VICINAGE, and VICINITUM, a neighbourhood. See VENUE.

Common per Cauſe de VICINAGE. See COMMON.

VICIS *&* *Venellis Mundandis*, a writ lying againſt a mayor, bailiff, *&c.* for not taking care that the ſtreets be well cleanſed.

VICISSITUDE, VICISSITUDO, the ſucceeding of one thing after another.— As, the *viciſſitude* of ſeaſons, fortune, *&c.*

VICOUNTIEL. } See the article { VISCOUNTIEL.
VICONTIELS. } { VISCOUNTIELS.

VICOUNT, VICE-COMES, in our law-books, ſignifies the ſame with *ſheriff*; between which two words, there ſeems to be no other difference, but that the one came from our conquerors, the Normans; the other from our anceſtors, the Saxons. See SHERIFF.

VICOUNT, or VISCOUNT, is alſo uſed for a degree of nobility, next below a count or earl, and above a baron. See NOBILITY.

Camden obſerves, that this is an antient name of office, but a new one of dignity, never heard of among us till Henry VIth's days, who, in his 18th year, created, in parliament, John lord Beaumont, *viſcount Beaumont*: but it is much more antient in other countries.

Du Cange, indeed, will have the dignity to have had its firſt riſe in England; but it is much more probable, it was firſt brought over hither by the Normans.

The privileges of a *vicount*, are, that he may have a cover of aſſay held under his cup when he drinks, and may have a travers in his own houſe.— And a *vicounteſs* may have her gown bore up by a man, out of the preſence of her ſuperiors; and in their preſence by a woman.

VICOUNTIELS, VICONTIELS, VICECOMITALIA, in our law-books, denotes things belonging to the ſheriff; particularly certain farms, for which the ſheriff pays a rent to the king, and makes what profit he can of them. See SHERIFF.

Writs VICOUNTIEL, are ſuch as are triable in the county or ſheriff's-court.— Of which kind are divers writs of nuſance, *&c.* See WRIT, &c.

VICOUNTIEL, or VICONTIEL *Juriſdiction*, is that juriſdiction belonging to the officers of a county; as ſheriffs, coroners, eſcheators, *&c.*

VICTIM, VICTIMA, a bloody ſacrifice offered to ſome deity, of a living thing; either a perſon, or a beaſt, which is ſlain to appeaſe his wrath, or to obtain ſome favour. See SACRIFICE and LUSTRATION.

The Greeks offered Iphigenia, at Aulis, for a *victim* to obtain a favourable wind.— The gods af the heathens had each their proper *victims*: thus, the goat was Bacchus's *victim*; the horſe Neptune's. See GOD, and VICTIMARIUS.

VICTIMARIUS, a miniſter, or ſervant of the prieſt, whoſe office was to bind the *victims*, and prepare the water, knife, cake, and other things, neceſſary for the ſacrifice. See SACRIFICE.

To the *victimarii* it alſo belonged, to knock down, and kill the victims: in order to which, they ſtood cloſe by the altar, naked to the waiſt, but crowned with laurel; and holding a hatchet or a knife up, aſked the prieſt leave to ſtrike; ſaying, *Agone?* ſhall I ſtrike? Whence they were called *agones*, and *cultellarii*, or *cultrarii*.

When the *victim* was killed, they opened it, and after viewing the entrails, took them away, waſhed the carcaſe, ſprinkled the flower on it, *&c.*

The ſame *victimarii* lighted the fire, wherein books were condemned to be burnt. See Liv. 40. lib. 40. c. 29. and A. Gellius, lib. 1. c. 1. extr. 12.

VICTORIAN *Period*, in chronology. See PERIOD.

VICTORY, VICTORIA, the overthrow, or defeat of an enemy, in war, combat, duel, or the like. See WAR, COMBAT, DUEL, CHAMPION, *&c.*

Among the Romans, crowns, triumphs, *&c.* were decreed to their generals, for the *victories* they gained. See CROWN, TRIUMPH, *&c.*

VICTUALLING-*Office*, an office kept on Tower-hill, for the furniſhing his majeſty's navy with *victuals*. See OFFICE. It is managed by ſeven commiſſioners, who have their inferior officers; as ſecretaries, clerks, *&c.* beſides agents in divers parts of Great Britain, Ireland, *&c.* See NAVY.

VICTUS *Ratio*, among phyſicians, a particular manner of living for the preſervation health, and prevention of diſeaſes. See DIET, REGIMEN, &c.

VIDAME*, *Vice-Dominus*, was antiently uſed for the biſhop's deputy in temporals; as *comes*, or *vice-comes*, was the king's. See VICE-DOMINUS, *&c.*

* The word according to Nicod, comes from *vicarius*; according to Paſquier, from *vice-dominus*; *dam* ſignifying *dominus*, or lord. See DOM.

The original inſtitution of *vidamos*, was for defence of the temporalties of biſhopricks, while the biſhops themſelves were taken up in prayers, and other ſpiritual functions.— They alſo led the biſhop's forces, when they were obliged to go to war, either to defend their temporalties, or for the arrier-ban.

They alſo managed, and pleaded their cauſe in courts of juſtice; diſtributed juſtice among their tenants, prevented any body's pillaging, or damaging the houſes of deceaſed biſhops, *&c.*— In effect, they repreſented the biſhop, conſidered as a temporal lord. See BISHOP, OFFENDER, &c. In ſome antient charters, the *vidames* are called *advocates*, *advowees*. See ADVOCATE, and ADVOWEE.

VIDAME is ſtill a title of ſeignory, or lordſhip: attributed to ſeveral gentlemen in France: as, the *vidame* of Chartres, of Amiens, *&c.*

The antient *vidames*, Paſquier ſays, were the biſhops temporal judges; and had the ſame privileges as the vicounts.

By degrees, the *vidames* converted their office into a fee: and the biſhops their *vidames*, or judges, into vaſſals, as kings did their counts, dukes, *&c.* See COUNT, VASSAL, &c.— Accordingly, the *vidame* of Chartres, *&c.* ſtill hold lands of the biſhops of thoſe places.

VIDIMUS, in law, the ſame with *innoteſcimus*; being letters patent of a charter of feoffment, or ſome other inſtrument not of record.

VIDUITATIS *Profeſſio*, the making a ſolemn profeſſion of living a chaſte widow; a cuſtom heretofore obſerved in England, and attended with divers ceremonies. See WIDOW.

VIE. See the article CESTUI *qui vie*.

VIEW*, VISUS, in law, the act of *veiors*, or *viewers*. See VEIOR, and VIEWER.

* This is called, by Bracton, *Res quaſi ſacra quia ſolam perſonam regis reſpicit, & introducta pro pace, & communi utilitate.*

When a real action is brought, and the tenant knows not well what the land is the demandant aſks; he may pray the *view*: which is, that the jury may *ſee* the land which is claimed.

This courſe of proceeding we received from the Normans, as appears by the *Grand cuſtomary*.— It is uſed in various caſes; as in aſſize of rent-ſervice, rent-charge, rent-ſeck; in a writ of nuſance; in a writ quo jure; in the writ de rationabilibus diviſis, *&c.*

VIEW *of Franc-pledge*, VISUS *Franci Plegii*, is the office which the ſheriff in his county-court, or the bailiff in his hundred, performs; in looking to the king's peace, and ſeeing that every man be in ſome pledge. See FRANC-*Pledge*.

VIEW, in matters of optics, perſpective, *&c.* See VISION, SIGHT, PERSPECTIVE, &c.

Point of VIEW. See the article POINT.

VIEW, among hunters, the track, or print of the feet of a fallow deer on the ground. See TRACK, *&c.*

To VIEW *a place*, in the military art, is to ride about it, before the laying of a ſiege, in order to obſerve the ſtrength or weakneſs of its ſituation, and fortification. See RECONNOITRE.

VIEWERS, or VEIORS, in law, are perſons ſent by a court, to *view* a place, or perſon in queſtion; as the ſituation of a place where a fact was committed; or a perſon, in caſe of ſickneſs, *&c.* See VIEW, and VEIOR.

VIGIL, or EVE, in church chronology, the day before any feaſt, *&c.* See FEAST, and EVE.

Though the civil day begin at midnight, yet the eccleſiaſtical, or ſcriptural day, begins at ſix o'clock in the evening, and holds till ſix in the evening the enſuing day. See DAY.

Hence, the collect for every Sunday and holy-day, by order of the church, is to be read, at the preceeding evening-ſervice, at ſix o'clock the day before; from which time the religious day was ſuppoſed to begin.

And this firſt part of the holy-day, from ſix o'clock the day before, was, by the primitive Chriſtians, ſpent in hymns, and other devotions; and being often continued till late in the night, was called *vigil*. See WAKE.

Theſe *vigils* came, by degrees, to be ſo enlarged, that, at laſt, all the day preceeding the holy-day was called by the name.

The origin of *vigils* is deduced by Forbes from a cuſtom in the antient church, for the people, both men and women, to meet together in the evening before Eaſter-day, and watch and pray, as expecting the coming of our Lord, who was to riſe early in the morning. This practice, Tertullian obſerves, *ad Uxorem*, afterwards got to other feaſts and ſaints-days.— But abuſes creeping in, they were forbid by a council, in 1322, and in lieu thereof faſtings were inſtituted on the day before, tho' ſtill called by the antient name of *vigils*.

Coma VIGIL. See the article COMA.

VIGILIA, that ſtate of an animal which is oppoſite to ſleep, and popularly called *waking*, or *watching*. See SLEEP, and WATCHING.

VIGINTIVIRATE, a dignity among the ancient Romans, eſtabliſhed by Cæſar.

This dignity comprehended four others; for of the *vigintiviri*, or twenty men which compoſed the company, there were three who ſat and judged of all criminal affairs; three others had the inſpection of the coins, and coinage; four took care of the ſtreets of Rome; and the reſt were judges of civil affairs.

VILL, VILLA. See the article VILLAGE.

VILLA *Regis*, or *Regia*, a title antiently given to thoſe *villages* where the kings of England had a royal ſeat, and held the manor in their own demeſn: having there commonly a free chapel exempt from the biſhop's juriſdiction.

VILLÆ *Præpoſitus*. See the article PRÆPOSITUS.

VILLAGE*, VILLA, or VILL, an aſſemblage of houſes, inhabited chiefly by peaſants and farmers, having uſually a church, but no market.

* The word is French, formed of *vil*, or *vilis*, low, mean, contemptible: or rather, from the Latin, *villa*, a country houſe, or farm.

The want of a market diſtinguiſhes a *village* from a *town*, as the church does from a *green*, *ſtreet*, &c. See TOWN, &c.

Among our Saxon anceſtors, *vill*, or *village*, was uſed in the ſenſe of the Roman *villa*; *viz.* for a country farm, or ſeat, furniſhed with convenient out-houſes, &c. for repoſiting the fruits thereof. Afterwards it came to be taken for a manor: then for part of a pariſh, or the pariſh itſelf. See PARISH.

Hence, in ſeveral antient law-books, *vill* and *pariſh* are the ſame thing: accordingly, Forteſcue, *de Laudibus Leg. Ang.* writes, "That the boundaries of *villages* are not by houſes, "ſtreets, or walls; but by a large circuit of ground, within "which may be divers hamlets, waters, woods, &c.

Fleta makes this difference between a *manſion*, a *village*, and a *manor*; that a manſion may conſiſt of one, or more houſes; though there is only to be one dwelling-place, without any other very near it: for if other houſes be contiguous, it is then a *village*.— A manor may conſiſt of one or more *villages*. See MANSION, and MANOR.

For the better government of *villages*, the lord of the ſoil has uſually a power to hold a court-baron every three weeks. See COURT-*Baron*.

VILLAIN, VILLANUS, in our antient cuſtoms, the ſame with *bond-man*: called alſo, in Domeſday-book, *ſervus*, ſlave. See SERVANT, SLAVE, &c.

A *villain* was one who held lands in *villenage*, or on condition of rendering baſe ſervices to his lord. See SERVICE, VASSAL, &c.

There were antiently in England two ſorts of *villains*, viz. *villains in groſs*, who were bound immediately to the perſons of the lords, and to their heirs.— and *villains regardant* to a manor, by the civilians called *glebæ adſcripti*; who were bound to their lord, as members belonging to ſuch a manor, of which he was owner. See REGARDANT.

This latter was a *pure villain*, of whom the lord took redemption to marry his daughter, and to make him free; and he might put him out of his lands and tenements at his will; might beat and chaſtiſe him, but not maim him.

They were called *villains* from *villa*; becauſe they dwelt in *villages*: the ſame were alſo called *pagenſes*, and *ruſtici*; and of ſuch ſervile condition were they, that they were uſually ſold with the farm to which they reſpectively belonged. See PAGAN.

There are not properly ary ſuch *villains* now, though the law concerning them ſtands unrepealed.— The lands before held in *villenage*, are now held in free and common *ſocage*. See TENURE, SOCAGE, &c.

VILLAIN *Eſtate*, or *condition*, is contradiſtinguiſhed to *free eſtate*. See BASE *Eſtate*, and VILLENAGE.

VILLAINAGE. See the article VILLENAGE.

VILLAINOUS *Judgment*, is that which caſts the reproach and ſtain of *villany* and ſhame on him againſt whom it is given.— As that againſt a conſpirator, &c. See JUDGMENT, and INFAMOUS.

Lambard calls it *villainous puniſhment*; and ſays, it may well be called *villainous*, in regard the judgment, in ſuch caſe, ſhall be like the antient judgment in attaints, *viz.* that the criminals ſhall not be of any credit afterwards; nor ſhall it be lawful for them, in perſon, to approach the king's court: that their lands and goods ſhall be ſeized into the king's hands, their trees rooted up, their bodies impriſoned, &c.

VILLARUM *Nomina*. See the article NOMINA.

VILLENAGE, or VILLAINAGE, VILLANIA, the quality or condition of a *villain*. See VILLAIN.

Villenage is more particularly uſed for a ſervile kind of tenure of lands, or tenements; whereby the tenant was bound to do all ſuch ſervice as the lord commanded, or were fit for a *villain* to perform: which Bracton expreſſes, by *Sciri non poterit veſperare, quale ſervitium fieri debet manè*. See VILLAIN, and SERVICE.

Villenage is divided into that *by blood*, and that *by tenure*.— Tenure, in *villenage*, could make no freeman a villain, unleſs it were continued time out of mind; nor could free land make a *villain* free. See TENURE.

Villenage is alſo divided by Bracton into *pure villenage*, where the ſervices to be performed were indeterminate and arbitrary, as above expreſſed— and *ſocage villenage*, which was to carry the lord's dung into his fields, to plough his ground on certain days, ſow and reap his corn, &c. and even to empty his jakes: as the inhabitants of Bicton were bound to do to the lord of Clun-caſtle in Shropſhire; which was afterwards turned into a rent, now called *Bickton ſilver*; and the *villainous* ſervice excuſed.

VILLI, *coarſe hair*, in anatomy, is uſed in the ſame ſenſe as *fibres*, or *fibrillæ*. See FIBRE.

VILLI, in botany, denotes a ſort of tomentum, or down, like the grain or ſhag of pluſh; with which, as a kind of excreſcence, ſome trees do abound. See TOMENTUM.

VILLOUS, VILLOSA, is particularly applied to one of the coats or membranes of the ſtomach, called *cruſta villoſa*.— See *Tab. Anat.* (*Splanch.*) *fig.* 2. *lit. b.* ſee alſo STOMACH, &c.

It takes its name from innumerable *villi*, or fine fibrillæ, wherewith its inner ſurface is covered. See CRUSTA *Villoſa*.

VINALIA, in antiquity, a name common to two feaſts among the antient Romans; the one in honour of Jupiter, and the other of Venus. See FEAST.

The firſt was held on the nineteenth of Auguſt, and the ſecond on the firſt of May.— The *vinalia* of the nineteenth of Auguſt, were called *vinalia ruſtica*, and were inſtituted on occaſion of the war of the Latins againſt Mezentius; in the courſe of which war, that people vowed a libation to Jupiter of all the wine of the ſucceeding vintage.

On the ſame day likewiſe fell the dedication of a temple of Venus; whence ſome authors have fallen into a miſtake, that theſe *vinalia* were ſacred to Venus.— But Varro, LLL. V. and Feſtus, in *Verbo Ruſtica*, diſtinguiſh between the two ceremonies; and expreſly aſſert the *vinalia* to be a feaſt of Jupiter.

VINCULUM, in algebra, a character in form of a line, or ſtroke drawn over a factor, diviſor, or dividend, when compounded of ſeveral letters, or quantities, to connect them, and ſhew that they are to be multiplied, or divided, &c. together, by the other term. See CHARACTER, MULTIPLICATION, DIVISION, &c.

Thus, $d \times \overline{a + b - c}$, ſhews that d is to be multiplied into $a + b - c$.

VINDEMIATING*, the gathering of the grapes, or other ripe fruits; as apples, pears, cherries, &c.

* The word is formed of the Latin, *vindemia*, vintage. See VINTAGE.

VINDEMIATRIX, or VINDEMIATOR, a fixed ſtar of the third magnitude, in the northern wing of the conſtellation Virgo; whoſe longitude, latitude, &c. ſee among the reſt of thoſe of VIRGO.

VINDICATION, *Claiming*, in the civil law, an action ariſing from the property a perſon has in any thing: or a permiſſion to take or ſeize a thing, as one's own, out of the hands of a perſon, whom the law has doomed not to be the true proprietor.

VINE, VITIS, a noble plant, or ſhrub, of the reptile kind; famous for its fruit, or grapes, and for the liquor they afford. See WINE.

The kinds of *vines* are almoſt infinite; denominated either from the ſoil, and place where they grow; as the *Bourguignon*, *Bourdelas*, *Italian*, *Mantua vine*, &c. or from the form, colour, taſte, &c. of their grapes; as the *acorn*, *apricot*, *damaſk*, *birds-bill*, *muſcadine*, &c. *vine*.

Our gardeners find, that *vines* are capable of being cultivated in England, ſo as to produce large quantities of grapes; and thoſe ripened to ſuch a degree, as may afford a good ſubſtantial vinous juice— Witneſs the vineyards in Somerſetſhire; particularly that famous one at Bath.

In effect, it does not ſeem ſo much owing to the inclemency of our Engliſh air, that our grapes are generally inferior to thoſe of France, as to the want of a juſt culture.

Thoſe fitted for the Engliſh climate, Mr. Mortimer finds to be the ſmall black grape, the white muſcadine, parſley grape, muſcadilla, white and red Frontigniac.— Mr. Bradley recommends the July grape, the early ſweet water grape, lately brought from the Canaries; the arbois, or French ſweet water grape: all which, if well managed, and the weather favourable, are ripe by the middle of Auguſt.— He alſo recommends the claret and Burgundy grapes.

The beſt ſoil for *vines*, according to Mortimer, is the hotteſt gravel, ſand, or dry rocky ground; provided it be well watered and ſhaded.— At firſt planting, Mr. Bradley recommends chalky hills, as proper for *vines*.

To mend a ſoil that wants thoſe qualities, it is good to throw in the rubbiſh of old buildings, well mixed with twice as much earth, and ſifted about the roots of the *vines*. See VINEYARD.

Vines are propagated either by layers, or cuttings; that is, either by laying down the young branches as ſoon as the fruit is gathered, or by making plantations of ſlips, or cuttings, at that time. See PROPAGATION.

Mr. Mortimer ſays, it may be done any time in the winter before January; though Bradley ſays, he has done it, with ſucceſs, in March and April.

For the Pruning of VINES. } See the article { PRUNING.
For the Planting of VINES. } { VINEYARD.

VINEA, or fortification. MANTELET.

VINEGAR*, *Acetum*, an agreeable, acid, penetrating liquor, prepared from wine, cyder, beer, and other liquors; of conſiderable uſe, both as a medicine, and a ſauce. See ACETUM.

* The word is French, *vinaigre*; formed from *vin*, wine; and *aigre*, ſour. See WINE.

Wine, and other vinous liquors are ſaid to gain a grateful ſharpneſs, *i. e.* to become *vinegar*, by having their ſalts exalted by inſolation, or other means; and their ſulphurs weakned and depreſſed.

Others aſcribe the converſion of vinous liquors into *vinegar*, to the grinding or ſharpening of the longitudinal particles thereof; by which means, they become more ſharp and pungent.

The method of making *vinegar* has long been kept a ſecret among the people of that profeſſion; who, it is ſaid, oblige themſelves to each other by oath not to reveal it: but, notwithſtanding this, the *Philoſophical Tranſactions*, and ſome other late writings, furniſh us with approved accounts thereof.

Method of making Cider VINEGAR.— The cider (the meaneſt of which will ſerve the purpoſe) is firſt to be drawn off fine into another veſſel, and a quantity of the muſt, or pouz of apples to be added: the whole is ſet in the ſun, if there be a conveniency for the purpoſe; and, at a week or nine days end, it may be drawn off. See CIDER.

Method of making Beer VINEGAR.— Take a middling ſort of beer, indifferently well hopped; into which, when it has worked well, and is grown fine, put ſome rape, or huſks of grapes, uſually brought home for that purpoſe: maſh them together in a tub; then, letting the rape ſettle, draw off the liquid part, put it into a caſk, and ſet it in the ſun as hot as may be; the bung being only covered with a tile, or ſlateſtone: and in about thirty or forty days, it will become a good *vinegar*, and may paſs in uſe as well as that made of wine, if it be refined, and kept from turning muſty.

Or thus:— To every gallon of ſpring water, add three pounds of Malaga raiſins; which put into an earthen jar, and place them where they may have the hotteſt ſun from May till Michaelmas: then preſſing all well, tun the liquor up in a very ſtrong iron-hooped veſſel, to prevent its burſting: it will appear very thick and muddy, when newly preſſed; but will refine in the veſſel, and be as clear as wine.— Thus let it remain untouched for three months, before it be drawn off, and it will prove excellent *vinegar*.

To make Wine VINEGAR.— Any ſort of vinous liquor, being mixed with its own fæces, flowers, or ferment, and its tartar firſt reduced to powder; or elſe with the acid and auſtere ſtalks of the vegetable from whence the wine was obtained, which hold a large proportion of tartar: and the whole being kept frequently ſtirring in a veſſel which has formerly held *vinegar*, or ſet in a warm place full of the ſteams of the ſame, will begin to ferment a-new, conceive heat, grow ſour by degrees, and ſoon after turn into *vinegar*.

The remote ſubjects of acetous fermentation, are the ſame with thoſe of vinous; but the immediate ſubjects of it, are all kinds of vegetable juices, after they have once undergone that fermentation which reduces them to wine: for it is abſolutely impoſſible to make *vinegar* of muſt, the crude juice of grapes, or other ripe fruits, without the previous aſſiſtance of vinous fermentation.

The proper ferments for this operation, whereby *vinegar* is prepared, are— 1°. The fæces of all acid wines.— 2°. The lees of *vinegar*.— 3°. Pulverized tartar; eſpecially that of rheniſh wine, or the cream or cryſtals thereof.— 4°. *Vinegar* itſelf.— 5°. A wooden veſſel, well drenched with *vinegar*, or one that has long been employed to contain it.— 6°. Wine that has often been mixed with his own fæces.— 7°. The twigs of vines, and the ſtalks of grapes, currants, cherries, or other vegetables of an acid auſtere taſte.— 8°. Bakers leaven, after it is turned acid.— 9° All manner of ferments, compounded of thoſe already mentioned.

Vinegar is no production of nature, but a creature of art: for verjuice, the juices of citrons, lemons, and the like native acids, are improperly ſaid to be *natural vinegars*; becauſe, when diſtill'd, they afford nothing but vappid water: whereas it is not the property of *vinegar* to yield an acid ſpirit by diſtillation.

Method of making VINEGAR *in France*.— The French uſe a method of making *vinegar* different from that above deſcribed. — They take two very large oaken veſſels, the larger the better, open at the top; in each whereof they place a wooden grate, within a foot of the bottom: upon theſe grates, they firſt lay twigs, or cuttings of vines, and afterwards the ſtalks of the branches, without the grapes themſelves, or their ſtones; till the whole pile reaches within a foot of the brim of the veſſels: then they fill one of theſe veſſels with wine to the very top, and half fill the other; and with liquor drawn out of the full veſſel, fill up that which was only half full before; daily repeating the ſame operation, and pouring the liquor back from one veſſel to the other; ſo that each of them is full, and half full by turns.

When this proceſs has been continued for two or three days, a degree of heat will ariſe in the veſſel, which is then but half full, and increaſe for ſeveral days ſucceſſively, without any appearance of the like in the veſſel which happens to be full during thoſe days; the liquor whereof will ſtill remain cool: and as ſoon as the heat ceaſes in the veſſel that is half full, the *vinegar* is prepared: which, in the ſummer, happens on the fourteenth or fifteenth day from the beginning; but in the winter, the fermentation proceeds much ſlower: ſo that they are obliged to forward it by artificial warmth, or the uſe of ſtoves.

When the weather is exceeding hot, the liquor ought to be poured off from the full veſſel into the other twice aday: otherwiſe, the liquor would be over-heated, and the fermentation prove too ſtrong; whence the ſpirituous parts would fly away, and leave a vappid wine, inſtead of *vinegar*, behind.

The full veſſel is always to be left open at the top, but the mouth of the other muſt be cloſed with a cover of wood; in order the better to keep down and fix the ſpirit in the body of the liquor; for otherwiſe, it might eaſily fly off in the heat of fermentation.— The veſſel that is only half full ſeems to grow hot, rather than the other, becauſe it contains a much greater quantity of the vine-twigs and ſtalks, than that, in proportion to the liquor; above which the pile riſing to a conſiderable heighth, conceives heat the more, and ſo conveys it to the wine below.

VINEGAR *of Antimony*, is an acid ſpirit, drawn by diſtillation from the marcaſite of antimony. See ANTIMONY.

Its uſe is commended in continued and malignant feavers.

The apothecaries have, likewiſe, a kind of theriacal *vinegar*, acetum theriacale, made of Venice treacle digeſted in wine *vinegar*. See ACETUM.

VINEYARD, VINETUM, a plantation of vines. See VINE.

The beſt ſituation of a *vineyard*, is on the declivity of an hill lying to the ſouth. See EXPOSURE.

The vine is propagated by ſlips, layers, or ſuckers, planted in a nurſery, and thence tranſplanted, about February, into the *vineyard*.

As to the ſoil, it is agreed, nothing can be too dry for them: and as to the ſorts of vines, none but the forward ones ought to be planted in England.— Theſe are found to ripen very well in open borders, without walls.

They are to be planted in lines running north and ſouth, five or ſix foot apart; only two vines in each hole.— The September following, the ſhoots of that ſummer to be pruned ſhorter, according to their ſtrength; and the ſummer following, the ſtrongeſt will begin to ſhew a little fruit.— They are now to be ſupported with ſtakes, *&c.* ſo as they may run above a foot above ground: the higher they run, the leſs danger they are in of being ſpoiled with wet; but the lower, the ſweeter grapes, and the ſtronger wine.

If, notwithſtanding due pruning, they do not ſeem inclinable to bear large bunches, the ground to be helped with a mixture of rubbiſh of ſome old building, with ſea-coal aſhes, or drift ſand.— Thus managed, a *vineyard*, in five or ſix years, will produce good ſtore of grapes.

The celebrated *vineyard* at Bath, containing about ſix acres of ground, planted with white muſcadine, and black cluſter grapes, Mr. Bradley aſſures us, by ſuch management, ſome years ago, yielded ſixty hogſheads of wine at a vintage: though in the year 1721, it only yielded three hogſheads.

The ſame author mentions a little *vineyard* of a private perſon at Rotherhith; which, though only conſiſting of 100 vines, and ſome of them only of the ſecond year's growth, yielded, at a vintage, 95 gallons of wine; which, he adds, had the true Burgundy flavour, as being made from that ſort of grape: and exceeded any made from any *vineyard* on this ſide Paris. See WINE.

VINOUS, VINOSUS, ſomething that relates to wine; or that has the taſte, and ſmell thereof. See WINE.

All vegetables, by a due treatment, afford a *vinous* liquor; as corn, pulſe, nuts, apples, grapes, *&c.* See MALT, BREWING, *&c.*

A ſecond fermentation, duly managed, turns any *vinous* liquor into an acetous one. See VINEGAR.

The proper character, and effect of fermentation, is to produce either a *vinous*, or an acetous quality in the body fermented. See FERMENTATION.

Some of our countrymen, bound on a voyage to the Eaſt Indies, having filled ſeveral caſks with Thames-water, to carry along with them; obſerved an inteſtine motion in it, when they came to the equator; and found it afterwards turned into a kind of *vinous* liquor, capable of affording an inflammable ſpirit by diſtillation. See WATER, and SPIRIT. This, without diſpute, proceeded from the flowers, leaves, roots, fruits, and other vegetable matters, continually falling, or waſhed down in that river.— Such waters were always found in a ſtate of putrefaction, ere they put on a *vinous* nature. See PUTREFACTION.

VINTAGE, the crop of wine, or what is got from the vines each ſeaſon. See WINE.

The word is alſo uſed for the time or ſeaſon of gathering, or preſſing the grapes.

In France, a decree or ordinance of the proper judge, and a ſolemn publication thereof, are required, ere the *vintage* can be begun.

VINUM, a liquor, or drink, popularly called *wine*. See WINE.

VINUM, in medicine, VINUM *Medicatum*, is particularly applied to ſeveral medicated wines, *i. e.* medicinal preparations, whereof wine is the baſis; ſuch as the

VINUM *Abſynthites*, or worm-wood wine; made of the great or little *abſynthium*, by taking the apices, or tops of the flowers, putting them in a ſacculus, or bag, and ſuſpending it in the middle of a veſſel of wine; which fermenting, extracts the taſte, ſmell, and virtues of the worm-wood. See ABSYNTHIUM.

VINUM *Aromaticum*, made by infuſing aromatics, or ſpices, in new wine, or muſt.

VINUM *Cydonites*, quince-wine, made of the ſlices of that fruit, ſteeped in muſt, or new wine.

VINUM *Emeticum*, emetic wine; is wine wherein the glaſs, or regulus of antimony, or crocus metallorum, have been ſteeped. See EMETIC.

It only takes a certain degree of efficacy from the matters; nor is it found any ſtronger at three months end, than at the end of eight days.— It purges both upwards, and downwards.

VINUM *Hippocraticum*, or *hippocras*; ſo called of *manica Hippocratis*, or Hippocrates's ſleeve, through which it is ſtrained; is a ſort of ſpiced wine, in which ſugar and ſpices have been ſteeped for ſome time. See HIPPOCRAS, CLARET, &c.

VINUM *Marinum*, ſea-wine; made by caſting ſea-water on the grapes in the vat.

VINUM *Picatum*, pitched wine; made of pitch infuſed in muſt.

VINUM *Roſatum*, roſe-wine; made by ſteeping roſes for three months in wine.

VINUM, called alſo *acetum*, *ſcilliticum*. See SCILLA.

VINUM *Strobilites*, or pine-apple wine: — *Vinum hyſſopites*, hyſſop-wine.

VIOL, VIOLA, a muſical inſtrument, of the ſame form with the *violin*; and ſtruck, like that, with a bow. See VIOLIN.

There are *viols* of divers kinds — The firſt, and principal, among us, is the *baſs-viol*, called, by the Italians, *viola di gamba*, or the *leg-viol*; becauſe held between the legs. It is the largeſt of all; and is mounted with ſix ſtrings. Its neck is divided in half notes, by ſeven frets fixed thereon. Its ſound is very deep, ſoft, and agreeable.— The tablature, or muſic for the *baſs-viol*, is laid down on ſix lines, or rules.

What the Italians call *alto viola*, is the counter-tenor of this; and their *tenore viola*, the tenor. They ſometimes call it, ſimply, the *viol*: ſome authors will have it the *lyra*, others the *cithara*, others the *chelys*, and others the *teſtudo* of the antients. See LYRA, &c.

2°. The *love-viol*, *viola d' amore*, which is a kind of triple *viol*, or violin; having ſix braſs or ſteel ſtrings, like thoſe of the harpſicord.— It yields a kind of ſilver ſound, which has ſomething in it very agreeable.

3°. A *large viol*, with 44 ſtrings, called, by the Italians, *viola di bardone*; but little known among us.

4°. *Viola baſtarda*, or *baſtard viol*, of the Italians; not uſed among us: Broſſard takes it to be a kind of *baſs-viol*, mounted with 6 or 7 ſtrings, and tuned as the common one.

5°. What the Italians call *viola di braccio* arm-*viol*; or, ſimply, *braccio*, *arm*; is an inſtrument anſwering to our counter-tenor, treble, and fifth violin.

6°. Their *viola prima*, or *firſt viol*, is really our countertenor violin; at leaſt, they commonly uſe the cliff of *c ſol ut* on the firſt line, to denote the piece intended for this inſtrument.

7°. *Viola ſecunda*, is much the ſame with our tenor violin; having the cliff of *c ſol ut* on the ſecond line.

8°. *Viola terza*, is nearly our fifth violin; the cliff *c ſol ut* on the third line.

9°. *Viola quarta*, or fourth *viol*, is not known in England, or France: though we frequently find it mentioned in the Italian compoſitions, the cliff on the fourth line.

Laſtly, their *violetta*, or little *viol*; is, in reality, our triple *viol*: though ſtrangers frequently confound the term, with what we have ſaid of the *viola prima*, *ſecunda*, *terza*, &c.

VIOL, is alſo a term uſed among mariners, when a hawſer, or ſtrand-rope is bound faſt with nippers to the cable, and brought to the jeer-capſtan, for the better weighing of the anchor, where the main capſtan proves inſufficient. See ANCHOR, CABLE, CAPSTAN, &c.

VIOLATION, the act of *violating*, i.e. forcing a woman, or committing a rape upon her. See RAPE.

Amnon, David's ſon, *violated* his ſiſter, who was avenged by Abſalom: Tereus *violated* his ſiſter-in-law Philomela.— To *violate* the queen, the king's eldeſt daughter, or the princeſs of Wales, is high treaſon. See TRRASON.

VIOLATION, is alſo uſed, in a moral ſenſe, for a breach, or infringment of a law, ordinance, or the like. See TRANSGRESSION.

Thus, we ſay, a *violation* of the law of nature, of a treaty of peace, of one's oath, *&c.*— The law of nations was *violated* in the inſult offered to Mr. S——— the king's embaſſador at Madrid.

VIOLATION, is alſo uſed for a profanation.— In which ſenſes, we ſay to *violate* a church, *&c.* See PROFANATION.

VIOLENT, in the ſchools, a thing done by force.—In which ſenſe it ſtands oppoſed to *ſpontaneous*. See SPONTANEOUS.

A thing is ſaid to be *violent*, when effected by ſome external principle; the body that undergoes it contributing nothing thereto, but ſtruggling againſt it.

The body, in ſuch caſe, is ſaid to *ſtruggle*, by reaſon whatever is *violent*, diſcompoſes and diſtracts a thing from its natural conſtitution, and tends to deſtroy it.

The ſchoolmen all allow, that man, as being endued with reaſon, is capable of ſuffering ſuch *violence*; but brute and inanimate bodies are not: *in brutum*, &c. violentum *non cadit*.

VIOLENT *Motion*. See the article MOTION.

VIOLIN, VIOLINO, *Fiddle*, a muſical inſtrument, mounted with four ſtrings, or guts; and ſtruck, or played with a bow.

The *violin* conſiſts, like moſt other inſtruments, of three parts; the *neck*, the *table*, and the *ſoundboard*.

At the ſides are two apertures, and ſometimes a third towards the top, ſhaped like a heart.

Its bridge, which is below the apertures, bears up the ſtrings, which are faſtened to the two extremes of the inſtrument; at one of them, by a ſcrew, which ſtretches, or looſens them at pleaſure.

The ſtyle and ſound of the *violin*, is the gayeſt and moſt ſprightly of all other inſtruments; and hence it is, of all other, the fitteſt for dancing. Yet there are ways of touching it, which render it grave, ſoft, languiſhing, and fit for church, or chamber muſic.

It generally makes the treble, or higheſt parts in conſorts.— Its harmony is from fifth to fifth. Its play is compoſed of baſs, counter-tenor, tenor, and treble; to which may be added, a fifth part: each part has four fifths, which riſe to a greater ſeventeenth.

In compoſitions of muſic, *violin* is expreſſed by V: two VV denote two *violins*.

The word *violin* alone, ſtands for *treble violin*: when the Italians prefix *alto*, *tenore*, or *baſſo*, it then expreſſes the counter-tenor, tenor, or baſs-*violin*.

In compoſitions, where there are two, three, or more different *violins*, they make uſe of *primo*, *ſecundo*, *terzo*, or of the characters I° II° III°, or 1° 2° 3°, *&c.* to denote the difference.

The *violin* has only four ſtrings, each of a different thickneſs, the ſmalleſt whereof makes the *e ſi mi* of the higheſt octave of the organ; the ſecond, a fifth below the firſt, makes the *a mi la*; the third, a fifth below the ſecond, is *d la re*; laſtly, the fourth, a fifth below the third, is *g e re ſol*.

Moſt nations, ordinarily, uſe the cliff *g re ſol* on the ſecond line, to denote the muſic for the *violin*; only in France, they uſe the ſame cliff as the firſt line at bottom: the firſt method is beſt, where the ſong goes very low, the ſecond, where it goes very high.

The VIOLONCELLO of the Italians, is properly our fifth *violin*, which is a little baſs *violin*, half the ſize of the common baſs *violin*, and its ſtrings juſt half as thick, and half as long; which renders the ſound juſt an octave lower than the ſame.

Their VIOLONE is a double baſs, almoſt twice as big as the common baſs *violin*, and the ſtrings bigger and longer, in proportion; and conſequently, its ſound an octave lower than that of our baſs *violin*: which has a noble effect in great concerto's. See VIOL.

VIPER, VIPERA, in natural hiſtory, a kind of ſerpent, famed not only for the exceeding venomouſneſs of its bite, which is one of the moſt dangerous poiſons in the animal kingdom, but alſo for the great uſefulneſs of its fleſh in medicine: whence vipers come to make a conſiderable article in divers arts. See POISON.

This remarkable reptile, has the biggeſt and flatteſt head of all the ſerpent-kind. Its uſual length is about half an ell; and its thickneſs an inch: its ſnout is not unlike that of a hog. It has ſixteen ſmall immoveable teeth in each jaw; beſides, two other large, ſharp, hooked, hollow, tranſparent, canine teeth, ſituate at each ſide of the upper jaw, which are thoſe that do the miſchief: theſe are flexible in their articulation; and are ordinarily laid flat along the jaw, the animal never raiſing them but when it would bite.

The roots or baſes of theſe teeth, or fangs, are incompaſſed with a veſicle, or bladder, containing the quantity of a large drop of a yellow inſipid ſalivous juice.

It has only one row of teeth; whereas all other ſerpents have two: its body is not at all fetid; whereas the inner parts of the bodies of other ſerpents are intolerable.— It creeps very ſlowly, and never leaps like other ſerpents; though it is nimble enough to bite, when provoked.

Its body is of two colours, aſh-coloured, or yellow, and the ground ſpeckled with longiſh brown ſpots. — The ſcales under its belly, are of the colour of well poliſhed ſteel.

The male has two ſets of genital inſtruments, and the female two matrixes, *&c.* She brings forth her young living; whereas other ſerpents lay eggs, and hatch them: on which account, the *viper* is ranked among the viviparous animals. See VIVIPAROUS.

Her young ones come forth wrapped up in thin ſkins, which break on the third day, and ſet the animal at liberty.— She brings forth to the number of 20 young; but only one each day. The antients, particularly Pliny, Galen, *&c.* believed that the young killed their mother in the delivery; but this is not the only miſtake they were guilty of on the ſubject of the *viper.*— They held, that it eat cantharides, ſcorpions, *&c.* which rendered its poiſon ſo very dangerous.

Dr. Mead obſerves, that the antients eſteemed the *viper* ſacred; and that the kings of the Eaſt Indies cauſed cottages to be built for their entertainment, and their killers to be puniſhed with death.— On medals, the *viper* is frequently repreſented as a ſymbol of divine power; and as ſuch, given by way of attribute to the antient phyſicians.

As to the manner wherein the *viper* conveys its poiſon, authors are a little diſagreed.— Franciſco Redi, and Moiſe Charras, have each of them wrote very curious pieces on the ſubject, but their reſult is very different.

Redi maintains, that all the venom of the *viper*, is contained in the two veſiculæ, or bags, which cover the baſe of the two canine teeth; whence, upon biting, the yellowiſh liquor is ſqueezed out into the wound: where, mixing with the blood, and other juices, it produces thoſe dreadful ſymptoms.

This hypotheſis he maintains, by a good number of experiments; as of animals, *viz.* cocks, *&c.* being bit with *vipers*, after theſe veſiculæ and their juice had been taken out; without any ſigns of poiſon, or any ill conſequence at all.

Charras, on the other hand, maintains, that this yellow liquor is not poiſonous; that he has given it to pigeons, as food, without their being at all diſordered thereby; that the *viper*'s bite he has always found mortal to animals, even after the bag has been taken clear out, as well as before: and laſtly, that the poiſon muſt lie in the irritated ſpirits of the *viper*, which it exhales in the ardor of its biting; and which are ſo cold, that they curdle the blood, and ſtop the circulation.

The controverſy between theſe two ingenious authors, is very extraordinary: their ſyſtems are oppoſite; yet both maintained by a great number of well atteſted experiments. —The public, however, generally give into the ſentiment of Sig. Redi; as anſwering beſt to the mechaniſm of the parts.

Dr. Mead ſuppoſes it the true one, in his eſſay on the poiſon of the *viper*; and adds to Redi's account, that the poiſon in the *viper*'s bag is ſeparated from the blood, by a conglomerate gland, lying in the lateral anterior part of the os ſincipitis, behind the orbit of the eye; from which gland is a duct, that conveys the poiſon to the bags at the teeth. — The teeth, he adds, are tubulated for the conveyance and emiſſion of the poiſon into the wound; but their hollowneſs does not reach to the apex, or tip of the tooth, but ends in a long ſlit below the point, out of which the poiſon is emitted.

Theſe ſlits, or perforations of the teeth, Galen ſays, the mountebanks, of his days, uſed to ſtop with ſome kind of paſte; after which, they would publickly expoſe themſelves to be bitten, without danger.

Effects of the bite of the VIPER— The ſymptoms following the bite of a *viper*, are an acute pain in the place wounded; ſwelling, firſt red, afterwards livid, ſpreading by degrees; great faintneſs; a quick, low, and ſometimes interrupted pulſe; ſickneſs at the ſtomach; bilious convulſive vomiting; cold ſweats; ſometimes pains about the navel; and death itſelf, if the ſtrength of the patient, or ſlightneſs of the bite, do not overcome it.

If he do overcome it, the ſwelling continues inflamed for ſome time; and the ſymptons abating, from the wound runs a ſanious liquor, little puſtules are raiſed about it, and the colour of the ſkin is as if the patient were icterical.

By the microſcope, the virus has been found to conſiſt of minute ſalts in continual motion; after which a number of ſpicula, or darts appeared, reſembling, but much finer, a ſpider's web.— This, when mixed with ſyr. violar. inclined to red, no ways to green; ſo that the juice is not alkalious: But Mr. Boyle, and Dr. Pitcairn, prove the blood to be only an alkaly.

Such a ſmall quantity of the virus, ſeems to have ſo great an effect by wounding the fibres, and altering the coheſion of the globules of blood, which, by the elaſtic matter thereof proves a nimble vehicle, to carry the viperine ſpicula almoſt every where ſuddenly.— Theſe will ſtimulate and fret the ſenſible membranes; whereupon, a more than uſual afflux of the animal juices may be carried to the parts.

The cure ſeems very unſettled: Mr. Boyle found a hot iron held near the place ſucceſsful; but it proved otherwiſe with M. Charras. — Again, the ſnake-ſtone from the Eaſt Indies, immediately applied to the place, is much commended: but ſignior Redi, and M. Charras, found it of no uſe; yet Baglivi, and Dr. Havers, give inſtances of its good ſucceſs.

Dr. Mead adds, that the ſame ſtone directly applied to a pigeon, when bitten, ſaved its life four hours; whereas, moſt of the other pigeons bitten died in half an hour.

This ſtone is not natural, but factitious; its virtue lies in its poroſity, which is ſuppoſed to imbibe the virus.

The *viper*-catchers, Dr. Mead adds, have a ſpecific, in which they can ſo far confide, as not to be afraid of being bitten. — That ſpecific is, the axungia of the *viper* preſently rubbed into the wound; which conſiſting of clammy, viſcid, penetrating, and active parts, ſheaths the ſalts of the virus.

The ſame author, applying it to the noſtrils of a dog bitten, found it well the next day: when this is not timely applied, and the virus has inſinuated into the blood, the *ſal viper.* is excellent, given and repeated till ſweats be produced.— This ſucceeded well with M. Charras; and Dr. Mead relates, that it recovered one, after the virus had induced an univerſal icterus.

Vipers make a conſiderable article in medicine.—Moſt authors agree, that there is no part, humour, or excrement, not even the gall itſelf, of a *viper*, but may be ſwallowed without much harm.— Accordingly, the antients, and, as ſeveral authors aſſure us, the Indians at this day, both of the eaſt and weſt, eat them as we do eels.

Caro viperina, *viper*'s fleſh, either roaſted, or boiled, the phyſicians unanimouſly preſcribe as an excellent reſtorative; particularly in the elephantiaſis, incurable conſumptions, leproſy, *&c.* and Dr. Mead thinks, they might be leſs ſparing in the quantity than they are; inſtead of a little *viper*'s fleſh, he recommends the broth, or gelly of *vipers*; or, as the antients did, to boil and eat them as fiſh, or at leaſt, to drink vinum viperinum, *i. e.* wine wherein they have been long infuſed.

Viper's fleſh is an ingredient in ſeveral of our beſt antidotes; as the theriaca andromach. *&c.* See THERIACA.

The apothecaries alſo ſell the pulvis viperinus, which is only dried *vipers* pulverized, heart, liver, and all, and paſſed through a ſieve.— This, to heighten the price we ſuppoſe, they call *animal bezoard*. See BEZOARD.

The *ſalts of vipers*, whether volatile, or fixed, alſo their fat, or axungia, and their oil, chymically drawn, are drugs in good repute.

VIPER-*Wine*. See the article WINE.

VIRAGO*, a woman of extraordinary ſtature; and who, with the female ſex, has the mien and air of a man, and performs the actions and exerciſes of men. See AMAZON.

* The word is pure Latin, formed from *vir* man; and ſeldom uſed, but in the way of diverſion.

Such were Semiramis, and Pentheſilea, among the antients, and Jeanne la Pucelle, commonly called *the maid of Orleans*, among the moderns.

In the vulgate verſion of the Bible, Eve is called *virago*, becauſe made of the rib of the man.— The Latin tranſlator, by this, aimed to preſerve the etymology which is in the Hebrew, and of *vir*, formed *virago*; as Adam, in the Hebrew text, called Eve *Iſcha*, of iſch, man.

VIRGA. See the article YARD.

VIRGA*, is particularly uſed in law for a *verge*, or *rod*, ſuch as ſheriffs and bailiffs carry a badge of their office. See VERGE.

* *— Ranf. ap Howel, præpoſitus de Lantiffin amerciatus pro eo quod habuit in manu ſua coram juſticiariis hic* virgam *nigram & inhoneſtam, ubi habere debuiſſet* virgam *album & honeſtam certæ longitudinis, prout decet.* In ſeſſ. Itin. de Cardiff. 7 Hen. VI. See VERGERS.

VIRGÆ, in phyſiology, a meteor, called alſo *columellæ*, and *funes tentorii*; being an aſſemblage of ſeveral ſtreams of light, repreſenting a bundle of rods, or ropes. See METEOR.

It is ſuppoſed owing to the ſtreaming of the ſun beams through certain rimulæ, or chinks: at leaſt, through the more lax and open parts of a watery cloud; happening chiefly in the morning and evening.

There is alſo another kind, conſiſting not of ſtreams of mere white light, but, as it were, painted of various colours; like thoſe of the rainbow. See RAINBOW.

VIRGATA *Terræ*, or VIRGA *terræ*, a yard-land. See YARD-*Land*.

VIRGATORES *Servientes*, in Fleta, are vergers, or tipſtaves, who attend the judges. See VERGER, and SERJEANT *at Arms*.

VIRGIN, VIRGO, a female who has had no carnal commerce with man; or, more properly, who has ſtill the *flos virginis*, or maiden-hood. See VIRGINITY.

In the Roman Breviary, there is a particular office for *virgins* departed, anſwering to thoſe for ſaints, martyrs, and confeſſors. See OFFICE.

Critics and antiquaries are much divided about a feaſt held in that church in honour of S. Urſula, and her companions; who are ſaid in the Ritual, Legend, &c. to have been eleven thouſand *virgins*.

Some imagine there has been a miſtake in reading the antient rituals, wherein XI. M. V. which was only an abbreviation of *eleven virgin martyrs*, was read according to the numeral letters, *eleven thouſand virgins*.— F. Sirmond conjectures, that in the antient liſts of martyrs, there was found S. S. Urſula, and Undecimilla V. M. and that in lieu of Undecimilla, which is the name of a *virgin martyr*, the copiſts had made *undecimillia*, which is eleven thouſand.

By the Moſaic law, the prieſts are enjoined to take none to wife but thoſe that are *virgins*; the widow, the divorced, and the harlot are to be refrained from.

VIRGIN is alſo applied, by way of eminence, to Mary the mother of our Saviour; as conceiving, and bringing him forth without any breach of her chaſtity. See CONCEPTION, ANNUNCIATION, &c.

The fathers, many of them, with the modern churches, hold that the *virgin* not only conceived, but brought forth, or was delivered, without breach of her virginity; otherwiſe, ſays S. Auguſtin, it would be falſe which is ſaid in the creed, that he was born of a *virgin*.—'Tis even defined, that ſhe ſtill remained a *virgin* to the end of her life: whence the Greeks always call her αειπαρθενος, *ever virgin Mary*; and after them the Latins, *ſemper virgo*. Though, as this is not recorded in holy writ, many have denied it, and held, that ſhe had afterwards to do with Joſeph, and bore other children; and this as early as the time of Origen. Tertullian himſelf is produced as one that denied the perpetual *virginity*: and the like may be ſaid of Apollinaris and Eunomius, with their followers.

Theſe impugners of the perpetual *virginity* encreaſed afterwards to a great number, and are called by Epiphanius, *Antidicomarianitæ*; and were condemned under that name by the ſixth general council. The ſame were alſo called by the Latins *Helvediani*, from Helvedius a diſciple of Auxentius, whoſe name was made uſe of as having been refuted by S. Jerom. He was followed by Jovinian, a monk of Milan, as Jerom teſtifies; though S. Auguſtin ſpeaks otherwiſe, viz. that he held, that the *virgin* loſt her virginity in bringing forth: And Bonoſus, a biſhop in Macedonia, was condemned for the ſame poſition.

This error was founded on the ſame ſubtile interpretations of ſcripture: as, becauſe S. Matthew ſays, that Joſeph knew not Mary (εως) 'till ſhe had brought forth her firſt-born: from hence they infer, that he knew her afterwards: ſo becauſe he was called her firſt-born, they argue, that ſhe muſt have had a ſecond.— But the Jewiſh law determines what is meant by firſt-born, and affixes it to the apertion of the womb: *primogenitum omne quod aperit vulvam*, Luke ii. 22, 23.— But they add, that mention is made of the mother and brethren of Jeſus; John ii. 12. and Matth. xii. 46. But this the antient fathers, eſpecially of the Greek church, explain, after Origen, of ſome children of Joſeph by a former wife, of which ſome make ſix; the eldeſt of which was James, the brother of our Lord: But in reality there ſeems no neceſſity of ſuppoſing, from theſe texts, that Joſeph had any other offſpring; becauſe the language of the Jews included in the name of brethren, not only the ſtrict relation of fraternity, but alſo the larger of conſanguinity. See BROTHERS.

But the Helvedians further argue, that the ſcriptures not only call them the brothers of Chriſt, but declare them to be the ſons of Mary: for that the Jews, Matth. xiii. 35. ſay, "Is not "his mother called Mary, and his brethren James, and Joſes, "and Simon, and Judas?"— To this biſhop Pearſon anſwers, that Mary the mother of James and Joſes was a different perſon from Mary the *virgin*; which he ſhews, by comparing the accounts of John xix. 25. Matth. xxvii. 5, 6. and Mark xv. 40. where this Mary the mother of James, and the ſiſter of Mary the *virgin*, is repreſented as the wife of Cleophas.

Neſtorius and his adherents maintained, that the *virgin* could not, with any propriety, be called the *mother of God*; as being really no more than the *hoſteſs of God*: for that the eternal Word could not be conceived, and born of the womb of a *virgin*. See NESTORIANS.

This hereſy was condemned at the council of Epheſus; yet it has been lately revived in Holland, chiefly by a refugee monk, one Renoult.

Charity of the holy VIRGIN. } See { CHARITY.
Preſentation of the VIRGIN. } See { PRESENTATION.

VIRGIN is alſo applied, figuratively, to ſeveral things that retain their abſolute purity, and have never been made uſe of.— Thus,

VIRGIN-*Wax*, is that which has never been wrought, but remains as it came out of the hive. See WAX.

VIRGIN *Oil*, is what oozes ſpontaneouſly from the olive, &c. without preſſing. See OIL.

VIRGIN *Gold*, is that metal ſuch as it is got out of the oar, without any mixture or alloy; in which ſtate it is ſometimes ſo ſoft, that it will take the impreſſion of a ſeal. See GOLD.

VIRGIN *Copper*, is a native copper found in the mine, and which has never been melted down. See COPPER.

VIRGIN *Quickſilver*, is that found perfectly formed, and fluid, in the veins of mines; or, at leaſt, is got from the mineral earth, by mere lotion, without fire. See MERCURY.

VIRGIN *Parchment*, is that made of the ſkin of an abortive lamb, or calf. See PARCHMENT, and VELOM.

VIRGIN *Sulphur*. } See the article { SULPHUR.
VIRGIN's *Milk*. } See the article { LAC *Virginale*.

VIRGIN's *Thread*, a ſort of meteor that flies in the air, like ſmall untwiſted ſilk; and which falling upon the ground, or upon plants, changes itſelf in a form like a ſpider's web. See METEOR.

In theſe northern climates, it is moſt frequent in ſummer; the days being then temperately warm, the earth not exceeding dry, nor yet over-charged with moiſture.

This has formerly paſſed for a ſort of dew, of an earthy, ſlimy nature: but naturaliſts are now agreed, that the *virgin's threads* are no other than ſo many ſpiders webs. See WEB.

VIRGINALE *Clauſtrum*, in anatomy, the ſame as *hymen*. See HYMEN.

VIRGINEUS *Morbus*, the *virgin's diſeaſe*; the green-ſickneſs, or chloroſis. See CHLOROSIS.

VIRGINIS *Spica*. See the article SPICA,

VIRGINITY, VIRGINITAS, the teſt or criterion of a *virgin*; or that which entitles her to the denomination. See VIRGIN.

In the firſt ages of the Chriſtian church, *virginity* grew into great honour and eſteem; inſomuch, that the women were admitted to make ſolemn vows thereof in public.— Yet was it held infamous among the Jews, for a woman to die a maid. The veſtals, among the antients, and the nuns or religious, among the moderns, found guilty of a breach of the vow of *virginity*, are allotted a ſevere puniſhment; the firſt to be buried alive, the latter to be immured. See VESTAL, &c.

The phyſicians, both antient and modern, are exceedingly divided upon the ſubject of *virginity*: ſome holding that there are no certain marks, or teſtimonies thereof, and others that there are. Solomon ſays expreſly, there are four things too wonderful for him to know: "The way of an eagle in the air; of a "ſerpent on the rock; of a ſhip in the midſt of the ſea; and "the way of a man in a maid;" which our tranſlators have rendered, leſs juſtly, *the way of a man with a maid*.

Yet Moſes eſtabliſhed a teſt, which was to be concluſive among the Jews.— The nuptial ſheets, it ſeems, were to be viewed by the relations on both ſides; and the maid's parents were to preſerve them as a token of her *virginity*; to be produced, in caſe her huſband ſhould ever reproach her on that ſcore.

In caſe the token of *virginity* was not found thereon, ſhe was to be ſtoned to death at her father's door.

This teſt of *virginity* has occaſioned abundance of ſpeculation about the parts concerned; but the niceſt inquiries cannot ſettle any thing certain about them.— Dr. Drake ſays expreſly, that, whatever might be expected among the Jews, there is not the ſame reaſon to expect thoſe tokens of *virginity* in theſe countries: for beſides, that the Hebrews married extremely young, as is the cuſtom in all the eaſtern countries, there are ſeveral circumſtances which may here fruſtrate ſuch expectations, even in virgins not vitiated either by any male contact, or any wantonneſs of their own.

In effect, in theſe northern climates, the inclemency of the air expoſes the ſex to ſuch checks of perſpiration, as gives a great turn to the courſe of the humours, and drives ſo much humidity through the parts, as may extraordinarily ſupple and relax thoſe membranes from which the reſiſtance is expected; and from which, in hotter countries, it might more reaſonably be depended on.

What moſt commonly paſſes among us for a teſt of *virginity*, is the hymen: and yet the moſt curious among the anatomiſts are greatly divided not only about the figure, ſubſtance, place, and perforations of this famous membrane, but even about the exiſtence thereof; ſome poſitively affirming, and others as flatly denying it. See HYMEN.

As nice a point as that of *virginity* is among anatomiſts, the midwives and matrons treat it with leſs diffidence.— In the ſtatutes of the ſworn matrons, or midwives, of Paris, containing likewiſe divers formula's of reports, and depoſitions made in court, upon their being called to viſit girls that made their complaint of being deflowered, they lay down fourteen marks whereon to form a judgment.

Laur. Joubert, a famous phyſician of Montpellier, has tranſcribed three of theſe reports: one made to the provoſt of Paris, another in Languedoc; and a third in Bearn.— Theſe reports are very conſiſtent with each other; and contain fourteen marks of *virginity*, expreſſed in their proper terms; ſuch as were received among the women of that profeſſion, and authorized in court.

M. Joubert does not explain thoſe terms; nor do we find any explanation of them any where, but in another report of the 23d of October 1672, inſerted in the *Picture of Love* of Venette, a phyſician of Rochel; a copy of which, we ſhall here give in Engliſh.

‘ We, Mary Miran, Chriſtophlette Reine, and Jeanne Porte ‘ Poullet, ſworn matrons of the city of Paris, certify to all thoſe ‘ whom it may concern, that on the 22d of October, in this ‘ preſent year, at the appointment of Monſieur the provoſt of ‘ Paris, we went into the ſtreet de Pompierre, to a houſe next ‘ the ſign of the ſilver key, to view and viſit Olive Tiſſerand, ‘ of the age of 30 years; on a complaint made by her in court ‘ againſt James Mudont, citizen of Roche ſur Mer, for forcing ‘ and violating her the ſaid Olive: and having viewed and examined the whole with the eye, and finger, we find,

‘ *Les toutons devoyez*, that is, the breaſts looſe and flaccid, *mammæ* ‘ *marcidæ & flaccidæ: Les barres froiſsées, i. e.* the os pubis ‘ bruiſed, *os pubis colliſum: Le lippion recoquillé*, i. e. the hair ‘ curled up, *pubes in orbem ſinuata: L' entrepet ridé, i. e.* the ‘ perinæum or ſeam wrinkled, *perinæum corrugatum: Le pouvant debiſſé, i. e.* the vulva, or pudendum, tumbled and diſordered, *vulva diſſoluta & marceſcens: Les balunaux pendants,* ‘ *i. e.* the labia hanging down, *labia pendentia: Le lippendis* ‘ *pilé, i. e.* the edge of the labia bared of hair, *labiorum ora pilis* ‘ *defectæ: Les baboles abbatues, i. e.* the nymphæ beat down, ‘ *nymphæ depreſſæ: Les halerons demis, i. e.* the carunculæ undone, or opened *carunculæ diſſolutæ: L'entrechenat retourné,* ‘ *i. e.* the membranes which connect the caruncules inverted, ‘ *membrana connectens inverſa: Le barbidau ecorché, i. e.* the clitoris excoriated, *clitoris excoriata: Le guilboquet fendu, i. e.* ‘ the neck of the womb torn, *collum uteri dilaceratum: Le guillenard elargi, i. e.* the vagina ſtretched, or widened, *vagina* ‘ *dilatata: La dame du milieu retirée, i. e.* the hymen broke and ‘ gone, *hymen deductum: L'arriere foſſe ouverte, i. e.* the inner ‘ orifice of the womb opened, *os internum matricis apertum.* ‘ *— Le tout veu & viſité feuillet par feuillet nous avons trouvé* ‘ *qu'il, y avoit trace de* — The whole viewed and examined part ‘ by part, we find plainly the track or foot-ſtep of — *Omnibus* ‘ *ſigillatim perſpectis & perſcrutatis*, &c. — Accordingly we, ‘ the ſaid matrons, do certify it to be true, to you, Monſieur ‘ le provoſt, on the oath we have taken. — Done at Paris the ‘ 23d of *October*, 1672.’

In Peru, and ſeveral other provinces of South-America, we are aſſured by Pedro de Cieca, in the hiſtory of the Yncas, *&c.* that the men never marry, but on condition that the next relation, or friend of the maid's, ſhall undertake to enjoy her before him, and take away her *virginity*. — And our countryman Lawſon relates the like of ſome of the Indian nations of Carolina. — So little is the *flos virginis*, prized ſo much among us, valued by them.

VIRGO, in aſtronomy, one of the ſigns, or conſtellations of the zodiac, into which the ſun enters in the beginning of Auguſt. See Sign, and Constellation.

The ſtars in the conſtellation *Virgo*, in Ptolemy's catalogue, are 32; in Tycho's, 39; in the Britannic, 89. — The longitudes, latitudes, magnitudes, *&c.* whereof, are as follows:

Names and Situations of the Stars.	Sign.	Longitude.			Latitude.				Magnit.
		°	′	″	°	′	″

VIRGULA *Divina*, or *baculus divinatorius*, a forked branch in form of a Y, cut off a hazle-tree; by means whereof people have pretended to diſcover mines, ſprings, *&c.* under ground. See Mine, *&c.*

The method of uſing it is this: the perſon who bears it walking very ſlowly over the places where he ſuſpects mines or ſprings may be, the effluvia exhaling from the metals, or vapour from the water, impregnating the wood, makes it dip, or incline; which is the ſign of a diſcovery.

We find no mention made of this *virgula* in any author before the eleventh century: but from that time it has been in frequent uſe; divers fine names have been invented for it, ſome calling it *caduceus*, others *Aaron's rod*, &c.

Some diſpute the matter of fact, and deny it to be poſſible; others, convinced with the great number of experiments alledged in its behalf, look out for the natural cauſes thereof. — The corpuſcles, ſay theſe authors, riſing from the ſprings, or minerals, entring the rod, determine it to bow down, in order to render it parallel to the vertical lines which the effluvia deſcribe in their riſe.

In effect, the mineral, or watery particles are ſuppoſed to be emitted by means of the ſubterraneous heat, or of the fermentations in the entrails thereof: now the *virgula* being of a light, porous wood, gives an eaſy paſſage to thoſe particles, which, withal, are very fine and ſubtile; the effluvia then driven forwards by thoſe that follow them, and oppreſſed at the ſame time by the atmoſphere incumbent on them, are forced to enter the little interſtices between the fibres of the wood, and by that effort oblige it to incline or dip down perpendicularly, to become parallel with the little columns which thoſe vapours form in their riſe.

VIRGULA, in grammar, a term which Latin, French, and ſome other authors uſe for a point in writing, uſually called by us *comma*. See COMMA.

Virgula's, F. Simon obſerves, as an invention of the modern grammarians, to give the greater clearneſs to diſcourſe.— The uſe thereof was unknown to the antient Greeks and Romans, who wrote all without taking off the pen, ſo that their books lie all together without any diſtinction of points, and *virgula's*. See POINTING.

VIRGULTUM, in our antient law-books, is uſed for an holt, or plantation of twigs, or oziers. See WICKER.

Sometimes, alſo, for a coppice of young wood.— *Et præterea concedo* virgultum *meum & totam communiam dominii mei.* Mon. Angl.

In another place of the ſame work *virgultum*, or rather *virgulta*, may be taken for *virgata*, *viz.* — *Dedit prædictæ eccleſiæ unam* virgultam *terræ in manerio de Crumptone.* See YARD-*Land*.

VIRIDARIO *Eligendo*, a writ that lies for the choice of a verderor in the foreſt. See VERDEROR.

VIRIDE *æris*, the ſame as *ærugo*, or *verdegreaſe*. See VERDEGREASE.

VIRILE, ſomething that belongs, or is peculiar to man, or the male ſex.

Thus *virile* member, *membrum virile*, is frequently uſed for the penis. See PENIS.

VIRILE *Age*, *Ætas virilis*, is the ſtrength and vigour of a man's age, *viz.* from thirty to forty-five years, which is an age wherein we are equally removed from the extremes of youth and old age. See AGE.

The civil lawyers only make one age of youth and *virility*; and yet their different temperatures ſeem to require a diſtinction; for which reaſon, ſome compare youth to ſummer, and *virility* to autumn. See PUBERTY.

At Rome, the youth quitted the prætexta at fourteen or fifteen years of age, and took the *virile* gown, *toga virilis*, to ſhew, it ſeems, that they then entered on a ſerious age. See PRETEXTA, and TOGA.

M. Dacier will have it, that children did not take the pretexta till thirteen years of age, nor quit it for the *toga virilis*, till ſeventeen.

VIRILIA, a man's genitals, or privy members; including the penis, and teſtes. See PENIS, TESTICLE, GENERATION. *&c.*

The cutting off the *virilia*, according to Bracton, was felony by common law; and that, whether the party were conſenting or not*. See EUNUCH, and CASTRATION.

* — *Henricus Hall & A. uxor ejus capti & detenti in priſona de Evilcheſter, eo quod rectati fuerunt quod ipſi abſciderunt* virilia *Johannis Monachi, quem idem Henricus deprehendit cum prædicta A. uxore ejus.* Rot. Clauſ. 13 Hen. III.

VIRTSUNGIANUS* *Ductus*, or *Ductus* VIRTSUNGII, in anatomy, a canal, more uſually called *ductus pancreaticus*. See PANCREATIC.

* It took its name *virtſungianus*, from the inventor, *Virtſungius*, profeſſor at Padua.

VIRTUAL, *Potential*, ſomething that has a power, or virtue of acting, or doing. See VIRTUALLY.

The term is chiefly underſtood, of ſomething that acts by a ſecret inviſible cauſe; in oppoſition to *actual*, and *ſenſible*. See POTENTIAL.

VIRTUAL *Focus*, in optics, is a point from which rays, before converging, begin to diverge, or divaricate. See FOCUS.

Hence it is alſo called, *point of diſperſion*, or *divergency*; in oppoſition to the *focus*, which is called *the point of concurrence*. See POINT, DISPERSION, DIVERGENT, &c.

Suppoſe, *e. gr.* the concavity of a glaſs to be *a b c* (*Tab. Optics, fig.* 11.) and its axis *d e*; let *f g* be a ray of light falling on the glaſs parallel to the axis *d e*, and let *d* be the centre of the arch *a b c*.

This ray *f g*, after it has paſſed the glaſs, at its emerſion at *g*, will not proceed directly to *h*, but be refracted from the perpendicular *d g*, and become the ray *g k*.

Draw then directly *g k*, ſo that it may croſs the axis in *e*. — The point *e* ſo found, Mr. Molyneux calls the *virtual focus*, or *point of divergence*. Diopt. Nov.

VIRTUALITY, VIRTUALITAS, in the ſchools, denotes ſome mode or analogy in an object, which, in reality, is the ſame with ſome other mode, but out of regard to contradictory predicates, is conſidered as if diſtinct therefrom.

Thus the divine nature, and the perſon of the Word, are two *virtualities*; for though, in reality, they be the ſame, yet are they conſidered as things different.— For the perſon of the Word is ſaid to have been begotten, and his nature is ſaid not to be begotten; now begotten, and not begotten, are contradictory predicates.

And hence ariſe what we call *virtual diſtinctions*, whereby one *virtuality* is diſtinguiſhed from another, not one thing from another.

Thus it is, the divine nature is diſtinguiſhed from the divine perſon, and the divine underſtanding from the divine will. See TRINITY.

VIRTUALLY, VIRTUALITER, in the ſchools, is applied to a mode of exiſtence.— A thing is ſaid to be *virtually* any where, when it is deemed to be there by ſome *virtue*, influence, or other effect produced by it.— Thus the ſun is *virtually* on earth, *i. e.* by his light, heat, *&c.*

A thing is alſo ſaid to be *virtually* preſent, when the virtues, or properties belonging to it, and iſſuing from it, remain.— In which ſenſe, the forms of the elements are held to be *virtually* in mixed bodies. See PRESENCE.

A thing is alſo ſaid to be a cauſe *virtually*, or a *virtual cauſe*, and that two ways: the firſt, when there is no real diſtinction between it, and the effect attributed to it; and yet it is conceived by us, as if it were really the cauſe thereof.— Thus, immutability in God, is the cauſe of eternity.

Secondly, when an effect is not of the ſame kind with the cauſe, and yet the cauſe has the power or *virtue* of producing the effect: thus the ſun is not formally, but *virtually* hot; and fire is not contained formally, but *virtually* in heat. See CAUSE, EFFECT, &c.

VIRTUE, VIRTUS, a term uſed in various ſignifications.

In the general, it denotes *power*, or *perfection* of any thing, whether natural, or ſupernatural, animate, or inanimate, eſſential, or acceſſary.— Hence the *virtues*, that is, powers of God, angels, men, plants, elements, *&c.* See POWER, and FACULTY.

VIRTUE, in its more proper and reſtrained ſenſe, ſignifies a habit, which improves and perfects the haver, or poſſeſſor, and his actions. See HABIT, PERFECTION, &c.

In this ſenſe, *virtue* is a principle of acting, or doing well and readily; and that, either infuſed from above, ſuch as are the *theological virtues*; or acquired by our own application, as the *intellectual*, and *moral virtues*.

For as there are two things in man, from which all his actions proceed, *viz.* the underſtanding, and the will; ſo the *virtue*, by which he is perfected, or whereby he is diſpoſed to do all things rightly, and to live happily, muſt be twofold: the one, of the underſtanding; the other, of the will. That which improves the underſtanding is called *intellectual*, or *dianoetic*; and that, the will, *moral*, or *ethic* — For, ſince there are two things required in order to live aright, *viz.* to know what ſhould be done; and, when known, readily to perform it: and ſince man is apt to err various ways in each reſpect, unleſs regulated by diſcipline, *&c.* he alone can deport himſelf rightly in his whole courſe of life, whoſe underſtanding and will have attained their utmoſt perfection.

Intellectual **VIRTUE**, then, according to Ariſtotle, is a habit of the reaſonable ſoul, whereby it conceives, or ſpeaks the truth; either in affirming, or denying. See TRUTH.

The *virtues* which come under this claſs, are divided into *ſpeculative*; which are thoſe converſant about neceſſary things, that can only be known, or contemplated; and *practical*, which are converſant about contingent things, that may likewiſe be practiſed.

Ariſtotle has another diviſion of *intellectual virtue*, fetched from the ſubject; as ſome of them are ſeated in the επιςημονικη, or *contemplative part*, viz. thoſe converſant about neceſſary things, as *ſcience*, *wiſdom*, *intelligence*. See SCIENCE, UNDERSTANDING, &c.

And others, in the λογιςικη, or *practical part*; ſuch as thoſe converſant about contingent things, as *prudence*, *art*, &c. See ART, &c.

Moral **VIRTUE**, is defined by Ariſtotle, to be an elective habit, placed in a mediocrity, determined by reaſon, and as a prudent man would determine.

The Scotiſts maintain every moral habit to be indifferent, as to good or evil, and capable of becoming, ſucceſſively, either *virtue* or *vice*: *virtue*, if it have a relation of conformity with right reaſon; and *vice*, if it have not. See VICE.

According to them, therefore, *virtue* is a habit ſubjectively, but not entitatively, good: as it is only a relation of conformity, *&c.* which is ſeparable from the entity of the habit. The Thomiſts, on the contrary, aſſert *virtue* to be a habit eſſentially good; nor capable of miniſtring any thing to any act poſitively bad.— And they philoſophize thus: every habit eſſentially good, inclines to acts, like thoſe whereby it was acquired; thus, by doing juſtly, we become juſt; and, by abſtaining from forbidden pleaſures, we become temperate. But *moral virtue* is produced, or acquired by acts eſſentially good; good, we mean, both in reſpect of our duty, and of the motive and end: therefore *moral virtue* inclines only to good acts.

Others diſallow the peripatetic notion of *virtue*, as placed in a habit: for a habit, or hability, ſay they, includes two things; a cuſtom, and facility; the firſt as a cauſe, and the ſecond as an effect: ſo that a habit is nothing but a facility acquired by cuſtom.— They therefore who make *virtue* a habit of doing well, muſt, of neceſſity, aſcribe it to a frequent exerciſe of good actions.— But this cannot be; for the *virtue* muſt be before the good actions; and the habit, after them.— Indeed, whence ſhould the actions proceed, but from *virtue*? *Virtue* therefore is before the good actions, and certainly before a habit, reſulting from a frequency of good actions. Hence, they define *virtue* to be a firm purpoſe, or reſolution of doing whatever right reaſon demands to be done.— For though a cuſtom of doing well be required, to make a perſon eſteemed good among men; yet it does not follow, that that cuſtom or habit is the formal cauſe of that denomination, or the goodneſs itſelf.

Moraliſts uſually diſtinguiſh four *principal*, or, as they are vulgarly called, *cardinal virtues*, viz. *prudence*, *juſtice*, *fortitude*, and *temperance*: the reaſon of which diviſion is founded in this, that for a man to live *virtuouſly* and honeſtly, it is neceſſary he know what is fit to be done; which is the buſineſs of *prudence*. That he have a conſtant and firm will to do what he judges beſt; which will perfect the man, either as it reſtrains too violent perturbations, the office of *temperance*.—

Or, as it ſpurs and urges on thoſe that are too ſlow and languid, which is the buſineſs of *fortitude*.

Or, laſtly, comparatively, and with regard to human ſociety; which is the object of *juſtice*.

To theſe four all the other *virtues* are referred, either as parts, or as concomitants.

VIRTUES, in the celeſtial hierarchy, the third rank, or choir of angels; being that in order between *dominations*, and *powers*. See HIERARCHY.

To theſe is attributed the power of working miracles, and of ſtrengthening and reinforcing the inferior angels in the exerciſe of their functions. See ANGEL.

VIRTUOSO, an Italian term, lately introduced into Engliſh; ſignifying a man of curioſity and learning; or one who loves and promotes the arts and ſciences.

In Italy, *virtuoſi* are properly ſuch as apply themſelves to the polite arts of painting, ſculpture, turning, mathematics, muſic, *&c.*— A perſon who makes profeſſion thereof, is called *virtuoſo*, *queſto è un virtuoſo*.

Among us, the term ſeems appropriated to thoſe who apply themſelves to ſome curious and quaint, rather than immediately uſeful art or ſtudy: as antiquaries, collectors of rarities of any kind, microſcopical obſervers, *&c.*

VIRULENT, a term applied to any thing that yields a *virus*; that is, a contagious, or malignant pus. See PUS.

The *goonorrhæa virulenta*, is what we popularly call a *clap*. See GONORRHÆA.

VIS, a Latin word, ſignifying *force*, or *power*; adopted by phyſical writers, to expreſs divers kinds of natural powers, or faculties. See POWER, and FACULTY.

VIS *Inertiæ*, or *powers of inactivity*, is defined by Sir Iſaac Newton, to be a power implanted in all matter, whereby it reſiſts any change endeavoured to be made in its ſtate, *i. e.* whereby it becomes difficult to alter its ſtate, either of reſt, or motion. See INERTIA.

This power, then, coincides with the *vis reſiſtendi*, power of reſiſting, whereby every body endeavours, as much as it can, to perſevere in its own ſtate, whether of reſt, or uniform rectilinear motion: which power is ſtill proportional to the body, and only differs from the *vis inertiæ* of the maſs, in the manner of conceiving it.

Bodies only exert this power, in changes brought on their ſtate by ſome *vis impreſſa*, force impreſſed on them.— And the exerciſe of this power, is, in different reſpects, both reſiſtance, and impetus: reſiſtance, as the body oppoſes a force, impreſſed on it to change its ſtate; and impetus, as the ſame body endeavours to change the ſtate of the reſiſting obſtacle. *Phil. Nat. Princ. Math.* Lib. I.— See REACTION.

The *vis inertiæ*, the ſame great author elſewhere obſerves, is a paſſive principle, by which bodies perſiſt in their motion or reſt; receive motion, in proportion to the force impreſſing it, and reſiſt as much as they are reſiſted. See MOTION.

For the effect of the VIS Inertiæ, *in reſiſting and retarding the motion of Bodies*, &c. ſee RESISTANCE, and RETARDATION.

VIS *Impreſſa*, is defined by Sir Iſaac Newton, to be the action exerciſed on any body, to change its ſtate, either of reſiſting, or moving uniformly in a right line.

This force conſiſts altogether in the action; and has no place in the body after the action is ceaſed.— For the body perſeveres in every new ſtate, by the *vis inertiæ* alone.

This *vis impreſſa* may ariſe from divers cauſes, as from the percuſſion, preſſion, and centripetal force. See PERCUSSION, &c.

VIS *Centripeta*. See CENTRIPETAL *Force*.
VIS *Centrifuga*. See CENTRIFUGAL *Force*.
VIS *Motrix*. See MOTION.
VIS *Stimulans*. See STIMULATING.

VISCERA*, in anatomy, a term of equal import with *entrails*; including the heart, liver, lungs, ſpleen, inteſtines, and other inward parts of the body. See *Tab. Anat.* (*Splanch.*) *P.* 3. ſee alſo the articles BODY, HEART, LIVER, &c.

The word is alſo frequently uſed ſingularly, *viſcus*, to expreſs ſome particular part of the entrails; by reaſon the word *entrails* has no ſingular.

VISCIDITY, or VISCOSITY, the quality of ſomething that is *viſcid*, or *viſcous*, i. e. glutinous, or ſticky; like birdlime, which the Latins call by the name *viſcus*. See BIRDLIME.

Viſcid bodies, are thoſe which conſiſt of parts ſo implicated within each other, that they reſiſt, a long time, a compleat ſeparation, and rather give way to the violence done them, by ſtretching or extending each way. See PARTICLE, and COHESION.

The too great *viſcidity* of foods has very ill effects: thus, meals, or farinæ not fermented, gellies, *&c.* of animals, tough cheeſe, or curd too much preſſed, produce a weight or oppreſſion in the ſtomach; winds, yawnings, crudities, obſtructions of the minuter veſſels in the inteſtines, *&c.* Hence, an inactivity of the inteſtines themſelves, a ſwelling of the abdomen; and, hence, a *viſcidity* of the blood, from the reunion of the *viſcid* particles; obſtructions of the glands; paleneſs, coldneſs, tremors, *&c.*

VISCOUNT. See the article VICOUNT.

VISCUS, and VISCOSITY. See VISCERA, and VISSIDITY.

VISCUS; or VISCUM, in natural hiſtory, *&c.* See MISSLETOE.

VISIBLE, VISIBILE, ſomething that is an object of ſight, or viſion; or ſomething whereby the eye is affected, ſo as to produce a ſenſation. See VISION.

The ſchool philoſophers made two kinds of *viſibles*, or *viſible* objects: the one *proper*, or *adequate*; which are ſuch as are no other way perceivable, but by ſight alone: the other *common*; which are ſubject to divers ſenſes, as the ſight, hearing, feeling, *&c.*

Again, the firſt, or *proper object of viſion*, is of two kinds, *viz. light*, and *colour*, for theſe two are only ſenſible by ſight.— The firſt, and primary, *viz. light*, they make the formal, and *colour*, the material object. See OBJECT.

The Carteſians think they philoſophize better, when they ſay, that light, alone, is the proper object of viſion; whether it flow from a luminous body through a tranſparent medium, and retain its firſt name, *light*; or whether it be reflected from opake bodies, under a certain new modification, or habitude, and exhibit their images; or, laſtly, whether in being reflected, it is likewiſe refracted, after this, or that manner, and affects the eye with the appearance of *colour*.

But, agreeably to Sir Iſaac Newton's ſentiments, colour alone is the proper object of ſight: colour being that property of light, whereby the light itſelf is *viſible*; and whereby the images of opake objects are painted on the retina. See LIGHT and COLOUR.

Ariſtotle, *De Anima*, Lib. II. enumerates five kinds of common *viſibles*, which are uſually received for ſuch in the ſchools, *viz. motion*, *reſt*, *number*, *figure*, and *magnitude*.— Others maintain nine, as in the verſes;

> *Sunt objecta novem* viſus *communia*: quantum,
> *Inde* figura, locus, *ſequitur* diſtantia, ſitus,
> Continuumque & diſcretum, motuſque, quieſque.

Authors reaſon very variouſly as to theſe common objects of viſion: there are two principal opinions among the ſchoolmen.— The adherents to the firſt, hold, that the common *viſibles* produce proper repreſentations of themſelves, by ſome peculiar ſpecies or image, whereby they are formerly perceived, independently of the proper *viſibles*.

But the ſecond opinion prevails moſt, which imports, that the common *viſibles* have not any ſuch formal peculiar ſpecies to become *viſible* by; but that the proper objects are ſufficient to ſhew themſelves in this or that place, or ſituation, and in this or that diſtance, figure, magnitude, *&c.* by the circumſtances of their conveyance to the ſenſory.

In effect, ſince theſe common *viſibles* cannot be repreſented alone, (for who ever ſaw place, diſtance, figure, ſituation, *&c.* of itſelf) but are always conveyed along with the images of light and colour to the organ; what neceſſity is there to conceive any ſuch proper images, whereby the common *viſibles* ſhould be formally perceived by the ſoul? It is much more probable, that from the peculiar manner, wherein the ſenſitive faculty perceives a proper object, it is apprized of its being in this or that ſituation, or place; in this or that figure, magnitude, *&c.*— How this is affected, may be conceived from what follows.

I. The ſituation and place of *viſible* objects, are perceived without any intentional ſpecies thereof, merely by the impulſe being made from a certain place, and ſituation, either above, or below, on the right, or left, before, or behind; whereby the rays of the proper *viſibles* are thrown upon the retina, and their impreſſion conveyed to the ſenſory.

For ſince an object is ſeen by thoſe rays which carry its image to the retina, and in that place to which the viſive power is directed by the rays it receives: as it perceives the impulſe of the rays to come from any place, *&c.* it is abundantly admoniſhed of the object's being in that place, and ſituation. See PLACE.

From this principal, ſeveral remarkable phænomena of viſion are accountable for; as,

---

* The term if pure Latin, being formed of *veſci*, to feed; by reaſon, eatables, called in Latin *veſca*, undergo divers preparations in the *viſcera*. See DIGESTION, *&c.*

1°. That if the diſtance between two *viſible* objects be an angle that is inſenſible, the diſtant bodies will appear as if contiguous: whence, a continuous body being the reſult of ſeveral contiguous ones; if the diſtances between ſeveral *viſibles* ſubtend inſenſible angles, they will appear one continuous body: which gives a pretty illuſtration of the notion of a continuum. See CONTINUITY.

2°. If the eye be placed above a horizontal plane, objects, the more remote they are, the higher they will appear, till the laſt be ſeen in a level with the eye.— Whence it is, that the ſea, to perſons ſtanding aſhore, ſeems to riſe higher and higher the further they look.

3°. If any number of objects he placed below the eye, the moſt remote will appear the higheſt; if they be above the eye, the moſt remote will appear the loweſt.

4°. The upper parts of high objects appear to ſtoop, or incline forwards; as the fronts of churches, towers, &c.— And ſtatues atop of buildings, to appear upright, muſt recline, or bend backwards. See further under the articles REFRACTION, HORIZON, &c.

II. The mind perceives the diſtance of *viſible* objects, from the different configurations of the eye, and the manner wherein the rays ſtrike the eye, and the image is impreſſed thereon.

For the eye diſpoſes itſelf differently, according to the different diſtances it is to ſee, *viz.* for remote objects the pupil is dilated, and the cryſtalline brought nearer the retina, and the whole eye made more globous: on the contrary, for near objects, the pupil is contracted, the cryſtalline thruſt forwards, and the eye lengthened. See PUPIL, CRYSTALLINE, &c.

The diſtance, again, is adjudged of by the angle the object makes, from diſtinct or confuſed repreſentation of the object, and the briſkneſs or feebleneſs, the rarity or ſpiſſitude of the rays.

To this it is owing, 1°. That objects which appear obſcure or confuſed, are judged to be more remote: a principle which the painters uſe, to make ſome of their figures appear farther diſtant than others on the ſame plane. See PERSPECTIVE, &c.

To this it is likewiſe owing, that rooms whoſe walls are whitened, appear the ſmaller: that fields covered with ſnow, or white flowers, ſhow leſs than when covered with graſs: that mountains covered with ſnow, in the night-time, appear the nearer: that opake bodies appear the more remote in twilight. See DISTANCE.

III. The magnitude or quantity of *viſible* objects, is known chiefly by the angle comprehended between two rays drawn from the two extremes of the object, to the centre of the eye. See *Optic* ANGLE.

An object appears ſo big as is the angle it ſubtends: or bodies ſeen under a greater angle appear greater; and thoſe under a leſs, &c.— Hence, the ſame thing appears now bigger, and now leſs, as it is leſs or more diſtant from the eye.— This we call *apparent magnitude*. See MAGNITUDE.

Now, to judge of the real magnitude of an object, we conſider the diſtance: for ſince a near and a remote object may appear under equal angles, the diſtance muſt neceſſarily be eſtimated; that if it be great, and the optic angle ſmall, the remote object may be judged great, and vice verſa.

The magnitude of *viſible* objects, is brought under certain laws, demonſtrated by the mathematicians; as,

1°. That the apparent magnitudes of a remote object, are as the diſtances reciprocally.

2°. That the co-tangent of half the apparent magnitudes of the ſame objects, are as the diſtances: hence, the apparent magnitude and diſtance being given, we have a method of determining the true magnitude: the canon is this, As the whole ſine is to the tangent of half the apparent magnitude, ſo is the given diſtance to half the real magnitude.— The ſame canon, inverted, will, from the diſtance and magnitude given, determine the apparent one.

3°. Objects, ſeen under the ſame angle, have their magnitudes proportional to their diſtances.

4°. The ſubtenſe A B (*Tab. Optics, fig.* 51.) of any arch of a circle, appears of equal magnitude in all the points DCEG, though one point be vaſtly nearer than another; and the diameter DG, appears of the ſame magnitude in all the points of the periphery of the circle.— Hence we take a pretty hint for the moſt commodious form of theatres.

5°. If the eye be fixed in A, (*fig.* 52.) and the right line BC be moved in ſuch manner, as that the extremes thereof always fall on the periphery; it will always appear of the ſame magnitude.— Hence, the eye being placed in any angle of a regular polygon, the ſides will appear equal.

6°. If the magnitude of an object directly oppoſite to the eye, be equal to its diſtance from the eye, the whole object will be taken in by the eye, but nothing more.— Whence, the nearer you approach an object, the leſs part you ſee of it. See FLAME.

IV. The figure of *viſible* objects is eſtimated chiefly from our opinion of the ſituation of the ſeveral parts thereof.

This opinion of the ſituation, &c. enables the mind to apprehend an external object under this or that figure, more juſtly than any ſimilitude of the images in the retina with the object can; the images being frequently elliptical, oblong, &c. when the objects they exhibit to the mind are circles, ſquares, &c.

The laws of viſion, with regard to the figures of *viſible* objects, are,

1°. That if the centre of the pupil be exactly againſt, or in the direction of a right line, the line will appear as one point.

2°. If the eye be placed in the direction of a ſurface, ſo that only one line of the perimeter can radiate on it, it will appear as a line.

3°. If a body be oppoſed directly towards the eye, ſo as only one plane of the ſurface can radiate on it, it will appear as a ſurface.

4°. A remote arch, viewed by an eye in the ſame plane, will appear as a right line.

5°. A ſphere, viewed at a diſtance, appears a circle.

6°. Angular figures, at a diſtance, appear round.

7°. If the eye look obliquely on the centre of a regular figure, or a circle, the true figure will not be ſeen; but the circle will appear oval, &c. See FIGURE.

V. The Number of *viſible* objects is perceived, not only by one or more images formed in the fund of the eye; but alſo by ſuch a poſition of thoſe parts of the brain, whence the optic nerves ſpring, as the mind has been uſed to, in attending to a certain place, and that either ſingle, or manifold.

Accordingly when either of the eyes, with the contiguous part of the brain, are forced out of their juſt paralleliſm with the other, *v. gr.* by preſſing it with the finger, &c. all things appear double: but when they are in the requiſite paralleliſm, though their be two images in the fund of the two eyes, yet the object will appear ſingle.— Again, one thing may appear double, or even manifold, not only with both eyes, but even with only one of them open: by reaſon, the common concourſe of the cones of rays, reflected from the object to the eye, either falls ſhort of the retina, or goes much beyond it. See SEEING.

VI. Motion and reſt are ſeen, when the images of objects repreſented in the eye, and propagated to the brain, are either moved, or at reſt: and the mind perceives theſe images either moving or at reſt, by comparing the moved image to another, with reſpect to which it changes place; or, by the ſituation of the eye to the object being continually changed.

So that motion is only perceived, by perceiving the images to be in different places and ſituations: nor are theſe changes perceived, unleſs affected in time. So that to perceive motion, a ſenſible time is required.— But reſt is perceived by the viſual faculty, from the perception of the image in the ſame place of the retina, and the ſame ſituation for ſome ſenſible time.

Hence the reaſon, why bodies moving exceedingly faſt appear at reſt: thus, a live coal, ſwung briſkly round, appears a continued circle of fire; the motion not being commenſurate with *viſible* time, but much ſwifter than the ſame: ſo that in the time the ſoul requires to judge of any change of ſituation of the image on the retina, or that it is moved from this place to that, the thing itſelf performs its whole circuit, and is in its former place again.

Laws of viſion with regard to the motion of viſibles, are—

1°. That if two objects, unequally diſtant from the eye, move from it with equal velocity; the more remote one will appear the ſlower: or, if their celerities be proportionable to their diſtances, they will appear to move equally ſwift.

2°. If two objects, unequally diſtant from the eye, move with unequal velocities in the ſame direction, their apparent velocities are in a ratio compounded of the direct ratio's of their true velocities, and the reciprocal one of their diſtances from the eye.

3°. A *viſible* object, moving with any velocity, appears to be at reſt, if the ſpace deſcribed in the interval of one ſecond be imperceptible at the diſtance of the eye.— Hence it is, that a near object, moving very ſlowly, as the index of a clock, or a remore one very ſwiftly, as a planet, ſeem at reſt.

4°. An object, moving with any degree of velocity, will appear to reſt, if the ſpace it runs over in a ſecond of time be to its diſtance from the eye, as 1 to 1400: nay, in fact, if it be as 1 to 1300.

5°. The eye proceeding ſtreight, from one place to another, a lateral object, either on the right or left, will ſeem to move the contrary way.

6°. If the eye and the object move both the ſame way, only the eye much ſwifter than the object, that laſt will appear to go backwards.

7°. If two or more objects move with the ſame velocity, and a third remain at reſt, the moveables will appear fixed, and the quieſcent in motion the contrary way.— Thus, clouds moving very ſwifty, their parts ſeems to preſerve their ſituation, and the moon to move the contrary way.

If the eye be moved with a great velocity, lateral objects, at reſt appear to move the contrary way.— Thus, to a perſon, ſitting in a coach, and riding briſkly through a wood, the trees ſeem to retire the contrary way; and to people in the ſhip, &c. the ſhores ſeem to recede.

VISIBLE *Horizon*.	See the article	HORISON.
VISIBLE *Place*.		PLACE.
VISIBLE *Species*.		SPECIES.

VISIER, or VIZIER, an officer or dignitary in the Ottoman empire; whereof there are two kinds: the firſt called, by the Turks *viſier azem*, that is, *grand viſier*; firſt created in 1370, by Amurath I. in order to eaſe himſelf of the chief and weightier affairs of the government.

The *grand* or *prime viſier*, is the prime miniſter of ſtate of the whole empire.— He commands the army in chief, and preſides at the divan, or great council.— Renegado Chriſtians, have been ſometimes raiſed to the *viſierate*: ſuch were Khairedain, ſirnamed *Barbaroſſa*, Ulug Ali, Cuproli, &c.

Next to the *grand viſier*, are ſix other ſubordinate *viſiers*, called *viſiers of the bench*, who officiate as his counſellors, or aſſeſſors, in the divan.

VISION, Visio, the act of ſeeing, or of perceiving external objects by the organ of ſight. See Seeing, and Sight.

Viſion is well defined to be a ſenſation, whereby, from a certain motion of the optic nerve, made in the bottom of the eye by the rays of light emitted or reflected from objects, and hence conveyed to the common ſenſory in the brain, the mind perceives the luminous object, its quantity, quality, figure, &c. See Visible.

The phænomena of *viſion*, the cauſes thereof, and the manner wherein it is effected, make one of the greateſt and moſt important articles in the whole ſyſtem of natural knowledge. — Indeed, a great part of the phyſical, mathematical, and anatomical diſcoveries and improvements of the moderns terminate here; and only tend to ſet the buſineſs of *viſion* in a clearer light.

Hitherto refer what Sir Iſaac Newton and others have diſcovered of the nature of light, and colours; the laws of inflexion, reflexion, and refraction of the rays; the ſtructure of the eye, particularly the retina, and optic nerves, &c.

It is not neceſſary we ſhould here give a minute detail of the proceſs of *viſion* from its firſt principles: the greateſt part is already delivered under the reſpective articles.— The *eye*, the organ of *viſion*, we have deſcribed under the article Eye; and its ſeveral parts, tunics, humours, &c. under their proper heads, Cornea, Crystalline, &c.

The immediate and principal organ of *viſion*, *viz.* the retina, according to ſome, and the choroides, according to others, are diſtinctly conſidered: as alſo, the ſtructure of the optic nerve, which conveys the impreſſion to the brain; and the texture and diſpoſition of the brain itſelf, which receives them, and repreſents them to the ſoul. See Retina, Choroides, Optic *Nerve*, Brain, Sensory, &c.

Again, the nature of light, which is the medium, or vehicle, whereby objects are carried to the eye, is laid down at large under the articles Light, and Colours; and the chief properties thereof concerned in *viſion*, under Reflexion, Refraction, &c. and many of its circumſtances under Ray, Medium, &c.— What remains for this article, therefore, is only to give a general idea of the whole proceſs; in which all the ſeveral parts are concerned.

Different Opinions, or Syſtems of Vision.— The Platoniſts and Stoics held *viſion* to be effected by the emiſſion of rays out of the eyes; conceiving, that there was a ſort of light thus darted out, which, with the light of the external air, taking, as it were, hold of the objects, rendered them viſible; and thus returning back again to the eye, altered and new modified by the contact of the object, made an impreſſion on the pupil, which gave the ſentation of the object.

The reaſons whereby they maintain their opinion, are fetched, 1°. From the brightneſs and luſtre of the eye: 2°. From our ſeeing a remote cloud, without ſeeing one which we are incompaſſed withal; (the rays being ſuppoſed too briſk and penetrating to be ſtopped by the near cloud, but growing languid at a greater diſtance, are returned to the eye:) 3°. From our not ſeeing an object laid on the pupil: 4°. From the eye's being weary with ſeeing, *i. e.* by emitting great quantities of rays: and laſtly, From animals which ſee in the night; as cats, lions, moles, owls, and ſome men.

The Epicureans held *viſion* to be performed by the emanation of corporeal ſpecies, or images from objects; or, a ſort of atomical effluvia, continually flying off from the intimate parts of objects to the eye.

Their chief reaſons are, 1°. That the object muſt neceſſarily be united to the viſive faculty; and ſince it is not united by itſelf, it muſt be ſo by ſome ſpecies that repreſents it, and that is continually flowing from bodies: 2°. That it frequently happens, that old men ſee remote objects better than near ones; the diſtance making the ſpecies thinner, and more commenſurate to the debility of their organ.

The Peripatetics hold, with Epicurus, that viſion is performed by the reception of ſpecies; but differ from him in the circumſtances: for they will have the ſpecies (which they call *intentionales*) to be incorporeal.

It is true, Ariſtotle's doctrine of *viſion*, delivered in his chapter *de Aſpectu*, amounts to no more than this; That objects muſt move ſome intermediate body, that by this they may move the organ of ſight.— To which he adds, in another place, that when we perceive bodies, it is their ſpecies, not their matter, that we receive; as a ſeal makes an impreſſion on wax, without the wax's retaining any thing of the ſeal.

But this vague and obſcure account, the Peripatetics have thought fit to improve.— Accordingly, what their maſter called *ſpecies*, the diſciples underſtanding of real proper ſpecies, aſſert, That every viſible object expreſſes a perfect image of itſelf, in the air contiguous to it; and this image another, ſomewhat leſs, in the next air; and the third another, &c. till the laſt image arrives at the cryſtalline, which they hold for the chief organ of ſight, or that which immediately moves the ſoul.—Theſe images they called *intentional ſpecies*. See Species.

The modern philoſophers, as the Carteſians and Newtonians, give a better account of *viſion*.— They all agree, that it is performed by rays of light reflected from the ſeveral points of objects, received in at the pupil, refracted and collected in their paſſage through the coats and humours, to the retina; and thus ſtriking, or making an impreſſion on ſo many points thereof: which impreſſion is conveyed, by the correſpondent capillaments of the optic nerve, to the brain, &c.

As for the Peripatetic ſeries, or chain of images, it is a mere chimera; and Ariſtotle's meaning is better underſtood without, than with them.— In effect, ſetting theſe aſide, the Ariſtotelian, Carteſian, and Newtonian doctrine of *viſion* are very conſiſtent: for Sir Iſaac Newton imagines, that *viſion* is performed chiefly by the vibrations of a fine medium, which penetrates all bodies, excited in the bottom of the eye by the rays of light; and propagated through the capillaments of the optic nerves, to the ſenſorium.—And Des Cartes maintains, That the ſun preſſing the materia ſubtilis, wherewith the world is filled every way, the vibrations or pulſes of that matter reflected from objects, are communicated to the eye, and thence to the ſenſory: ſo that the action or vibration of a medium, is equally ſuppoſed in all. See Medium.

Modern Theory of Vision.— In order to *viſion*, we are certain, it is required that the rays of light be thrown from the viſible objects to the eye.—What befals them in the eye, will be conceived from what follows.

Suppoſe, *e. gr.* Z the eye, and A B C the object, (*Tab. Optics*, *fig.* 53.) Now, though every point of an object be a radiant point, that is, though there be rays reflected from every point of the object to every point of the circumambient ſpace, each carrying with it its reſpective colour, (which we falſly imagine to be thoſe of the object;) yet, as only thoſe rays which paſs through the pupil of the eye affect the ſenſe, we ſhall here conſider none elſe.

And, again, though there be a great number of rays paſſing from one radiant point, as B, through the pupil, yet we ſhall only conſider the action of a few of them; as B D, B E, B F.

Now then, the ray B D, falling perpendicularly on the ſurface E D F, will paſs out of the air into the aqueous humour, without any refraction, and proceed right to H; where, falling perpendicularly on the ſurface of the cryſtalline humour, it will go on, without any refraction, to M; where, again, falling perpendicularly on the ſurface of the vitreous humour, it will proceed ſtreight to the point O, in the fund or bottom of the eye. Again, the ray B E, paſſing obliquely out of the air upon the ſurface of the watery humour E D F, will be refracted, and approach towards the perpendicular E P: thus, proceeding to the point G, in the ſurface of the cryſtalline, it will be there refracted ſtill nearer to the perpendicular.— So alſo E G, falling obliquely out of air into a harder body, will be refracted towards the perpendicular G R; and falling on the point L of the ſurface of the vitreous humour, it will ſtill be brought nearer to M.

Laſtly, G L, falling obliquely out of a denſer, upon the ſurface of a rarer body L M N, will be refracted, and recede from the perpendicular L T; in receding from which, it is evident it appaoaches towards the ray B D O, and may be ſo refracted, as to meet the other in O.— In like manner, the ray B F, being refracted in B, will turn to I, and thence to N, and thence to the others in O.— But the rays between B E and B F, being ſomewhat leſs refracted, will not meet preciſely in the ſame point O.

Thus will the radiant point B affect the fund of the eye, in the ſame manner as if the pupil had had no breadth, or as if the radiant itſelf had only emitted one ſingle ray, ſuch as were equal in power to all thoſe between B E, and B F.

In like manner, the rays proceeding from the point A, will be ſo refracted in paſſing through the humours of the eye, as to meet near the point X; and the rays from any intermediate point between A and B, will nearly meet in ſome other point in the fund of the eye, between X and O.

Upon the whole, it may be aſſerted univerſally, that every point of an object, affects only one point in the fund of the eye; and, on the contrary, that every point in the fund of the eye, only receives rays from one point of the object.— Though this is not to be underſtood in the utmoſt rigour. See Radiant.

Now if the object recede from the eye, in ſuch manner, as that the radiant point B, does not decline from the line B D; the rays which would proceed from B, not enough divaricated, would be ſo refracted in paſſing the three ſurfaces, as that they would meet ere they reached the point O: on the contrary, if the object ſhould be brought nearer the eye, the rays paſſing from the point B to the pupil, too much divaricated, would be refracted ſo, as not to meet till beyond the point O. Nay, the object may be ſo near, that the rays proceeding from any point may be ſo divaricated, as that they ſhall never meet at all.— In all which caſes, there would be no point of the object, but would move a pretty large portion of the fund of the eye; and thus the action of each point would be confounded with that of the contiguous one.

And this would commonly be the caſe, but that nature has provided againſt it; either by contriving the eye, ſo as its bulb may be lengthened, or ſhortened, as objects may be more or leſs diſtant; or, as others will have it, ſo as that the cryſtalline may be made more convex, or more flat; or, according to others, ſo as that the diſtance between the cryſtalline and the retina may be lengthened or ſhortened.

The firſt expedient is the moſt probable; on the footing of which, when we direct our eyes to an object ſo remote, as that it cannot be diſtinctly viewed by the eye in its accuſtomed figure, the eye is drawn back into a flatter figure, by the contraction of four muſcles; by which means, the retina becoming nearer the cryſtalline humour, receives the rays ſooner: and when we view an object too near, the eye being compreſſed by the two oblique muſcles, is rendered more globular; by which means, the retina being ſet further off from the cryſtalline, does not receive the rays of any point before they meet.

It may be here added, that this acceſs, and receſs of the cryſtalline, is ſo neceſſary to *viſion*, that, whereas, in ſome birds the coats of the eye are ſuch a bony conſiſtence, that muſcles would not have been able to contract and diſtend them; nature has taken other means, by binding the cryſtalline down to the retina, with a kind of blackiſh threads, not found in the eyes of other animals.— Nor muſt it be omitted, that of the three refractions above mentioned, the firſt is wanting in fiſhes; and that to remedy this, their cryſtalline is not lenticular, as in other animals, but globular.— Laſtly, ſince the eyes of old people are generally worn flatter than thoſe of young ones; ſo that the rays from any point, fall on the retina ere they become collected into one; they muſt exhibit the object ſomewhat confuſedly: nor can ſuch eyes ſee any but remote objects diſtinctly. See PRESBYTÆ.— In others, whoſe eyes are too globular, the caſe is the reverſe. See MYOPES.

From what has been ſhewn, that every point of an object moves only one point of the bottom of the eye; and, on the contrary, that every point in the fund of the eye, only receives rays from one point of the object; it is eaſy to conceive, that the whole objects moves a certain part of the retina; that in this part there is a diſtinct, and vivid collection of all the rays received in at the pupil; and that as each ray carries its proper colour along with it, there are as many points painted in the fund of the eye, as there were points viſible in the object.— Thus is there a ſpecies, or picture, on the retina, exactly like the object; all the difference between them, is, that a body is here repreſented by a ſurface; a ſurface frequently by a line, and a line by a point: that the image is inverted, the right hand anſwering to the left of the object, *&c.* and that it is exceedingly ſmall, and ſtill the more ſo, as the object is more remote. See VISIBLE.

What we have ſhewn under other articles of the nature of light, and colours, readily accounts for this painting of the object on the retina.— The matter of fact is proved by an eaſy experiment, firſt tried by Des Cartes; thus: The windows of a chamber being ſhut, and light only admitted at one little aperture; to that aperture apply the eye of ſome animal newly killed, having firſt dextrouſly pulled off the membranes that cover the bottom of the vitreous humour, *viz.* the hind part of the ſclerotica, choroides, and even part of the retina; then will the images of all the objects, without doors, be ſeen diſtinctly painted on any white body, as on an eggſhell, that the eye is laid upon.— The ſame thing is better ſhewn by an artificial eye, or a camera obſcura. See EYE, and CAMERA *Obſcura*.

The images of objects, then, are repreſented on the retina; which is only an expanſion of the fine capillaments of the optic nerve, and from which the optic nerve is continued into the brain.— Now, any motion or vibration, expreſſed on one extreme of the nerve, will be propagated to the other: Hence the impulſe of the ſeveral rays, ſent from the ſeveral points of the object, will be propagated as they are on the retina, (*i. e.* in their proper colours, *&c.* or in particular vibrations, or manners of preſſure, correſponding thereto) to the place where thoſe capillaments are interwoven into the ſubſtance of the brain.— And thus is *viſion* brought to the common caſe of ſenſation.

For ſuch, we know, is the law of the union between the ſoul and body; that certain perceptions of the firſt, do neceſſarily follow certain motions of the laſt: but the different parts of the object do ſeparately move different parts of the fund of the eye; and thoſe motions are propagated to the ſenſory: it follows, therefore, that there muſt ariſe ſo many diſtinct ſenſations at the ſame time. See SENSATION.

Hence, 1°. we eaſily conceive, that the perception, or image in the mind, muſt be the clearer, and more vidid, the more rays the eye receives from the object: conſequently, the largeneſs of the pupil will have ſome ſhare in the clearneſs of *viſion*. See PUPIL.

2°. Conſidering only one radiant point of an object, we may ſay, that that point would move the ſenſe more weakly, or be ſeen more obſcurely, as it is more remote; by reaſon the rays coming from any point, like all qualities propagated in orbem, are always diverging; and therefore the more remote, the fewer of them will be received in at the pupil.— But, as it is not a ſingle point of an object, but all of them together, that affect the organ of ſenſe; and as the image of the object ſtill poſſeſſes a leſs part of the retina, as it is more remote; therefore, though the rays that flow from any point of an object two miles off, into the pupil, be rarer, or fewer by half, than thoſe flowing from the ſame point at a mile's diſtance; yet the ſame campillament of the optic nerve, which, in the latter caſe, would only be moved by that one point, in the former, will be affected with the joint action of the neighbouring points; and therefore the image be as clear as in the other caſe.— Add, that the pupil dilating itſelf more, as the object is more remote, takes in more rays than it would otherwiſe do.

3°. The diſtinctneſs of *viſion*, is ſomewhat concerned in the ſize of the image, exhibited in the fund of the eye.— For there ſhould be, at leaſt, as many extremes of capillaments, or fibres of the optic nerve, in the ſpace that image poſſeſſes, as there are particles in the object that ſends rays into the pupil: otherwiſe, every particle will not move its ſeparate capillament: and if the rays from two points fall on the ſame capillament, it will be the ſame, as if only one point had fell there; ſince the ſame capillament cannot be differently moved at the ſame time.— And hence it is, that the images of very remote objects being very ſmall, they appear confuſed, ſeveral points of the image affecting each capillament: and hence, alſo, if the object be of different colours, ſeveral particles affecting the ſame capillament at the ſame time, only the brighteſt and moſt lucid will be perceived: thus, a field, furniſhed with a good number of white flowers, among a much greater quantity of green graſs, *&c.* at a diſtance appears all white.

Our ſeeing of objects *ſingle*, though with two eyes, in each of which is a ſeveral image, or picture; and our ſeeing of them *erect*, whereas the picture inverted, are two great phænomena in *viſion*: which ſee conſidered under the articles SIGHT, and SEEING.— *For the manner of ſeeing, and judging of the diſtance and magnitude of objects,* ſee VISIBLE, MAGNITUDE, *&c.*

VISION, in optics.— The laws of *viſion*, brought under mathematical demonſtrations, make the ſubject of *optics*, taken in the greateſt latitude of that word: for among the writers of mathematics, optics is generally taken in a more reſtrained ſignification, for the doctrine of *direct viſion*; catoptrics, for the doctrine of *reflected viſion*; and dioptrics, for that of *refracted viſion*. See OPTICS, CATOPTRICS, and DIOPTRICS.

Direct, or *Simple* VISION, is that performed by means of direct rays; that is, of rays paſſing directly, or in right lines, from the radiant point to the eye. See DIRECT.— Such is that explained in the preceding article, VISION; ſee alſo RAY.

Reflected VISION, is that performed by rays reflected from ſpecula, or mirrors. See REFLECTION.— *The laws hereof, ſee under* REFLECTION, *and* MIRROR.

Refracted VISION, is that performed by means of rays *refracted*, or turned out of their way, by paſſing through mediums of different denſity; chiefly through glaſſes and lens's.— *The laws of this, ſee under the articles* REFRACTION, LENS, *&c.*

Arch of VISION. See the article ARCH.

VISION, among divines, is uſed for an appearance, which God occaſionally ſent his prophets and ſaints; either by way of dream, or in reality. See PROPHECY, REVELATION, *&c.* Such were the *viſions* of Ezekiel, Amos, *&c.* the *viſion* of S. Paul, lifted up to the third heaven, *&c.* of Joſeph, by which he was aſſured of the purity of the virgin, *&c.*

Many among the Romiſh ſaints ſtill pretend to *viſions*: the *Revelations of S. Bridget* are ſo many viſions. See REVELATION.

Hence the word has come into diſrepute, and become a common name for all chimeras, or ſpectres, which either our own folly or fear poſſeſſes us with: and hence, a perſon that frames to himſelf wild romantic notions, is called a *viſionary*. See ENTHUSIASM, FANATIC, &c.

Quevedo's *viſions*, are deſcriptions of what paſſed in the imagination of that author.

Beatific VISION, denotes the act whereby the angels and bleſſed ſpirits ſee God in paradiſe.

VISIR, VISIER, or VIZIER. See the article VISIER.

VISITATION, VISITATIO, an act of juriſdiction, whereby a ſuperior, or proper officer, *viſits* ſome corporation, college, church, or other public or private houſe, to ſee that the laws and regulations thereof be duly obſerved. See REFORM, and REFORMATION.

Among us, the biſhop of each dioceſe is obliged to hold a *viſitation* every third year, and the archdeacon the other two years;

to ſee that the diſcipline be well obſerved, the people well inſtructed; and take care, that neither the church, nor the paſtors thereof, receive any detriment. See BISHOP, ARCHDEACON, &c.

Anciently the regarder's office was expreſſed to be the *viſitation of manners*. See REGARDER, CENSOR, &c.

The lawyers hold it a branch of the king's prerogative, to *viſit* the univerſities, to enquire into the ſtatutes, and the obſervations of them; to expel delinquents, &c. But ſome of the colleges diſallow this privilege; and plead themſelves, by royal charters, exempt from all civil and royal *viſitations*. See UNIVERSITY.

Among the Romaniſts, the general of each religious order, is obliged to *viſit* the ſeveral monaſteries of order. See GENERAL, and ORDER.

In abbies, that are chiefs of their orders, there are particular officers, called *viſitors*; who are diſpatched into all the houſes and congregations depending on them, to ſee that the regular diſcipline is obſerved.

In Spain, there is a *viſitor*, and *inquiſitor general*.— The *viſitation* of the cloiſter belongs to the ordinary.— At Paris, the parliament *viſits* the ſeveral priſons and priſoners four times a year.

VISITATION, in a moral and religious ſenſe, is alſo applied to the afflictions that befal mankind; as coming from the hand of God, to try or prove them. In which ſenſe, the laſt plague among us is frequently called the *viſitation*.

VISIVE, VISIVUS, in the ſchool philoſophy, a term applied to the power of *ſeeing*. See VISION.

Authors are exceedingly divided, about the place where the *viſive faculty* reſides: ſome will have it, in the retina; others, in the choroides; others, in the optic nerves; others, as Sir Iſaac Newton, in the place where the optic nerves meet, before they come to the brain; and others, in the brain itſelf. See SIGHT, and SENSORY.

VISNE, VISNETUM, in law, a neighbouring place, or place near at hand. See VENUE.

VISUAL, ſomething belonging to the ſight, or ſeeing. See SIGHT, and SEEING.

VISUAL *Rays*, are lines of light, imagined to come from the object to the eye. See RAY.

All the obſervations of aſtronomers and geometers, are performed by means of the *viſual* rays, received in at the ſights, or pinnulæ of alhidades. See OBSERVATION, SIGHT, QUADRANT, LEVELLING, &c.

VISUAL *Point*, in perſpective, is a point in the horizontal line, wherein all the ocular rays unite. See POINT.

Thus, a perſon ſtanding in a ſtreight long gallery, and looking forwards, the ſides, floor, and ceiling ſeem to meet, and touch one another in a point, or common centre.

VISUAL *Angle*. } See the article { ANGLE.
VISUAL *Line*. } { LINE.

VISUM. See the article HABERE *facias Viſum*.

VITA, *Life*. } See the article { LIFE.
Cui in VITA. } { CUI.

Aqua VITÆ. See the article AQUA.

VITAL, VITALIS, in anatomy, ſomething that miniſters principally to the conſtituting, or maintaining of life in the bodies of animals. See LIFE.

Thus, the heart, lungs, and brain, are called *vital* parts. See PART, HEART, &c.

VITAL *Functions*, or *actions*, are thoſe operations of the *vital* parts, whereby life is effected; ſo as that it cannot ſubſiſt without them. See ACTION, MOTION, &c.

Such are the muſculous action of the heart; the ſecretory action in the cerebellum; the reſpiratory action of the lungs; the circulation of the blood and ſpirits through the arteries, veins, and nerves. See HEART, BRAIN, RESPIRATION, CIRCULATION, &c.

VITAL *Spirits*, are the fineſt, and moſt volatile parts of the blood. See SPIRITS, BLOOD, HEAT, FLAME, &c.

VITELLIANI, in antiquity, a kind of a tablet, or pocket-book, wherein people anciently uſed to write down their ingenious, humorous, and even wanton fancies and impertinencies: the ſame with what in Engliſh we may call a *trifle-book*. See *Martial*, Lib. XIV. Epig. viii.

Some will have them to take their name from *vitellus*, a yolk of an egg; by reaſon, the leaves were rubbed therewith.— Others derive the name from one *Vitellius* their inventor.

VITI *Chorea*. See the article CHOREA *Sancti Viti*.

VITRIFICATION, or VITRIFACTION, the act of converting a body into glaſs, by means of fire. See GLASS.

Of all bodies, fern-aſhes, ſand, bricks, and pebbles, *vitrify* the moſt eaſily. Accordingly, it is of theſe that glaſs is principally made.

Gold held, by Mr. Homberg, near the focus of the duke of Orlean's large burning concave mirror, at firſt ſmoaked, then changed, all of it that did not go off in fumes, into glaſs, of a deep violet colour.— The glaſs of gold weighs leſs than gold. *Memoirs of the Royal Academy*, 1702. See GOLD.

All metals, and even almoſt all natural bodies, ſufficiently heated, *vitrify*: and this *vitrification* is the laſt effect of the fire; after which the moſt intenſe heat of the largeſt burning-glaſs, will make no further alteration. See BURNING-GLASS, MIRROR, and FIRE.

Vitrification, ſome authors will have to be chiefly effected, by the ſalts uniting and incorporating with the metalline particles. See CALCINATION.

But, according to M. Homberg, all *vitrification* ariſes from the earthy part; which, being expoſed to a violent fire, and intimately penetrated by ſome other diſſolvent, commences glaſs. — Thus, ſuppoſing the principles of gold to be mercury, a metallic ſulphur, and an earth; the *vitrification* of gold is eaſily conceived: the mercury, being volatile, exhales in ſmoke, and leaves behind it the earth, and ſulphur, which are fixed; the ſulphur diſſolves the earth, and *vitrifies* it.

VITRIOL *, VITRIOLUM, a mineral ſubſtance, compoſed of an acid ſalt, intermixed with ſomething metalline. See MINERAL, SALT, &c.

* Some take the word *vitriolum* to be uſed *quaſi vitri oleum*, becauſe of its ſhining colour; but Menage rather derives it *à vitre colore*: the Latins call it *atramentum ſutorium*; and the Greeks, *chalcanthus*.

Vitriol is uſually conſidered as a ſalt, but is more properly ranked among the claſs of ſemi-metals; as having a metallic matter mixt or combined with its ſalt.

Vitriol is defined by Boerhaave, a ſaline, metallic, tranſparent glebe; diſſoluble in water, and fuſible and calcinable by fire. It acquires different names, according to the different places where it is dug: and the *vitriols* of thoſe alſo, differ from each other in denomination and colour, ſome being *white*, others *blue*, and others *green*.

Roman and Cyprus *vitriol*, for inſtance, is blue; and that of Sweden and Germany greeniſh: beſides which, there is alſo a white kind.

White vitriol partakes but little of any metal, *blue* partakes of copper, and *green* of iron. See IRON, &c.

M. Geoffroy, the elder, obſerves, that they all conſiſt of an acid ſalt, like that found in allum and ſulphur; excepting that in allum, the acid is mixed with an abſorbent earth, or calx: in ſulphur, it is united with certain fatty, bituminous parts; and it *vitriols* with metallic parts.

According to Boerhaave, *vitriols* conſiſt of a metallic part, with a ſulphur adhering, a menſtruous acid, and water.— In *blue vitriol*, the metal wherewith the acid, &c. is joined, is copper. See VENUS.— In *white vitriol*, called alſo *white copperas*, it is mixed with lapis calaminaris, or ſome ferruginous earth, intermixed with lead or tin. See COPPERAS.— In *green vitriol* the acid is joined with iron. * See MARS.

* In five ounces of *green vitriol*, M. Geoffroy, the younger, has found two of water, two of iron, and one of acid. Vid. *Hiſt. Acad. R. Scienc. an.* 1728. p. 45.

The antients give the name *chalcitis*, or *chalcanthum*, to *native vitriol*; or that which acquires its full perfection in the entrails of the earth, and which is a kind of mineral ſtone, of a reddiſh colour.— Of this they obſerved three different ſtates, or tranſformations: chalcitis, in its firſt ſtate, they called *miſi*; this afterwards turned into *melanteria*, and that into *ſori*. See CHALCITIS.

Some moderns take this chalcitis to be the ſame with the *colcothar* brought from Sweden and Germany; the beſt whereof is of a browniſh red colour, and a *vitriolic* taſte, and diſſolves eaſily in water; and when broke, is of the colour of ſhining copper. See COLCOTHAR.

All the other *vitriols* above-named, are really factitious, being only a kind of cryſtals, drawn, by means of water, from a ſort of marcaſite ordinarily found in mines, and called by naturaliſts, *pyrites*, or *quis*. See PYRITES.

Roman vitriol is made by expoſing theſe pyrites to the air, till ſuch time as they calcine, and change into a greeniſh, acid, *vitriolic* calx, or duſt; in which ſtate they are thrown into the water, and are afterwards, by boiling and evaporation, reduced into that kind of cryſtals ſent us from Italy.

All the other *vitriols* are made after the ſame manner; that is, much after the ſame manner as allum is made in England, or ſalt-petre in France. See ALLUM, and SALT-PETRE.

For *green vitriol*, they add a great number of pieces of iron to the liquor in the boiling; theſe raiſe a great ebullition.— As ſoon as the iron is diſſolved, they evaporate the diſſolution to a certain degree, and ſo let it cryſtallize.— The cryſtals being formed, there remains a thick, reddiſh, unctuous, ſtyptic, and aſtringent liquor; which M. Geoffroy calls *eau mere de vitriol*; as containing all the principles of the mineral, though diſunited.

The powder of this *vitriol* is exceedingly ſtiptic, and excellent for the cure of wounds, and the ſtopping of blood.— Its effects this way, have been raiſed, by the knavery of ſome, and credulity of others, to a kind of miracle; it being this that makes the baſis of the famous ſympathetic powder. See SYMPATHETIC.

The medicinal virtues of *vitriol* are very great; but all owing to the iron, or other metallic parts mixed with it, and therefore follow the kind of metal.— Thus, thoſe of *green vitriol* depend on the ſtypticity or aſtringency of iron, or Mars. See MARS, *&c.*

The eau-mere drawn from *green vitriol*, M. Geoffroy obſerves, does not differ any way, eſſentially, from a great number of preparations which the chymiſts have given us of *vitriol*, iron, and the lapis hæmatites: as the fixed and anodyne ſulphurs of *vitriol*, or Mars; arcana, and magiſteries of *vitriol*; tinctures, *&c.* of *vitriol*, Mafs, *&c.*— The common baſis of all which is iron exceedingly ſubtilized and attenuated. See IRON.

A ſolution of *vitriol*, mixed with a tincture of galls, becomes inſtantly exceeding black: and it is this is the common writing-ink. See INK.

M. Lemery, the younger, has a pretty hypotheſis to account for this blackneſs: he imagines, that as the *vitriol* whereof ink is made, is iron diſſolved by an acid, and intimately mixed therewith; and as galls are an alkali, or abſorbent, this alkali meeting the acids which hold the iron diſſolved, unites with them, and makes them let the iron looſe; which thereupon revivifies, and reſumes its natural blackneſs: ſo that, in ſtrictneſs, it is iron that we write withal.

This ſyſtem is confirmed hence: that of the five ſorts of *vitriol*, that of Cyprus or Hungary is the only one whoſe baſe is copper; that of the reſt is iron: and accordingly they all ſerve to make ink withal, except the firſt.

Some naturaliſts hold *vitriol* to be the root, or matrix of copper; becauſe, in the copper-mines, they never dig deeper than the glebe out of which the *vitriol* is drawn.

Vitriol affords ſeveral chymical preparations; as—*ſpirit of vitriol*, procured by firſt calcining, than diſtilling it. See SPIRIT.— *Oil of vitriol*, which comes out after the ſpirit, by heightening the fire wherewith that had been raiſed.— What remains after both, is *colcothar of vitriol.*— *Tartar of vitriol* is had by mixing *oil of vitriol* with oil of tartar per deliquium; a ſalt precipitating to the bottom, which being ſet to exhale and cryſtallize, is the *tartar of vitriol.* See TARTAR.

From the *colcothar of vitriol*, is prepared the ens veneris. See ENS *Veneris*.

Metallic VITRIOLS.— All metals, it is to be obſerved, may be converted into *vitriols*, by diſſolving them with acid ſpirits, and letting them ſtand to cryſtallize. See CRYSTAL, and CRYSTALLIZATION.

Factitious vitriols, being only metals diſſolved and cryſtallized in ſaline menſtruums, are frequently called by way of diſtinction, *metallic vitriols*, and *metallic ſalts*.

VITRIOL *of Iron*, *Vitriolum Martis*, is a preparation made by diſſolving iron, or ſteel, in oil or ſpirit of *vitriol*; then evaporating or drawing off the moiſture, and bringing the matter to cryſtallize, by ſetting it in a cool place.— This is alſo called *ſal martis*, or *ſalt of ſteel.* See CHALYBEAT.

VITRIOL *of Luna*, or *the Moon*, is the body of ſilver chymically opened, and reduced into the form of ſalt by the ſharp points of ſpirit of nitre. See LUNA, and SILVER.

VITRIOL *of Venus*, is a ſolution of copper in ſpirit of nitre, evaporated and cryſtallized, to gain the ſalt; called alſo *vitriol of copper.* See COPPER, *&c.*

Ros VITRIOLI. See the article ROS.

VITRIOLATED, among chymiſts, turned into *vitriol*, or having *vitriol* infuſed into it. See VITRIOL.

Tartar VITRIOLATED. See TARTARUM *Vitriolatum.*

VITRIOLIC, ſomething that has the quality of *vitriol*, or partakes of the nature of *vitriol.* See VITRIOL.

In this ſenſe, we ſay, *vitriolic ſpring*, *vitriolic ſtone*, *vitriolic ſpirits*, &c.— If iron be thrown into a *vitriolic* water, and the red ruſt ariſing on the ſurface of the iron be melted down, it will be found real copper; which is an inſtance of the tranſmutation of one metal into another. See TRANSMUTATION.

VITRIOUS, or VITREOUS, in anatomy, the third, or glaſſy humour of the eye, thus called from its reſemblance to melted glaſs. See HUMOUR, and EYE.

It lies under the cryſtalline; by the impreſſion of which, its fore-part is rendered concave. See CRYSLALLINE.

For the office of the *vitrious humour*, ſee VISION.

Some authors alſo call the coats or membranes that contain this humour, *vitrious tunics*.

VITTA, among anatomiſts, *fillet*, or *head-band*; is uſed for that part of the amnios, which ſticks to the infant's head when it is juſt born. See AMNIOS, CAWL, &c.

VITUS's *Dance*, in medicine. See CHOREA *Sancti Viti*.

VIVA *Pecunia*, was anciently uſed for live cattle. See PECUNIA, MONEY, &c.

VIVA VOCE, q. d. by word of mouth. See ORAL, WITNESS, EVIDENCE, DEPOSITION, &c.

VIVARY, VIVARIUM, in our law-books, is ſometimes uſed for a park, warren, or fiſh-pond, wherein living creatures are kept, *&c.* See PARK, WARREN, *&c.*

VIVIFICATION, in medicine, the art of *vivifying*, that is, of contributing to the action that gives life, or maintains life. See LIFE.

The chymiſts alſo uſe the word, in ſpeaking of the new force, vigour, and luſtre, which, by this art, they give to natural bodies, particularly to mercury; which, after having been fixed or amalgamated, they reſtore to its firſt ſtate. See REVIVIFICATION.

VIVIPAROUS, VIVIPARUS, in natural hiſtory, an epithet applied to ſuch animals as bring forth their young alive, and perfect: in contradiſtinction to ſuch as lay eggs; which are called *oviparous animals.* See ANIMAL, OVIPAROUS, and EGG.

Vipers are diſtinguiſhed from ſnakes, in that the latter lay eggs in dunghils, to be hatched by the warmth thereof; but the former are *viviparous*, that is, lay their eggs within their bellies, and bring forth live vipers. See VIPER.

In the *Philoſophical Tranſactions*, we have an account of a *viviparous fly*, of the oeſtrum or gad-kind.— Dr. Liſter tells us, he opened ſeveral females of this claſs, and found, in each, two bags of live white worms.— The like is hinted by Aldrovandus.— Liſter even ſuſpects, that all of this tribe are, in ſome meaſure, *viviparous.* See INSECTS.

VIVO, in architecture, the ſhaft, or fuſt of a column.– See *Tab. Architect. fig.* 24. *lit. r*; ſee alſo SHAFT, and COLUMN.

The term is alſo uſed, in a more particular ſenſe, for the naked of a column, or other part. See NAKED.

VIVUM *Linum.* } See the article { LINUM.
VIVUM *Sulphur.* } { SULPHUR.

VIZARD, or VIZOR. See the article MASQUE.

VIZIER. See the article VISIER.

ULCER, ULCUS, in medicine, a ſolution, or diſcontinuity of texture, or loſs of ſubſtance in the fleſhy parts of the body, proceeding from an internal cauſe. See SOLUTION.

Galen defines *ulcer* an inveterate eroſion of the ſoft parts of the body; by which, inſtead of blood, they are brought to yield a kind of pus, or ſanies; which prevents the conſolidation.

Etmuller defines an *ulcer*, a ſolution of continuity from ſome corroſive ſharpneſs or acidity, that takes away from the parts, and turns the proper nouriſhment of the body into a ſanious matter.— A like ſolution of continuity happening in a bony part, is called a *caries*. See CARIES.

Galen commonly uſes the words *ulcer* and *wound* indifferently; but the Arabs, and the moderns after them, diſtinguiſh between the two. See WOUND.

Spontaneous *ulcers*, are generally ſuppoſed to proceed from acrimony, or a corroſive diſpoſition of the humours of the body; whether brought on by poiſons, the venereal taint, or other cauſes.

Ulcers are divided into *ſimple*, and *compounded.*— They are again divided, with regard to their circumſtances, into *putrid*, or *ſordid*, wherein the fleſh all around is corrupted, and fetid. — *verminous*, where the matter being thick, does not flow away, but generates worms, *&c.*— *virulent*, which inſtead of pus, or ſanies, yield a malignant virus, *&c.*

They are again diſtinguiſhed, with regard to their form, into *ſinuous*, *fiſtulous*, *varicous*, *carious*, &c.

When an *ulcer* happens in a good conſtitution, and proves eaſy of cure, it is ſaid to be *ſimple*.

When attended with other concurring ſymptoms, as a cacochymic habit, which greatly retards or obſtructs the cure, it is called a *compound ulcer*.

A *ſimple ulcer* is attended with no other ſign, than that of eroſion; but *compound ulcers*, happening in a ſcorbutic, dropſical, or ſcrophulous conſtitution, may be attended with pain, a fever, convulſions, a large and emaciating diſcharge of matter, inflammation and ſwelling of the part, calloſity of the lips, a caries of the bones, *&c.*

A Putrid or ſordid ULCER, is that whoſe ſides are lined with a tough, viſcous humour, and is alſo attended with heat, pain, inflammation, and a large flux of humours to the part: with time the ſordes increaſe and change colour, the *ulcer* corrupts, its matter grows fetid, and ſometimes the part gangrenes.— Putrid fevers often gives riſe to this kind of *ulcer*.

Phagedænic ULCER, is an *ulcer* of a corroſive nature, eating away the adjacent parts all around; the lips thereof remaining tumefied.— When this kind of *ulcer* eats deep, and ſpreads wide, without being attended with a tumour, but purtifies, and grows foul and fetid, it is called *noma*; and both, on account of the difficulty wherewith they heal, are alſo termed *dyſepulota*. See PHAGEDÆNA, &c.

Varicous ULCERS, are ſuch as being ſeated in the veins, and becoming painful and inflammatory, ſwell up the part they poſſeſs.— Theſe, when recent, being occaſioned by the uſe of corroſives, or proceeding from a ruptured varix, are often attended with an hæmorrhage.— The veins adjacent to the *ulcers* are, in this caſe, præternaturally diſtended, and may, ſometimes, be felt interwoven together, like net-work, about the part.

Sinous ULCERS, are ſuch as run aſlant, or ſideways from their orifice; and may be known either by ſearching with the probe, wax-candle, *&c.* or the quantity of matter they diſcharge, in proportion to their apparent magnitude.— Theſe ſometimes lie deep, and have ſeveral turnings: they are diſtinguiſhed from fiſtula's only by their want of calloſity, except in the very orifice. See SINUS.

Fiſtulous ULCERS, are ſuch as are ſinous, or winding, and attended with great calloſity; and diſcharge a thin, ſerous, and fetid matter. See FISTULA.

Old ULCERS are rarely cured without the uſe of internals, which are to be ſuch as abſord and deſtroy the acidity; ſudorifics eſpecially, decoctions of the woods, antimonials, viperines, and volatiles; but above all things, vomitories often repeated: in the moſt obſtinate *ulcers*, mercurial ſalivation is often required; old *ulcers* are frequently incurable, without making an iſſue in the oppoſite part.

The cure of ſimple, ſhallow *ulcers*, is commonly effected by applying a pledget armed with liniment. arcæi, or baſilic. flav. to the part, a plaiſter of diachyl. ſimp. or de mino, being laid over it, and repeating the dreſſing once aday, or ſeldomer. If only the cuticula be loſt, or eaten away, nothing more than a little unguent. deſiccativ. rub. or diapomphol. *&c.* ſpread thin upon linen, need be applied.

If ſpongy fleſh ſhould grow up, in either caſe it may be kept down with a little Roman vitriol, *&c.* as in caſe of healing up the ſimple *ulcers*, made by the breaking of common tumors.

Evacuations are indiſpenſibly neceſſary in the cure of *ulcers* of the compound kind, where the conſtitution will admit thereof.— If the *ulcer* be fiſtulous, ſinuous, cancerous, *&c.* and the matter fetid, thin, or ſanious, it is found proper to join calomel with the purgatives, or to give it in ſmall doſes, between the repetitions thereof, ſo as not to ſalivate.

Beſides the uſe of evacuating medicines, it will here alſo be proper to order a courſe of diet-drink, made with the ſudorific woods, eſpecially where the *ulcer* is ſuſpected to be venereal. — In the mean time, proper dreſſings are to be uſed.

When the *ulcer* obſtinately reſiſts this treatment, a ſalivation is generally propoſed, and ſeldom fails to promote the cure, though all other remedies ſhould have been tried in vain.— If the patient be too weak to undergo the fatigue of a thorough ſalivation, it may be moderated, and kept up the longer, in proportion to his ſtrength. See SALIVATION.

External medicines for *ulcers*, are digeſtives, cleanſers, ſarcotics, and epulotics.— M. Belloſte gives us a medicine of ſingular efficacy in the cure of *ulcers*; and it is no more than a decoction of walnut-tree leaves in water, with a little ſugar; in which a linen cloth being dipped, is to be laid on the *ulcer*, and this to be repeated every ſecond or third day.— This ſimple and vulgar medicine he finds ſuppurates, deterges, incarnates, reſiſts putrefaction, *&c.* more than any other medicine known.

An *ulcer* in the lungs, makes what we call a *phthiſis*. See PHTHISIS.

The venereal diſeaſe is a grand ſource of *ulcers*; particularly in the prepuce and glans, in men; the vagina, *&c.* in women; and in the mouth and palate in both. See VENEREAL *Diſeaſe*.

Venereal ulcers are of various kinds; thoſe that grow callous and cancerous, are called *ſhankers*. See SHANKER.

ULCERATED *Cancers*. See the article CANCER.

ULCERATION, EXULCERATIO, a little aperture, or hole in the ſkin, cauſed by an *ulcer*. See EXULCERATION.

Cauſtic medicines ſometimes occaſion *ulcerations* in the ſkin. See CAUSTICS. — Arſenic always *ulcerates* the parts it ſticks to.— A flux at the mouth *ulcerates* the tongue and palate. See ARSENIC, and SALIVATION.

ULIGINOUS, ULIGINOSUS, implies as much as moiſt, mooriſh, fenny. See FEN, MORASS, *&c.*

ULLAGE *of a caſk*, is ſo much as a veſſel wants of being full. See GAUGING, and SLIDING-*Rule*.

ULNA, in anatomy, a long, hard bone in the arm, with a cavity in the middle; called alſo *focile majus*, and *cubitus*.— See *Tab. Anat.* (*Oſteol.*) *fig.* 3. *n.* 8. *fig.* 7. *n.* 10. ſee alſo the articles ARM, and CUBITUS.

The *ulna* lies on the inſide of the fore-arm, reaching from the elbow to the wriſt; is big at its upper end, and grows ſmaller to its lower end.

At its upper it has two proceſſes, which are received into the fore and hind ſinus's of the extremity of the humerus.—The foremoſt proceſs is ſmall and ſhort; the hindmoſt, called ολεκρανον, is bigger and longer; it ſtays the fore-arm, when it comes to a right line with the arm. See OLECRANON.

Betwixt theſe proceſſes it has a ſemicircular ſinus, which receives the inner protuberance of the lower end of the humerus, upon which we bend and extend our fore-arm; and along the middle of that there runs a ſmall ridge, by which this bone is articulated to the humerus by ginglymus.— Had the articulation here been an arthrodia, the joint muſt have been much weaker; but the hand could have received no more motion from it, than it has now from the ſhoulder.

The inſide of this upper end has a ſmall ſinus, which receives the circumference of the round head of the radius. – Its lower extremity, which is round and ſmall, is received into a ſinus, in the lower end of the radius; and upon this extremity, it has a ſhort and ſmall proceſs, from which the ligaments which tie it to the bones of the wriſt ariſe: this proceſs ſerves to keep the bones of the wriſt in their place.

ULNA, an *ell* in meaſure. See ELL, and MEASURE.

ULNA *Ferrea*, denotes the ſtandard iron ell, kept in the Exchequer. See STANDARD.

ULNAGE. See the article ALNAGE.

ULNARIS *Extenſor*, in anatomy, a muſcle, called alſo *extenſor carpi*.— See *Tab. Anat.* (*Myol.*) *fig.* 1. *n.* 38. ſee alſo the article EXTENSOR.

ULNARIS *Flexor*. See the article FLEXOR *Carpi*.

ULTERIOR, in geography, is applied to ſome part of a country, or province, which, with regard to the reſt of that country, is ſituate on the ſarther ſide of a river, mountain, or other boundary, which divides the country into two parts. Thus, Africa, with regard to Europe, is divided by mount Atlas, into *citerior*, and *ulterior*, i. e. into two portions, the one on this ſide mount Atlas, and the other on that.

ULTIMA *Baſia*, *laſt kiſſes*, is a phraſe uſed among ſome painters, for the laſt finiſhing touches with the pencil. See PAINTING.

ULTRAMARINE *, ULTRAMARINUM, a beautiful blue colour, uſed by the painters, prepared from lapis lazuli. See BLUE, and LAPIS.

* Some derive its name, *ultramarine*, q. d. beyond ſea, from its being firſt brought into Europe, out of India, and Perſia: Others ſay, it is becauſe its colour is deeper than that of the ſea.

This blue is one of the richeſt, and moſt valuable colours, uſed in painting.— The preparation conſiſts, in firſt calcining the lapis in an iron pot or crucible, then grinding it very fine on porphyry ſtone; then mixing it up with a paſte made of wax, pitch, maſtick, turpentine, and oil; and at laſt waſhing the paſte well in clear water, to ſeparate the colouring part from the reſt, which precipitates to the bottom, in form of a ſubtile, beautiful, blue powder.— The water is then poured off, and the powder at bottom dried in the ſun; which is the true *ultramarine*.

Thoſe who prepare this colour, have uſually four kinds, which they procure by ſo many different lotions: the firſt is ſtill the beſt; and the reſt worſe and worſe, to the laſt.— There is *ultramarine* of the firſt kind, ſold for 11 *l.* ſterling *per* ounce; and of the laſt, for about 12 or 15 *s.*

The common opinion concerning its origin is, that the method of making it was firſt diſcovered in England; and that a member of the Eaſt India company, having a quarrel with his aſſociates, to be revenged of them, made the ſecret public.

Ultamarine muſt be choſen of a high colour, and well ground, which is known by putting it between the teeth, where, if it feel gritty, it is a ſign the triture is not ſufficient.

To know whether it be pure and unmixed, put a little of it in a crucible, and heating it red hot, if the powder has not changed its colour after this trial, it is certainly pure: on the contrary, if you perceive any change, or any black ſpecks in it, it is falſified.

Beſides this, there is another kind, called *common*, or *Dutch ultramarine*; which is only lapis, or ſmalt well ground, and pulverized; the colour whereof, when uſed by the painters, is much like that of the true *ultramarine*, though much leſs valued.

ULTRAMONTANE, ſomething beyond the mountains. The term is principally uſed, in relation to Italy and France, which are ſeparated by the mountains of the Alps.

In France, the opinions of the *ultramontane* canoniſts, *i. e.* of thoſe of Italy, are not received.

The painters, particularly thoſe of Italy, call all thoſe that are not of that country, *ultramontanes*; or, ſimply, *tramontanes*. — Pouſſin is the only *tramontane* painter that the Italians ſeem to envy. See TRAMONTANE.

ULTRAMUNDANE, ULTRAMUNDANUS, *beyond the world*; is that part of the univerſe, ſuppoſed to be without, or beyond the limits of our world, or ſyſtem. See UNIVERSE, WORLD, &c.

UMBELICUS. See the article UMBILICUS.

UMBELICAL. See the article UMBILICAL.

UMBELLA, or UMBRELIA. See the article PARASOL.

UMBELLÆ, UMBELLIS, among botaniſts, the round tufts, or heads of certain plants, ſet thick together, and all of the ſame heighth.— *Sparſed*, or thin *umbellæ*, are thoſe which ſtand at a diſtance from one another, yet all of an equal heighth. See UMBELLIFEROUS.

UMBELLIFEROUS *Plants*, are ſuch as have their tops branched, and ſpread out like an umbrella; on each a little ſubdiviſion of which, there is growing a ſmall flower: ſuch are fennel, dill, *&c.* See PLANT.

This flower is always pentapetalous; and is ſucceeded by two naked ſeeds adjoining to each other, which are the true characteriſtics that diſtinguiſh theſe plants from others.

The *umbelliferous* are a very large genus of plants, and are diſtinguiſhed by Mr. Ray, into,

1°. Such as have a compounded leaf, of a triangular and pinnate form.— The ſeeds of theſe are either broad, flat, and plain, almoſt like leaves; as the ſphondylium, paſtinaca latifolia, panax heracleum tordylium, orcoſelinum, thyſſelinum, apium cicutæ foliis, daucus alſaticus carvifolia, anethum, pucedanum, thapſia, ferula, *&c.* Or with a ſeed more tumid, and leſs compreſſed and flat, than the former; as the cachrys,

laſerpitium, cicutaria vulgaris, ſcandix, cereſolium, myrrhis ſativa angelica, leviſticum, ſiler montanum, bulbocaſtanum, ſiſarum, oenanthe, ſium, pimpinella, apium, cicuta, viſnaga, ſaxifraga, crithmum, fœniculum, daucus vulgaris, aniſum, caucalci, coriandrum, paſtinaca marina, *&c.*

2°. Such as have a ſimple, or undivided leaf, or at leaſt one only a little jagged; as the perfoliata, buplerum, aſtrantia nigra, ſanicula, and the ſeſeli æthiopicum.

UMBELLIFORM *flowers.* See the article **Flower.**

UMBER, or **Umbre**, **Umbria**, among painters, *&c.* a dry duſky colour'd earth, which, diluted with water, ſerves to make a dark brown colour, uſually call'd with us a hair-colour.

It is called *umber* from *umbra*, ſhadow; as ſerving chiefly for the ſhadowing of objects: or rather from *Umbria*, a country of Italy, whence it is uſed to be brought. See **Shadow.**

UMBILICAL, **Umbilicalis**, in anatomy, ſomething that relates to the *umbilicus*, or navel. See **Umbilicus**, &c.

Umbilical *Region*, is that part of the abdomen lying round about the *umbilicus*, or navel. See **Abdomen**, and **Region.**

Umbilical *Veſſels*, are a ſet or aſſemblage of veſſels belonging to a fœtus; conſtituting what we call the *funiculus umbilicalis*, or navel-ſtring. See **Foetus**, **Secondine**, &c.

Theſe veſſels are two arteries, a vein, and the urachus.

The **Umbilical** *arteries* ariſe from the iliacs, near their diviſion into external and internal; and paſs thence on each ſide of the bladder, through the navel, to the placenta.—See *Tab. Anat. (Angeiol.) fig.* 1. *n.* 56. 56. *fig.* 3. *lit. e. e. fig.* 16. *l. g. g.*

The **Umbilical** *vein*, from innumerable capillaries united into one trunk, deſcends from the placenta, to the liver of the fœtus; where it is partly diſtributed into the porta, and partly into the cava.—See *Tab. Anat. (Angeiol.) fig.* 4. *lit. c. (Splanch.) fig.* 3. *lit. i. fig.* 16. *lit. f.*

The urachus is only plainly found in brutes; though there is no doubt but it has place likewiſe in mankind. See **Urachus.**

The uſe of theſe veſſels, is to maintain a continuity and communication, between the mother and the fœtus.—Some authors will have it, that the fœtus receives its food and increaſe this way; and that it grows, like a vegetable, from the mother as the root, of which the *umbilical veſſels* are the ſtem; and the child the head or fruit of this plant-animal. See **Circulation**, **Nutrition**, **Foetus**, *&c.*

Funiculus **Umbilicalis**, popularly called the *navel-ſtring*, is a kind of ſtring, formed of the *umbilical veſſels*; which, being tied up in a common coat, or membrane, traverſe the ſecundines, and are inſerted, at one end, into the placenta of the mother, and at the other, into the abdomen of the fœtus.—See *Tab. Anat. (Splanch.) fig.* 16. ſee alſo the article **Umbilical** *Veſſels.*

The navel-ſtring is membranous, wreathed, and unequal; ariſing out of the middle of the abdomen, and reaching to the placenta uterina: it is uſually half an ell in length, and as thick as one's finger.—It was neceſſary it ſhould be ſo long and lax, that when the fœtus in the womb grows ſtrong, it might not break it by its ſprawling and tumbling about; and that after it is born, the ſecundine, or after-birth, might be drawn out the better by it.

The way that it paſſes from the navel to the placenta, is very unconſtant; for ſometimes it goes upon the right hand, to the neck, which having incompaſſed, it deſcends to the placenta; and ſometimes it goes on the left hand, up to the neck, *&c.* Sometimes it comes not to the neck at all, but goes firſt a little up towards the breaſt, and then turns round the back, and from thence paſſes to the placenta.

This part, at the birth, is either broke, or cut away, to the navel; ſo that its veſſels, *viz.* two arteries, a vein, and urachus, become perfectly uſeleſs, as veſſels; and, drying up, become impervious, and ſerve only as ligaments to ſuſpend the liver.

Umbilical *Points*, in mathematics, the ſame with *foci.* See **Focus.**

UMBILICUS, *Navel*, in anatomy, the centre of the middle part of the lower venter, or belly; being the place through which the *umbilical* veſſels paſs, out of the fœtus, to the placenta of the mother.—See *Tab. Anat. (Splanch.) fig.* 16. *lit. e.*

* The word is pure Latin, formed of *umbo*, the little bunch in the middle of a buckler; by reaſon of its reſemblance to the navel. See **Umbilical** *Veſſels.*

Umbilicus, in mathematics, the ſame with *focus.* See **Focus.**

UMBONE, or *Horn*, among floriſts, ſignifies any pointed ſtyle, or piſtil, in the middle of a flower. See **Pistil.**

There is alſo an *umbone* called *doubly-pointed*, or *by-parted*, as in the peony; and ſometimes the *umbone* has four ſharp points, in which caſe it is termed, an *umbone* divided into ſo many heads, or cut into three or four parts.

UMBRA, *Shadow.* See the article **Light**, **Shadow**, **Penumbra**, &c.

UMBRE. See the article **Umber.**

UMBRELLA. See the article **Umbella.**

UMPIRE *, a third perſon, choſen to decide a controverſy left to an arbitration, in caſe the arbitrators cannot agree. See **Arbitrator**, and **Arbitration.**

* Minſhew ſuppoſes the word formed of the French *un pere*, a father.—Some call him a *ſur-arbitrator.*

UNCASING, among hunters, the cutting up, or fleaing of a fox. See **Hunting.**

UNCIA, a term generally uſed for the twelfth part of a thing.—In which ſenſe it occurs in Latin writers, both for a weight, called by us an *ounce*; and a meaſure, called an *inch.* See **Ounce**, and **Inch**; ſee alſo **As**, **Weight**, **Measure**, &c.

Uncia *Terræ*, or *Agri*, is a phraſe frequently met withal in the ancient charters of the Britiſh kings; but what the quantity of ground was, is a little obſcure.—All that we know for certain, is, that it ſignified a large quantity, as much as 12 modii; which modius ſome conjecture to have been an hundred feet ſquare.

UNCIÆ, in algebra, are the numbers prefixed to the letters of the members of any power, produced from a binomial, reſidual, or multinomial root. See **Root.**

Thus, in the fourth power of $a+b$, that is, $aaaa+4aaab+6aabb+4abbb+bbbb$, the *unciæ* are 4, 6, 4. See **Power**, &c.

Sir Iſaac Newton gives a rule, for finding the *unciæ* of any power ariſing from a binomial root. Thus:—Let the index of the power be called m; then will the *unciæ* ariſe from ſuch a continual multiplication as this, *viz.* $1\times\frac{m-0}{1}\times\frac{m-1}{2}\times\frac{m-2}{3}\times\frac{m-3}{4}\times\frac{m-4}{5}$, *&c.* Thus, if the *unciæ* of the biquadrate, or fourth power, were required; the rule is, $1\times\frac{4-0}{1}(=4)\times\frac{4-1}{2}(=6)\times\frac{4-2}{3}(=4)\times\frac{4-3}{1}(=1)$; which ſhews, that the *unciæ* are 1, 4, 6, 4, 1. See **Polygonal** *Number.*

Or thus: The terms of any powers are compounded of certain literal factums, with numbers called *unciæ*, prefixed; and the factums are found, by making two geometrical progreſſions; the firſt of them beginning from the required power of the firſt part of the root, and ending in unity; and the ſecond beginning with unity, and ending in the required power of the ſecond part: thus, for a ſixth power of $a+b$;

$a^6\ a^5\ a^4\ a^3\ a^2\ a^1$ firſt ſeries,
$1\ b\ b^2\ b^3\ b^4\ b^5\ b^6$ ſecond ſeries,

and multiplying the terms of the ſame order in either ſeries, into one another: as $a^6+a^5b+a^4b^2+a^3b^3+a^2b^4+ab^5+b^6$, out of which the ſixth power of $a+b$ is compounded.

The *unciæ*, then, are found by writing the exponents of the powers of the ſecond ſeries, *i. e.* of b, under the exponents of the powers of the firſt ſeries, *i. e.* of a; and taking the firſt figure of the upper ſeries for the numerator, and the firſt of the lower for the denominator of a fraction, which is equal to the *uncia* of the ſecond term; and ſo for the reſt. Thus, for the ſixth power we have,

$$\begin{matrix}6&5&4&3&2&1\\1&2&3&4&5&6\end{matrix}$$

Accordingly, $\frac{6}{1}=6$ is the *uncia* of the ſecond term of the ſixth power; $\frac{6.5}{1.2}=\frac{30}{2}=15$, the *uncia* of the third term; $\frac{6.5.4.}{1.2.3.}=\frac{120}{6}=20$, the *uncia* of the fourth term; $\frac{6.5.4.3}{1.2.3.4}=\frac{6.5}{1.2}=\frac{30}{2}=15$, the *uncia* of the fifth term; $\frac{6.5.4.3.2}{1.2.3.4.5}=\frac{6}{1}=6$, the *uncia* of the ſixth term; $\frac{6.5.4.3.2.1}{1.2.3.4.5.6}=1$, The *uncia* of the laſt power. See **Pyramidal** *Numbers.*

UNCIAL, **Uncialis**, an epithet, which antiquaries give to certain large-ſized letters, or characters, antiently uſed in inſcriptions, and epitaphs. See **Letter**, **Capital**, *&c.*

The word is formed from the Latin *uncia*, the tweſth part of any thing; and which, in geometrical meaſure, ſignified the twelfth part of a foot, *viz.* an inch; which was ſuppoſed to be the thickneſs of the ſtem of one of theſe letters—

UNCORE, or **Unques** *Priſt*, *ſtill ready*; in law, a plea for the defendant, being ſued for a debt due on a bond at a day paſt, to ſave the forfeiture of his bond, *&c.* by affirming, that he tendered the debt at the time and place, and that there was none to receive it; and that he is yet alſo ready to pay the ſame. See **Tender.**

UNCTION, **Unctio**, the act of anointing, or ſmeering with oil, or other fatty matter. See **Oil.**

Mercurial *unction*, properly applied, brings on a ſalivation. See **Salivation.**—The ſurgeons cure divers wounds, ulcers, *&c.* by repeated *unctions*, with oils, unguents, cerats, *&c.* See **Unguent**, **Liniment**, &c.

Unction, in matters of religion, is uſed for the character conferred on ſacred things, by anointing them with oil. See **Christ** and **Messia.**

Antiently, in the eaſtern countries, which abounded ſo much in oil, and odoriferous ſpices, it was the cuſtom to ſeparate perſons and things deſigned for extraordinary offices, or uſes, by anointing

ing them with ointments compoſed of ſuch ingredients; ſymbolizing thereby, both an effuſion of the neceſſary gifts to qualify them for their office, and a diffuſion of the good and grateful effects expected from them.

There were three ſorts of perſons to whom this unction, or conſecration, eſpecially belonged, kings, prieſts and prophets; who, therefore, are all of them (ſays Barrow) ſtiled in ſcripture the *Lord's Anointed*.

The *unction* of kings is ſuppoſed to be a ceremony, introduced very late among Chriſtian princes: Onuphrius ſays, none of the emperors were ever anointed before Juſtinian, or Juſtin. — The emperors of Germany took up the practice from thoſe of the eaſtern empire. — King Pepin of France was the firſt king who received the *unction*.

In the Romiſh church, beſides an *unction* at baptiſm, on the forehead, and at confirmation, on the head, they have an *extreme unction*, given to the people in the pangs of death, on the parts where the five ſenſes reſide, being the parts by which the perſon is ſuppoſed to have ſinned. See EXTREME *Unction*.

UNCUTH*, UNKNOWN, is uſed in the ancient Saxon laws, for him that comes to an inn, gueſt-wiſe, and lies there but one night. — In which caſe, his hoſt was not bound to anſwer for any offence he committed, whereof he was guiltleſs himſelf. See HOGENHINE.

* — *Prima nocte poteſt dici* uncuth, *ſecunda vero*, gueſt, *tertia nocte* hogenhine. *Bracton*, Lib. III. See THIRD *Night awn Hine*.

UNDECAGON, is a regular polygon of eleven ſides. See POLYGON.

UNDECIMVIR, a magiſtrate among the antient Athenians, who had ten other collegues, or aſſociates joined with him in the ſame commiſſion.

The functions of the *undecimviri* at Athens, were much the ſame as thoſe of the prevots de marechauſſé in France. They took care of the apprehending of criminals; ſecured them in the hands of juſtice; and when they were condemned, took them again into cuſtody, that the ſentence might be executed on them.

They were choſe by the tribes; each tribe naming its own: And as the number of tribes, after Calliſthenes, was but ten, which made ten members, a ſcribe or notary was added, which made the number eleven. — Whence their name οἱ ἑνδεκα, or *undecimviri*, as Cornelius Nepos calls them in the life of *Phocion*. — In Julius Pollux, they are denominated επαρχοι, and νομοφυλακες.

UNDE', UNDEE, or UNDY, in heraldry. See WAVY.

UNDER *the ſea* in the ſea language. — A ſhip is ſaid to be ſo, when ſhe lies ſtill, or waits for ſome other ſhips, with her helm laſhed, or tied up a-lee.

UNDER-*Currents* — Diſtinct from the *upper*, or *apparent currents* of the ſeas; ſome naturaliſts conclude, there are in divers places *under-currents*, which ſet or drive a contrary way. See CURRENT.

Dr. Smith, in the *Philoſophical Tranſactions*, brings the hypotheſis of *under-currents*, to ſolve that remarkable phænomenon, the ſea's ſetting ſtrongly through the Streights into the Mediterranean, with a conſtant current 20 leagues broad. — What ſhould become of the vaſt quantity of water poured in this way; as alſo, of that running from the Euxine, through the Boſphorus, into the Helleſpont, and thence into the Archipelago; is a ſpeculation that has long employed the philoſophers. This author's conjecture is, that there is an *under-current*, whereby as great a quantity of water is carried out as comes in. — To confirm which, he obſerves, that between the north and ſouth foreland, it is either high or low water upon the ſhore, three hours before it is ſo off at ſea: a certain ſign, that though the tide of flood runs aloft, yet the tide of ebb runs under-foot, or cloſe by the ground.

He adds an account from an able ſailor in the Baltic ſound; that going with their pinnace into the middle ſtream, they were carried violently away by the current: but that ſinking a bucket with a large cannon-bullet, to a certain depth of water, it gave a check to the boat's motion; and ſinking it ſtill lower, the boat was driven a-head to the windward, againſt the upper current, which was not above four or five fathom deep.

Dr. Halley ſolves the current's ſetting in at the Streights, without overflowing the banks, from the great evaporation; without ſuppoſing any *under-current*. See VAPOUR, and EVAPORATION.

UNDER-CHAMBERLAINS *of the exchequer*, two officers there, who cleave the tallies, and read the ſame; ſo that the clerk of the pell, and the comptrollers thereof, may ſee that the entries are true. See EXCHEQUER, TALLY, PELLS, &c.

They alſo make ſearches for all records in the treaſury, and have the cuſtody of Domeſday book. — See CHAMBERLAIN.

UNDERMINING. See the article SAPPING.

UNDER-SHERIFF, *Sub-vice-comes*. See SHERIFF.

UNDERSHRUB. See the article SUFFRUTEX.

UNDER-SITTER, an inmate. See INMATE.

UNDERSTANDING, *Intellectus*, is defined, by the Peripatetics, to be a faculty of the reaſonable ſoul, converſant about intelligible things, conſidered as intelligible. See FACULTY, and SOUL.

They alſo make it twofold, *viz. active*, and *paſſive*.

Active UNDERSTANDING, *Intellectus agens*, they hold, that faculty of the ſoul by which the ſpecies and images of intelligible things are framed, on occaſion of the preſence of phantaſms, or appearances thereof. — For, maintaining the intellect to be immaterial, they hold it impoſſible it ſhould be diſpoſed to think by any diſproportionate phantaſms of mere body, and therefore that it is obliged to frame other proportionate ſpecies of itſelf; and hence its denomination *active*.

Paſſive UNDERSTANDING, *Intellectus patiens*, is that which, receiving the ſpecies framed by the *active underſtanding*, breaks forth into actual knowledge. See KNOWLEDGE.

The moderns ſet aſide the Peripatetic notion of an *active underſtanding*. — The Carteſians define the *underſtanding* to be that faculty, whereby the mind converſing with, and, as it were, intent on itſelf, evidently knows what is true in any thing not exceeding its capacity. See JUDGMENT.

The corpuſcular philoſophers define the *underſtanding* to be a faculty, expreſſive of things which ſtrike on the external ſenſes, either by their images, or their effects, and ſo enter the mind. — Their great doctrine is, *Nihil eſſe in intellectu quod non prius fuerit in ſenſu*; and to this doctrine our famous Mr. Locke, and moſt of the lateſt Engliſh philoſophers ſubſcribe. See SENSE, *&c.*

The Carteſians cry out aloud againſt it, between whom and the Corpuſcularians there is this farther difference, that the latter make the judgment to belong to the *underſtanding*; but the former to the will. See WILL.

Hence, according to the moſt approved opinion of the Corpuſcularians, the *underſtanding* has two offices, *viz. perception*, and *judgment*; according to the Carteſians only one, viz. *perception*. See PERCEPTION.

UNDERSTANDING is alſo uſed for the act, exerciſe, or exertion of this faculty; or the action whereby the mind knows things, or repreſents them in idea to itſelf.

UNDERTAKERS, were antiently ſuch perſons as were employed by the king's purveyors, and acted as their deputies. See POURVEYORS.

At preſent, the name is chiefly uſed for *upholders*, or perſons who furniſh out funerals. — And for ſuch as *undertake* any great work, as the draining of fens, *&c.* Stat 53 Eliz.

UNDER-TREASURER *of England*, *Vice-Theſaurarius Angliæ*, an officer mentioned in the ſtat. 39 Eliz. c. 7. and whom ſeveral other ſtatutes confound with treaſurer of the Exchequer. See EXCHEQUER.

He cheſted up the king's treaſure at the end of every term, and noted the content of money in each cheſt, and ſaw it carried to the king's treaſury in the Tower, for the eaſe of the lord treaſurer, *&c.*

In the vacancy of the lord treaſurer's office, he alſo did every thing in the receipt, that the lord treaſurer himſelf does. See TREASURER.

UNDER-WOOD, *ſub-boſcus*, is coppice, or any wood that is not accounted timber. See COPPICE, and TIMBER.

UNDULATION, in phyſics, a kind of tremulous motion, or vibration, obſervable in a liquid; whereby it alternately riſes and falls, like the waves of the ſea.*. See MOTION.

* And hence it is that the term takes its riſe from the Latin, *unda*, wave. See WAVE.

This *undulatory* motion, if the liquid be ſmooth, and at reſt, is propagated in concentric circles, as moſt people have obſerved upon throwing a ſtone, or other matter upon the ſurface of a ſtagnant water, or even upon touching the ſurface of the water lightly with the finger, or the like.

The reaſon of theſe circular *undulations* is, that, by touching the ſurface with the finger, there is produced a depreſſion of the water in the place of contact. — By this depreſſion the ſubjacent parts are moved ſucceſſively out of their place, and the other adjacent parts thruſt upwards, which lying ſucceſſively on the deſcending liquid, follow it; and thus the parts of the liquid are alternately raiſed and depreſſed, and that circularly.

When a ſtone is thrown into the liquid, the reciprocal vibrations are more conſpicuous: here the water in the place of immerſion riſing higher, by means of the impulſe or rebound, till it comes to fall again, gives an impulſe to the adjoining liquid, by which means that is likewiſe raiſed about the place of the ſtone, as about a centre, and forms the firſt *undulous* circle; which falling again, gives another impulſe to the fluid next to it further from the centre, which riſes likewiſe in a circle; and thus, ſucceſſively, greater and greater circles are produced.

UNDULATORY *Motion*, is likewiſe applied to a motion in the air, whereby its parts are agitated after the like manner as waves in the ſea; as is ſuppoſed to be the caſe when the ſtring of a muſical inſtrument is ſtruck. See CHORD.

This *undulatory* motion of the air, is ſuppoſed the matter or cauſe of ſound. See SOUND.

Inſtead of the *undulatory*, ſome authors chuſe to call this a *vibratory motion*. See VIBRATION.

UNDULATION is alſo uſed, in chirurgery, for a motion enſuing in the matter contained in an abſceſs, upon ſqueezing it.— A tumor is ſaid to be in a condition for opening, when one perceives the *undulation*. See TUMOR.

UNEQUAL *Courſes.* } See the article { MASONRY.
UNEQUAL *Hours.* } { HOUR.

UNEVEN *Number*. See the article NUMBER.

UNGELD*, in our ancient cuſtoms, a perſon out of the protection of the law; ſo that if he were murdered, no *geld*, or fine, was to be paid in the way of compenſation by him that killed him. See WERE.

* The word is compounded of the negative *un*, and *gildan*, to pay. See GELD, and ÆSTIMATIO *Capitis*.

Si Frithman, i. e. *homo pacis*, *fugiet & repugnet*, *& ſe nolit indicare*; *ſi occidatur jaceat*, ungeld, *i. e.* no pecuniary compenſation ſhall be made for his death. *Skinner*.— *Ungilda akere*, mentioned in Brompton, has much the ſame ſignification, *viz.* where any man was killed, attempting any felony, he was to lie in the field unburied, and no pecuniary compenſation to be made for his death.

UNGUENT, UNGUENTUM, *Ointment*, in chirurgery, a topical remedy, or compoſition, chiefly uſed in the dreſſing of wounds and ulcers. See WOUND, *&c.*

Unguents, liniments, and cerats, are external forms applied on divers parts of the body, both to cure, and to eaſe and relieve them.— They only differ from each other in conſiſtence; with regard to which, *unguents* hold the medium; being ſtiffer than liniments, but ſofter than cerats. See LINIMENT, and CERAT.

Oils are ordinarily the baſes of all three; to which are added wax, axungia, and ſeveral parts of plants, animals, and minerals; both on account of the virtues they furniſh, and to give a conſiſtence to the oils, and to keep them longer on the part, that they may have more time to act.

The principal *unguents*, or ointments, are *unguentum roſatum*; *unguentum album*, or *white unguent* of cerus; *populneum*, made of the buds of the poplar tree; *unguentum apoſtolorum*, ſo called from the twelve drugs it conſiſts of, a cleanſer; *unguentum baſilicum*, a ſuppurative; *unguentum Ægyptiacum*, cauſtic; *unguentum aureum*, incarnative, and cicatrizing; *unguentum de apio*, mundificative; *unguentum Agrippæ*, ſaid to be diſcovered by king Agrippa. See POPULNEUM, ÆGYPTIACUM, APOSTOLORUM, *&c.*— Pomatums are alſo ranked in the number of *unguents*. See POMATUM.

UNGUIS, a Latin term, ſignifying a *nail* of the hand or foot. See NAIL.

UNGUIS (in Medicine) a diſeaſe of the eye; being a whitiſh ſpeck on the adnata, formed of a nervous excreſcence growing on that coat; beginning at the great canthus, ſomewhat of the ſhape and ſize of a nail of the hand, and ſpreading inſenſibly till it reach the pupil, and at laſt quite cover it.

The *unguis* is much of the ſame nature with the *pterygium* and *pannus*. See PANNUS.

The ordinary cauſe of the *unguis* is an exceſſive acrimony in the tears, which corrode the conjunctiva; as is often the caſe in an ophthalmia, or after the ſmall-pox. See OPHTHALMIA.

UNGUIS, in anatomy, is applied to two bones of the noſe, being as thin as ſcales, and reſembling the nail; whence their name. See NOSE.

The *ungues* are the ſmalleſt bones in the upper jaw, and are ſituate cloſe to the great canthus of the eye. See MAXILLA.

Some authors call them *oſſa lachrymalia*, but improperly; there being no glandula lachrymalis in the canthus.— Others call them *orbitaria oſſa*.

They are contiguous to four other bones, *viz.* the coronal, that of the noſe, the maxillary, and that part of the ethmoides which forms the orbit.

UNGUIS, or UNGUICULUS, among botaniſts and floriſts, denotes a little ſpeck, of a different colour from the reſt of the petala, or leaves of flowers. See PETALA.

It has the figure of a nail of the hand: its place is at the origin, or root of thoſe leaves; as we ſee in the roſe, poppy-flowers, and divers others.

In preparing of medicines, the *ungues*, or *unguiculi*, are pulled off the flowers that enter the ſame.

UNGUIS *Odoratus*. BLATTA *Bizantia*.

UNGULA, in geometry, is the ſection of a cylinder, cut off by a plane paſſing obliquely through the plane of the baſe, and part of the cylindric ſurface. See CYLINDER, *&c.*

UNGULA, in natural hiſtory, the claw, or hoof of a quadruped. See HOOF.

UNGULA *Alcis*, the elk's claw. See the article ELK.

UNGULA, or *Hamus*, among ſurgeons, a ſort of hooked inſtrument, wherewithal to extract a dead fœtus out of the womb.

UNICORN, in natural hiſtory, an animal famous among the Greek authors, under the name of *μονοκερως*; and among the Latins, under that of *unicornu*.

Both theſe names it takes from its diſtinguiſhing characteriſtic, the having one horn only; which is repreſented as five palms long, growing in the middle of the forehead. See HORN.

This animal claims a place here, not only as it makes a curious article in natural hiſtory, but alſo as it furniſhes ſomething to medicine, commerce, and heraldry.

The popular account is, that it is about the ſize of a horſe, its hair ſhort, and of a dark-brown colour; very timerous, and therefore keeping moſtly in the woods; and that its true place is the province of Agoas, in the kingdom of Damotes, in Ethiopia.

The firſt author who wrote of the *unicorn*, was one Creſius, whom Ariſtotle mentions as a very ſuſpicious author: Ælian only ſpeaks of it in very doubtful terms.— The other writers on the ſubject are Philoſtratus, and Solinus; Æneas Sylvius, who is pope Pius II. Marcus Paulus, Aleoſius, Geſner, Garcias ab Horto, And. Marinus, *&c.* Of theſe, ſome ſay it reſembles a horſe, others an aſs, others a goat, by its beard; others an elephant, others a rhinoceros, others a greyhound, *&c.*

Munſter and Thevet will have it an amphibious animal, and its horn to be moveable at pleaſure.— Others make all its ſtrength to conſiſt in its horn; and add, that when purſued by the hunters, it precipitates itſelf from the tops of the higheſt rocks, and pitches upon its horn; which ſuſtains the whole effort of its fall, ſo that it receives no damage thereby.— In effect, the ſeveral authors do all give ſeveral accounts of the figure and colour, both of the animal, and of its horn, and all its parts.— And hence the more knowing among the moderns, do unanimouſly hold it a fabulous animal.

The legend adds, that it is wonderful fond of chaſte perſons; and therefore, in order to take it, a virgin is placed in its way; whom when the *unicorn* ſpies, he lies down by her, and lays his head on her lap, and ſo falls aſleep; upon which the virgin making a ſignal, the hunters come in, and take the beaſt; which could never be caught any other way, becauſe it would either caſt itſelf headlong from a rock, or die.

What ordinarily paſſes among us for *unicorn's horn*, and is ſhewn for ſuch in the collections of curioſities, and uſed for ſuch by ſeveral phyſicians, we are aſſured by Pereyra, in his account of Greenland, is the tooth of a large fiſh of the whale kind, called by the iſlanders *narwal*; and, in other places, *walrus*, and *rohart*; frequent enough in the icy ſea.

This tooth, or horn, turned, channelled, and terminating in a point, as it is, ſprings out of the middle of the fore-part of the upper jaw, where it has a root a foot long, as thick as the horn itſelf: it is the only tooth the animal has in the upper jaw, and ſerves it as a weapon of defence, wherewith it dares to attack the largeſt whale.*— It can ſtrike it with ſuch violence, as even to pierce the ſide of a ſtrong-built ſhip.

* The horn of the Narwal caught in 1736 in a creek of the Elbe, in the dutchy of Bremen, aroſe, as Dr. Hampe aſſures us, from the fore-part of the head, juſt above the mouth, and was ſix foot long, white like ivory, and curiouſly twiſted.— Yet Wormius, and the generality of authors, take it for a tooth. Many hold its chief uſe is to break the ice. Dr. Steigartahl rather imagines it to ſerve for ſeeking its food; and mentions a whale caught in Greenland, in the belly of which a Narwal had ſtuck his tooth up to the mouth, and had ſuck'd the blood and humours. Vid. *Phil. Tranſ.* Numb. 447. p. 147, & p. 149. ſeq.

There is a fine horn of this kind preſerved in the repoſitory of S. Denis at Paris, given by And. Thevet, and pretended to have been a preſent to him from the king of Monomotapa, who carried him to hunt the *unicorn*; which is frequent in that country: this horn ſome have ſuſpected to be an elephant's tooth, carved in that manner.— At Straſbourg there is another, between ſeven and eight feet long.— In the repoſitory at Venice, there is a good number; all different from each other.

The antients held the *unicorn's horn* to be a counter-poiſon; and, that the animal uſed to dip it in the water, to purify and ſweeten it ere it would drink: it is added, that for the ſame reaſon other beaſts wait to ſee it drink before them.— Thence, as alſo from the rarity of the thing, people have taken occaſion to attribute divers medicinal virtues thereto.

But Amb. Paré has proved it a mere piece of charletanery, and all the virtues attributed to it to be falſe; and yet the price it has bore is almoſt incredible: Andrea Racci, a phyſician of Florence, affirms the pound of 16 ounces to have been ſold, in the apothecaries ſhops, for 1536 crowns, when the ſame weight of gold was only worth one hundred forty eight crowns.

The *unicorn* is one of the ſupporters of the arms of England. See SUPPORTER.— This beaſt is repreſented, by heralds, paſſant, and ſometimes rampant.— When in this laſt action, as in the Engliſh arms, it is properly ſaid to be *ſaillant*.— Argent, an *unicorn* ſeiant ſable, armed and unguled, or, borne by the name of *Harding*.

UNIFORM, UNIFORMIS, denotes a thing to be ſimilar, or conſiſtent either with another thing, or itſelf, in reſpect of figure, ſtructure, proportion, and the like.— In which ſenſe it ſtands oppoſed to *difform*. See SIMILITUDE.

UNIFORM, or *Equable Motion*. See the article MOTION.

UNIFORM *Flowers of plants*, are ſuch as are of the ſame figure all around, having their fore and back parts, as alſo their right and left parts, exactly alike. See FLOWER.

When they are otherwiſe, they are termed *difform flowers.* See DIFFORM.

UNIFORM *Temperament.* See the article TEMPERAMENT.

UNIFORMITY, *Regularity*, a ſimilitude or reſemblance between the parts of a whole.— Such is that we meet withal in figures of many ſides, and angles reſpectively equal, and anſwerable to each other. See REGULAR.

A late ingenious author makes beauty to conſiſt in *uniformity*, joined or combined with variety. See BEAUTY.

Where the *uniformity* is equal in two objects, the beauty, he contends, is as the variety; and where the variety is equal, the beauty is as the *uniformity.* See DEFORMITY.

UNIFORMITY, is particularly uſed for one and the ſame form of public prayers, and adminiſtration of ſacraments, and other rites, *&c.* of the church of England, preſcribed by the famous ſtat. 1 Eliz. and 14 Car. II. called *the Act of uniformity*, See NONCONFORMIST, DISSENTER, SEPARATIST, *&c.*

UNION, a junction, coalition, or aſſemblage of ſeveral different things in one.— Philoſophers are exceedingly to ſeek about the manner of the *union* of ſoul and body, or by what medium it is that two ſuch heterogeneous beings are kept ſo cloſely together? — It is one of the great laws of this *union*, that ſuch and ſuch an impreſſion on the brain be followed by ſuch and ſuch a ſenſation, or perception in the ſoul. See SOUL, SENSATION, MOTION, *&c.*

UNION, in a philoſophical ſenſe, is uſed, by Dr. Grew, for one of the three ways of mixture; being the joining together of atoms, or inſenſible particles, ſo as to touch in a plane: as is ſuppoſed to be the caſe in the cryſtallizations of ſalts, and the like bodies. See MIXTION, CRYSTALLIZATION, *&c.*

UNION, among painters, expreſſes a ſymmetry and agreement between the ſeveral parts of a painting; when, *e. gr.* there is a deal of relation and connection between them, both as to the figures, and the colouring: ſo that they apparently conſpire to form one thing. See SYMMETRY.

UNION, in architecture, may denote a harmony between the colours in the materials of a building.

UNION, in an eccleſiaſtical ſenſe, denotes a combining or conſolidating of two churches into one. See CHURCH, BENEFICE, CONSOLIDATION, *&c.*

This is not done without the conſent both of the biſhop, the patron, and the incumbent. See PATRON, *&c.*

The canoniſts diſtinguiſh three kinds of *union:* that of *acceſſion*, that of *confeſſion*, and that of *equality*.

UNION *of Acceſſion*, is the moſt uſual: by this the united benefice becomes a member, and acceſſory of the principal.

UNION *by Confuſion*, is that where the two titles are ſuppreſſed, and a new one created, including both.

UNION *of Equality*, is that where the two titles ſubſiſt; but equal, and independent.

By ſtat. 37 Hen. VIII. it is enacted, "That an *union*, or "conſolidation of two churches may be admitted, provided "the annual value of one of them, in the king's books, do "not exceed 6 *l.* and the diſtance between them, be not a"bove one mile."— And by another ſtat. 17 Car. II. it is enacted, "That the *union* of two churches, or chapels, in "any city or town, by the biſhop, patron, and chief Magi"ſtrate of the town, ſhall be valid, unleſs the value of the "churches ſo united exceed 100 *l.*"

Hypoſtatical **UNION**. See the article HYPOSTATICAL.

UNION, or *the* **UNION**, by way of eminence, is more particularly uſed, among us, to expreſs the act whereby the two ſeparate kingdoms of England and Scotland were incorporated into one, under the title of *the kingdom of Great Britain.*

The *happy union*, in vain attempted by king James I. was at length effected in the year 1707, by the general conſent of the queen, and the eſtates of each realm.

The act, or treaty of *union*, conſiſts of twenty-five articles; which eleven Engliſh commiſſioners, and eleven Scotch ones, examined, approved, and ſigned on the third of Auguſt 1706. — The parliament of Scotland approved it on the fourth of February, 1707; and the parliament of England, the tenth of March, in the ſame year.— On the 17th following, the queen went to parliament, where ſhe approved the ſame treaty, with the act of ratification.

Since that time, there is only one privy council, and one parliament for the two kingdoms: the Scotiſh parliament is ſuppreſſed, or, rather ſuper-added to the Engliſh; both of them only conſtituting one, under the title of *the parliament of Great Britain.*

The number of members which, by the articles of the *union*, the Scots are to ſend into the houſe of commons, to repreſent the commons of that country, are 45; and the number of peers, whereby their peerage is to be repreſented, is 16. See PARLIAMENT.

The great officers of the crown of Scotland, before the *union*, were the lord high chancellor, lord high theſaurer, or treaſurer, lord privy-ſeal, and lord regiſter.—The leſſer officers of ſtate were, the lord regiſter, lord advocate, lord theſaurer depute, and lord juſtice-clerk.

The four firſt officers are diſſolved by the *union*, and inſtead thereof new officers are erected, ſerving for both countries under the title of *lord high chancellor of Great Britain*, &c. See CHANCELLOR, TREASURER, *&c.*—The four latter officers ſtill ſubſiſt. See ADVOCATE, REGISTER, *&c.*

UNIONS, **UNIONES**, in phyſiology, the ſame with *margaritæ*, or *pearls*. See PEARL.

UNISON, in muſic, is the effect of two ſounds, which are equal in degree of tune, or in point of gravity, and acuteneſs. See TUNE.

Uniſon may be defined a conſonance of two ſounds, produced by two ſtrings, or other bodies of the ſame matter, length, thickneſs, and tenſion, equally ſtruck, and at the ſame time; ſo that they yield the ſame tone, or note. See NOTE.

Or, it is the *union* of two ſounds, ſo like each other, that the ear perceiving no difference, receives them as one and the ſame ſound. See SOUND.

What conſtitues *uniſonance*, is the equality of the number of vibrations of the two ſonorous bodies in equal times: where there is an inequality in that reſpect; and, of conſequence, an inequality in degree of tune, the unequal ſounds conſtitute an *interval.* See INTERVAL, and VIBRATION.

Uniſon is the firſt and greateſt of concords; and the foundation, or, as ſome call it, the *mother* of all the reſt: yet others deny it to be any concord at all, maintaining it to be only that in ſounds which unity is in numbers. See UNITY.

Theſe reſtrain the word *concord* to intervals, and make it include a difference of tune; but this is precarious: for as the word *concord* ſignifies an agreement of ſounds, it is certainly applicable to *uniſons* in the firſt degree.

But though *uniſonance*, or an equality of tune, makes the moſt perfect agreement of ſound; it is not true that the nearer any two ſounds come to an equality of tune, they are the more agreeable.— The mind is delighted with variety; and the reaſon of the agreeableneſs, or diſagreeableneſs of two ſounds, muſt be aſcribed to ſome other cauſe than the equality, or inequality of the number of their vibrations. See CONCORD.

It is a famed phænomenon in muſic, that an intenſe ſound being raiſed, either with the voice, or a ſonorous body, another ſonorous body near it, whoſe tune is either *uniſon*, or octave to that ſound, will ſound its proper note *uniſon*, or octave, to the given note.— The experiment is eaſily tried by the ſtrings of two inſtruments; or by a voice, and a harpſichord; or a bell, or even a drinking-glaſs.

This our philoſophers account for thus: one ſtring being ſtruck, and the air put in motion thereby, every other ſtring within the reach of that motion, will receive ſome impreſſion therefrom: but each ſtring can only move with a determinate velocity of recourſes, or vibrations; and all *uniſons* proceed from equal, or equidiurnal vibrations; and other concords from other proportions.— The *uniſon* ſtring, then, keeping equal pace with the ſounded ſtring, as having the ſame meaſure of vibrations, muſt have its motion continued, and ſtill improved, till its motion become ſenſible, and it give a diſtinct ſound. Other concording ſtrings have their motions propagated in different degrees, according to the frequency of the coincidence of their vibrations, with thoſe of the ſounded ſtring: the octave, therefore, moſt ſenſibly; then the fifth: after which, the croſſing of the motions prevents any effect.

This they illuſtrate by the pendulum; which being ſet a moving, the motion may be continued and augmented, by making frequent, light, coincident impulſes; as blowing on it when the vibration is juſt finiſhed: but if it be touched by any croſs or oppoſite motion, and this, too, frequently; the motion will be interrupted, and ceaſe altogether.— So, of two *uniſon* ſtrings, if the one be forcibly ſtruck, it communicates motion, by the air, to the other: and being equidiurnal in their vibrations, that is, finiſhing them preciſely together, the motion of that other will be improved and heightened, by the frequent impulſes received from the vibrations of the firſt; becauſe given preciſely, when that other has finiſhed its vibration, and is ready to return: but if the vibrations of the chords be unequal in duration, there will be a croſſing of motions, leſs or more, according to the proportion of the inequality; by which the motion of the untouched ſtring will be ſo checked, as never to be ſenſible. And this we find is the caſe in all conſonances, except *uniſon*, octave, and the fifth. See CHORD.

UNIT, **UNITE**, or **UNITY**, in arithmetic, the number *one*; or one ſingle individual part of diſcrete quantity. See NUMBER.

If a number conſiſt of four or five places, that which is outermoſt towards the right hand, is called the place of *units.* See NUMERATION.

Number, in general, is by Euclid defined to be μοναδων ϖοσοτης, a multitude, or aggregate of *units*; in which ſenſe, *unity* is not a number. See UNITY.

UNITARIANS, a name aſſumed by the new Antitrinitarians; as making profeſſion to preſerve the glory and attribute of divinity to the *one*, only great and ſupreme God, and Father of our Lord Jeſus Chriſt. See ARIANS, SOCINIANS, &c.

UNITED *Affection.* See the article AFFECTION.

UNITY, UNITAS, the abſtract, or quality, which conſtitutes, or denominates a thing *unum*, or one. See UNIT.

The ſchool philoſophers generally define *unity*, by a thing's being undivided in itſelf, and divided from every thing elſe. —Others, more accurately, define it, a mode of being, whereby it agrees to any particular being, once: theſe make two kinds of *unity*, viz. *unity of ſimplicity*, which is both undivided and indiviſible; ſuch as that of God, angels, and human ſouls: the other, *union of compoſition*, which, though undivided, is diviſible in the being, as conſiſting of divers parts: ſuch is that of man, *&c.*

Hence, *unity* is alſo divided into that *per ſe*, which agrees to any being whoſe parts are collected into one ſubſtratum; and *unity per accidens*, whoſe parts are not united into one ſubſtratum; as that of a flock of ſheep, *&c.*

Some alſo make a *ſingular*, or *numerical unity*, and an *univerſal unity*; a *real*, and an *imaginary unity*, &c.

It is diſputed among mathematicians, whether or no *unity* be a number? — The generality of authors hold the negative, and make *unity* to be only inceptive of number, or the principle thereof; as a point is of magnitude, and *uniſon* of concord.

Stevinus is very angry with the maintainers of this opinion: and yet, if number be defined a multitude of units joined together, as many authors define it, it is evident *unity* is not a number. See NUMBER.

UNITY, among divines. — The Romaniſts, and the Reformed diſpute, whether or no the church be one ſingle body, all the members whereof are joined together, either really, or in inclination; ſo that whatever does not appertain to that body, is not part of the church: which is what they call *the unity of the church*; and which the Romaniſts maintain is reſtrained to one ſingle ſociety, or one communion, under one viſible head; and out of which the Proteſtants are excluded!

Theſe laſt, on the contrary, hold, that the *unity* of the church may ſtill ſubſiſt, without the members being united under any one viſible head; it being ſufficient, that all Chriſtians be united by the bonds of mutual love, and charity; and that they be agreed in the fundamental points of religion.

All the difficulty is, to fix what thoſe fundamentals are; ſome inclining to make the door of the church wider that others. See TOLERATION.

UNITY, in poetry. — In the drama there are three *unities* to be obſerved; the *unity of action*, that of *time*, and that of *place*. See DRAMA.

In the epic poem, the great, and almoſt only *unity*, is that of the action. — Some regard, indeed, ought to be had to that of time: that of place there is no room for. — The *unity* of character is not reckoned among the *unities*. See CHARACTER.

The *unity* of the dramatic action, conſiſts in the unity of the intrigue in comedy, and that of the danger in tragedy; and this not only in the plan of the fable, but alſo in the fable extended and filled with epiſodes. See ACTION.

The epiſodes are to be worked in, without corrupting the *unity*, or forming a double action; and the ſeveral members are to be ſo connected together, as to be conſiſtent with that continuity of action ſo neceſſary to the body; and which Horace preſcribes, when he ſays, — *Sit quodvis ſimplex duntaxat & unum.* See EPISODE.

The *unity* of the epic action, M. Dacier obſerves, does not conſiſt in the unity of the hero, or in the unity of his character, and manners; though thoſe be circumſtances neceſſary thereto. — The *unity of action*, requires that there be but one principal action, of which all the reſt are to be incidents, or dependencies. See HERO, MANNERS, &c.

F. Boſſu aſſigns three things requiſite thereto: the firſt, that no epiſode be uſed, but what is fetched from the plan, and ground of the action, and which is a natural member of that body: the ſecond, that theſe epiſodes and members be well connected with each other: The third is, not to finiſh any epiſode, ſo as it may appear a whole action; but to let each be always ſeen in its quality of member of the body, and an unfiniſhed part.

The ſame excellent critic examines the *Æneid*, *Iliad*, and *Odyſſee*, with reſpect to theſe rules, and finds them ſtrictly obſerved. — Indeed, it was from the conduct of thoſe divine poems, that he took the hint of the rules themſelves. Inſtances wherein theſe rules are all neglected, he gives us in Statius's *Thebaid*.

To the *unity of time* it is required, in the drama, that the action be included in the ſpace of a day. — Ariſtotle ſays expreſly, it muſt not exceed the time the ſun employs in making one revolution, which is a natural day, under pain of irregularity: ſome critics will even have it included in the ſpace of twelve hours, or an artificial day.

Indeed, the antient tragic poets ſometimes diſpenſed with this rule; and the modern Engliſh ones many of them diſallow it: few of them practiſe it.

In the epic poem, the *unity of time* is ſtill leſs eſtabliſhed: In effect, there is no fixing the time of its duration; in regard, the warmer and more violent the action is, the leſs muſt be it continuance: Whence it is, that the *Iliad*, repreſenting the anger of Achilles, only contains forty-ſeven days at moſt; whereas the action of the *Odyſſee* holds eight years and an half, and that of the *Æneid* almoſt ſeven years.

But the length of the poem Ariſtotle gives us a rule for; which is, that it be ſuch as it may be read over in one day: pretending, that if it exceeds that compaſs, the ſight will be bewildered in it, and that one cannot ſee the end, without having loſt the idea of the beginning.

As to the *unity of place* and *ſcene*, neither Horace nor Ariſtotle give us any rules relating thereto. — It were to be wiſhed, indeed, that what is preſented to the audience on the ſame ſtage, which is never ſhifted, might be ſuppoſed to have paſſed in the ſame houſe, and the ſame apartment. — But as ſuch a conſtraint would cramp the poet too much; and as ſuch an uniformity would ſuit very ill with abundance of ſubjects; it has been agreed, that what paſſes any where in the ſame town or city, ſhall be allowed for *unity of place*. — At leaſt, if two different places be unavoidable; yet the place is never to be changed in the ſame act. See SCENE.

UNITY *of poſſeſſion*, in law, ſignifies a joint poſſeſſion of two rights, by ſeveral titles. See POSSESSION.

Thus, if I take a leaſe of land upon a certain rent, and afterwards buy the fee ſimple; this is an *unity of poſſeſſion*, whereby the leaſe is extinguiſhed: by reaſon I, who before had only the occupation for my rent, am now become lord of the ſame, and am to pay rent to none but myſelf. See EXTINGUISHMENT.

Unity of poſſeſſion, amounts to the ſame with what civilians call *conſolidation*. See CONSOLIDATION.

UNIVERSAL*, ſomething that is common to many things: or it is one thing belonging to many, or all things. See GENERAL, CATHOLIC, &c.

* The word, according to ſome, is compounded of *unum verſus alia*.

There are *univerſal inſtruments*, for meaſuring all kinds of diſtances, as heighths, lengths, *&c.* called alſo *pantometers*, and *holometers*.

An *univerſal* dial, is that whereby the hour may be found by the ſun all over the earth; or under any elevation of the pole. See DIAL.

Several learned authors have had it in view, to eſtabliſh an *univerſal character*; by which the different nations might underſtand each other's writings, without learning their language. See CHARACTER.

The Romaniſts are divided among themſelves, about the title of *univerſal biſhop*, which the popes have arrogated to themſelves; though others of them have declined it. — Baronius holds the appellation to belong to the pope jure divino; and yet S. Gregory, oppoſing the ſame quality given by a council in 586, to John, patriarch of Conſtantinople, aſſerted expreſly, that it did not belong to any biſhop; and that the biſhops of Rome could not, nor ought not to take it. — Accordingly, S. Leo refuſed to accept it, when offered him by the council of Chalcedon; for fear, leſt giving ſomething particular to one biſhop, they ſhould take from all; ſince there could not be an *univerſal biſhop*, but the authority of the reſt muſt be diminiſhed. See BISHOP, OECUMENICAL, POPE, &c.

UNIVERSAL, UNIVERSALE, in logic, is either *complex*, or *incomplex*. — A *complex univerſal*, is either an univerſal propoſition, as, "Every whole is greater than its part;" or whatever raiſes a manifold conception in the mind; as the definition of a reaſonable animal.

An *incomplex univerſal*, is what produces one only conception in the mind, and is a ſimple thing, reſpecting many; as human nature, which relates to every individual wherein it is found.

According to the various order and reſpect this *univerſal* has to many, there are ſeven modes thereof aſſigned; *viz.*

Univerſals in cauſing, ſuch are the common efficient cauſes of divers effects; as *God*, the *ſun*, &c. See CAUSE, &c. — *Univerſals in diſtributing*, ſuch are common, or univerſal ſigns; as *all*, *none*, &c. — *Univerſals in knowing*, which know all things; as the underſtanding, *&c.* — *Univerſals in repreſenting*, ſuch are images, or ideas of univerſal things; as the idea of a houſe, of a man, *&c.* — *Univerſals in ſignifying*, ſuch are common words, ſignifying many things; as animal, ſtone, *&c.* — *Univerſals in being*, or *exiſting*, are natures exiſting in ſeveral; as humanity in Peter, Paul, *&c.* — And, *Univerſals in predicating*, which exiſt in many things, and are ſeparately predicated of them all; as, *ens*, and *unum*: theſe are alſo called *logical univerſals*.

All theſe kinds of *univerſals*, the two laſt only excepted, are not *univerſals* in themſelves, but only with reſpect to their objects, *cauſed*, *repreſented*, &c. So that what we chiefly conſider as *univerſals*, are the *univerſalia in eſſendo*, and *prædicando*.

Now in an *univerſal*, they diſtinguiſhed two things, the *matter*, called the *material univerſal*, *univerſale materiale*, which is the one nature multipliable in many; as humanity in Peter,

ter, Paul, &c. and the *form*, called the *formal univerſal*, which is the unity of that nature.

Wherefore to conſtitute an *univerſal*, it is requiſite the nature be one, yet multipliable: but what ſuch a nature is, has proved matter of great controverſy, both among the antient and modern philoſophers.

The Platoniſts will have *univerſals* to be nothing but divine ideas— Now by *idea* they mean the pattern or form which the artificer has in view, when he makes any thing: but as this is two-fold, *internal*, which is a ſort of image of the thing to be done, which the artificer frames in himſelf; and *external*, which is ſomething out of himſelf, which the artificer imitates: the philoſophers have been infinitely perplexed, to find which of the two Plato meant.— The Peripatetics inſiſt he meant the *external*; but the Platoniſts, and moſt of the Chriſtian divines, hold for the *internal*.

The Stoics and Nominaliſts hold this in common with the Platoniſts, that *univerſals* are not in the things themſelves, but out of them: The Stoics, particularly, for *univerſals*, put a kind of formal conceptions, or acts of knowing; by reaſon they repreſent many things at the ſame time: *e. gr.* knowledge, repreſenting all men, is, according to the Stoics, an *univerſal*.

The Nominaliſts make words *univerſals*; by reaſon the ſame word repreſents many things, as the word *man* repreſents all men: but both Stoics and Nominaliſts make *univerſals* to be ſomething extrinſic to things themſelves; by reaſon whatever exiſts, or is produced, is ſingular: ſo that there is no *univerſal* really in things.

The Peripatetics, however, contend, that there are *univerſal* and *common* natures in things themſelves; or that things and natures like each other, form a material *univerſal*.— But as to the manner wherein they are *univerſal*, or whence they derive their *univerſality*, that is, their unity and aptitude of being in many, whether from nature, or from our underſtanding, is matter of diſpute among them.— If they derive that unity, wherein their *univerſal* form is placed, from nature; then there is an *univerſal à parte rei*; which is the opinion of the Scotiſts. See SCOTISTS.

If they do not derive it from nature, but only from our minds or underſtandings, then the doctrine of the Thomiſts is allowed; who contend, that a formal *univerſal* has no other exiſtence, but by an act of the intellect. See THOMISTS.

UNIVERSAL *Cauſe*.		CAUSE.
UNIVERSAL *Characters*.		CHARACTER.

UNIVERSAL *Rheumatiſm*.		RHEUMATISM.
UNIVERSAL *Ring-dial*.		RING-*Dial*.
UNIVERSAL *Syſtem*.		SYSTEM.
UNIVERSAL *Theorem*.		THEOREM.

UNIVERSALISTS, in polemical divinity, an appellation, given to ſuch as hold *univerſal* grace; in like manas the domination *particulariſts*, is given to thoſe who hold *particular* and *efficacious* grace. See GRACE, EFFICACIOUS, PARTICULARIST, &c.

The Arminians are particularly denominated *univerſaliſts*. See ARMINIAN.

UNIVERSALITY, the quality that denominates a thing *univerſal*. See UNIVERSAL.

The Catholics aſſert the *univerſality* of their church, both as to time, and perſons; and maintain this to be a note or mark of the true church; which diſtinguiſhes it from all other ſocieties that pretend to the name. See UNIVERSAL, CHURCH, &c.

UNIVERSALITY, in the ſchools.— Logicians make two kinds of *univerſality*; the one *metaphyſical*, the other *moral*.

Metaphyſical UNIVERSALITY, is that which excepts nothing: as this propoſition, "Every man is mortal."

Moral UNIVERSALITY, is that which admits of ſome exception: as, "All old men praiſe the times paſt."— In ſuch like propoſitions, it is enough the thing be ordinarily ſo; it not being ſtrictly required, that every old man ſhould be of that diſpoſition.

UNIVERSE, a collective name, ſignifying the whole world, or the aſſemblage of heaven and earth, with all things therein: called by the Greeks, το παν, and by the Latins, *mundus*. See WORLD, HEAVEN, EARTH, SYSTEM, &c.

The antients, and after them the Carteſians, imagine the *univerſe* to be infinite.— The reaſon they give, is, that it implies a contradiction to ſuppoſe it finite, or bounded; ſince it is impoſſible not to conceive ſpace beyond any limits that can be aſſigned it: which ſpace, according to the Carteſians, is body; and conſequently part of the *univerſe*. See SPACE, and EXTENSION.

But that the *univerſe* is finite, appears from the two following conſiderations.— 1ſt, That whatever conſiſts of parts, cannot be infinite; ſince the parts that compoſe it, muſt be finite, either in number or magnitude; which if they be, what they compoſe muſt be ſo too; or, 2dly, they muſt be infinite in number or magnitude; but an infinite number is a contradiction, and to ſuppoſe the parts infinitely big, is to ſuppoſe ſeveral infinites, one bigger than another; which, though it may paſs among mathematicians, who only argue about infinites, *in poſſe*, or in imagination, will not be allowed in philoſophy. See INFINITE.

UNIVERSITY, UNIVERSITAS, a collective term, applied to an aſſemblage of ſeveral colleges eſtabliſhed in a city, or town, wherein are profeſſors in the ſeveral ſciences, appointed to teach them to ſtudents; and where degrees, or certificates of ſtudy in the divers faculties are taken up. See ART, and SCIENCE.

In each *univerſity* four faculties are uſually taught; theology, medicine, law, and the arts and ſciences. See THEOLOGY, &c.

They are called *univerſities*, or *univerſal ſchools*, by reaſon the four faculties are ſuppoſed to make the world, or whole compaſs of ſtudy. See FACULTY.

In the eye of the law, an *univerſity* is held a mere lay body, or community; though, in reality, it be a mixed body, compoſed partly of laymen, and partly of eccleſiaſtics. See COMMUNITY, COMPANY, &c.

Univerſities had their firſt riſe in the twelfth and thirteenth centuries.— Thoſe of Paris and Bologna pretend to be the firſt that were ſet on foot; but then they were on a different footing from the *univerſities* among us. See SEMINARY, and SCHOOL

The *univerſity* of Paris is ſaid to have commenced under Charlemaign, and to owe its riſe to four Engliſhmen, diſciples of venerable Bede; who, going to that city, made a propoſal to ſet up, and ſell learning; and accordingly, held their firſt lectures in places aſſigned them by that prince: ſuch is the account given by Gaguin, Gilles, de Beauvais, &c.— Though the authors who wrote in thoſe days, as Eginhard, Aimon, Rheginon, Sigebert, &c. make not the leaſt mention thereof.

Add, that Paſquier, Du Tillet, &c. declare openly againſt the opinion; and aſſert, that its firſt foundations were not laid till Louis the young, and Philip Auguſte, in the twelfth century.— The earlieſt mention we find made of it, is in Regordus, who lived in that age; and who was cotemporary with Peter Lombard, the maſter of the ſentences, the great glory of that *univerſity*; in memory of whom, an anniverſary is to this day obſerved by that body, in the church of S. Marcel, where he lies buried.

But it is certain it was not eſtabliſhed all at once: it appears to have been at firſt no other than a public ſchool in the cathedral church; from which it grew, by little and little, under the favour and protection of the kings, into a regular body.

In effect, our own *univerſities*, Oxford and Cambridge, ſeem intitled to the greateſt antiquity of any in the world; and Univerſity, Baliol, and Merton colleges in Oxford, and S. Peter's in Cambridge, all made colleges in the thirteenth century, may be ſaid to be the firſt regular endowments of this kind in Europe.

For though Univerſity college in Cambridge had been a place for ſtudents ever ſince the year 872, yet this, like many of the other antient colleges beyond ſea, and Leyden to this day, was no proper college; but the ſtudents, without any diſtinction of habit, lived in citizens houſes; having only meeting-places to hear lectures, and diſpute.

In after-times, there were houſes built for the ſtudents to live in ſociety; only each to be at his own charge, as in the inns of court.— Theſe, at firſt, were called *inns*; but now *halls*. See INN, and HALL.

At laſt, plentiful revenues were ſettled on ſeveral of theſe halls, to maintain the ſtudents in diet, apparel, &c. and theſe were called *colleges*. See COLLEGE.

The *univerſities* of Oxford and Cambridge are governed next under the king, by a *chancellor*, who is to take care of the government of the whole *univerſity*, to maintain the liberties thereof, &c. See CHANCELLOR.

Under him is the *high ſteward*, whoſe office is to aſſiſt the chancellor, and other officers, when required, in the execution of their offices, and to hear and determine capital cauſes, according to the laws of the land, and the privileges of the *univerſity*.

The next officer is the *vice-chancellor*, who officiates for the chancellor in his abſcence.— There are alſo two *proctors*, who aſſiſt in the government of the *univerſity*; particularly in the buſineſs of ſchool-exerciſe, taking up degrees, puniſhing violaters of the ſtatutes, &c. See PROCTOR.— Add to theſe a *public orator*, *keeper of records*, *regiſter*, *beadles*, and *verger*.

For the degrees taken up in each faculty, with the exerciſes, &c. requiſite thereto, ſee DEGREE; ſee alſo DOCTOR, BACHELOR, &c.

UNIVOCAL, in the ſchools, is applied to two or more names, or terms, that have but one ſignification.— In oppoſition to *equivocal*, which is, where one term has two or more ſignifications. See EQUIVOCAL.

Or, *univocal terms*, are ſuch whoſe name, as well as nature, is the ſame; in oppoſition to *equivocals*, whoſe names are the ſame, but their natures very different. See UNIVOCALS.

For a thing to be predicated *univocally* of any others, it is to be attributed to all of them alike, and in the ſame proper ſenſe. See PREDICATE, and PREDICABLE.

UNIVOCAL *Generation*.— The doctrine of the antients, with reſpect to propagation, was, That all perfect animals were produced by *univocal generation*; that is, by the ſole union, or copulation of a male and ſemale of the ſame ſpecies, or denomination: and, that inſects were produced by equivocal generation, without any ſeed, and merely of the corruption of the earth exhaled, and, as it were, impregnated by the ſun's rays. See EQUIVOCAL, INSECT, &c.

Some philoſophers make a kind of intermediate generation between equivocal and *univocal*, which they call *analogous generation*. See GENERATION.

UNIVOCAL *Action*. UNIVOCAL *Cauſe*.	See the article	ACTION. CAUSE.

UNIVOCALS, called by the Greeks *ſynonima*, are defined by Ariſtotle to be thoſe things whoſe name is common, and alſo the reaſon correſponding to the name; that is, the definition of the idea affixed to it, the ſame. See UNIVOCAL.

Thus, under the name and definition of *animal*, man and brute are equally included; and circle and ſquare, in the reaſon or definition of a *figure*.

Here, the word, as *figure*, they uſe to call *univocum univocans*, or *univocating univocal*; and the things included under the *univocal* name, as *circle*, and *ſquare*, *univoca univocata*, *univocated univocals*.

UNIVOCATION, in logics, and metaphyſics.— The ſchoolmen have long diſputed about the *univocation* of being, *i. e.* whether the general idea of *being* agree in the ſame manner, and in the ſame ſenſe, to the ſubſtance and the accident; to God, and the creature?

UNKNOWN. See the article UNCUTH.

UNLAWFUL, *illegal*, ſomething prohibited by, or contrary to the terms of law, either divine or human. See LAW.

UNLAWFUL *Aſſembly*, the meeting of three or more perſons together, by force to commit ſome unlawful act; as, to aſſault any perſon, to enter his houſe, or land, &c. and thus abiding together, whether they attempt the execution, or not. See ASSEMBLY, RIOT, &c.

By the ſtat. 16 Car. II. if five perſons, or more, ſhall be aſſembled together, above thoſe of the family, at any conventicle or meeting, under colour of any exerciſe of religion, it is *unlawful*, and puniſhable by fines, and otherwiſe, as in that ſtatute is provided.

UNLIKE *Quantities*, and *Signs*, in algebra. See LIKE *Signs*, and *Quantities*: ſee alſo SIGN, and QUANTITY.

UNLIMITED, or *indeterminate Problem*, is ſuch a one as is capable of infinite ſolutions.— As, to divide a triangle given into two equal parts; to make a circle paſs through two points aſſigned, &c. See PROBLEM.

UNLUTING, in chymiſtry, the taking away of the lute, loam, or clay, wherewith a veſſel is cloſed, joined to another, or the like. See LUTE.

UNMOOR, a term uſed at ſea, when a veſſel that before rid, or was held by two anchors, is begun to be diſengaged and prepared to weigh. See ANCHOR, and MOORING.

UNQUES *Priſt*, *always ready*. See UNCORE *Priſt*.

UNREEVING *a Rope*. See the article REEVING.

UNRIGGING *of a Ship*, is the taking away the rigging, or cordage. See RIGGING.

UNSEELING, in falconry, a taking away the thread that runs through the hawk's eye-lids, and hinders her ſight. See HAWK, and FALCONRY.

Drawing the ſtrings of the hood, to be in readineſs to pull off, is called *unſtriking the hood*.

UNWRITTEN *Tradition*. See the article TRADITION.

VOCABULARY*, VOCABULARIUM, in grammar, denotes a collection of the words of a language, with their ſignifications: otherwiſe called a *dictionary*, *lexicon*, or *nomenclature*. See WORD, NOMENCLATURE, &c.

* The word is French, formed of the obſolete term *vocable*; of the Latin, *vocabulum*, word.

The *vocabulary* is, properly, a leſſer kind of dictionary, which does not enter ſo minutely into the origins, and different acceptations of words. See DICTIONARY.— Though the Italian *vocabulary* of the academy de la Cruſca ſeems to be an exception from this diſtinction; as being a copious and exact work, in three volumes folio, ſaid to have been forty years in compiling.— And the like holds of the *vocabulario* Portuguez of F. Bluteau, in ten volumes folio.

VOCAL, ſomething that relates to the voice, or ſpeech. See VOICE, &c.

Thus, *vocal prayer* is that ſpoke out, or delivered in words, in contradiſtinction to *mental prayer*. See PRAYER.

In our antient cuſtoms, VOCALIS is frequently uſed for ſ *called*:— *Poſt hæc Morganus de tribu Walenſium*, &c. *alter nomine Madocus* vocalis *princeps eorum*. Matt. Paris.

VOCAL is ſometimes alſo uſed ſubſtantively, in ſpeaking of matters of election, to ſignify a perſon who has a right to vote.— A man muſt have been religious a certain number of years, to be *vocal*. See VOTE.

VOCAL *Muſic*, is muſic ſet to words, eſpecially verſes; and to be performed with the voice.— In contradiſtinction to *inſtrumental muſic*, compoſed only for inſtruments, without ſinging. See MUSIC.

Poetry then makes a neceſſary part of *vocal muſic*; and this appears to have been the chief, if not the only practice of the antients, from the definitions which they give us of muſic. See HARMONY, &c.

Their *vocal muſic* ſeems to have had ſome advantage over ours, in that the Greek and Latin languages were better contrived to pleaſe the ear than the modern ones.— In effect, Voſſius taxes all the later languages as unfit for muſic, and ſays, "We ſhall never have any good *vocal muſic*, till our "poets learn to make verſes on the model of the antients;" *i. e.* till the antient metrical feet and quantities are reſtored. See VERSE, and QUANTITY.

But it is to be obſerved, that the rhythmus of their *vocal muſic*, was only that of their poetry; and had no other forms and mutations, than what the metrical art afforded. See MUTATION.

Their changes were no other than from one kind of metrum or verſe to another; as from iambic, to choraic. See MEASURE, and RHYTHMUS.

Their *vocal muſic*, then, conſiſted of verſes ſet to muſical tunes, and ſung by one or more voices, in chorus, or alternately; ſometimes with, and ſometimes without the accompaniments of inſtruments. See SYMPHONY.

For inſtrumental muſic, in the manner we have defined it, it is not very clear they ever had any. See SYNAULIA, &c.

VOCATION, *Calling*; among divines, the grace or favour which God does any one in calling him out of the way of death, and putting him into the way of ſalvation.

In this ſenſe, we ſay, the *vocation of the Jews*, the *vocation of the Gentiles*, &c.— There are two kinds of *vocation*; the one *external*, the other *internal*.— The firſt conſiſts in a ſimple and naked propoſing of objects to the will.— The ſecond, is that which renders the firſt effectual, by diſpoſing our faculties to receive thoſe objects.

VOCATION, is alſo uſed for a deſtination to any ſtate, or profeſſion.— It is a rule, that none are to enter the eccleſiaſtic or monaſtic ſtate, without a particular *vocation*, or call. See ORDERS, ORDINATION, &c.

The Romaniſts hold the *vocation* of the reformed divines null and invalid.— Among ourſelves, ſome hold an uninterrupted ſucceſſion neceſſary to the validity of the *vocation* of a prieſt.

VOCATIVE, in grammar, the fifth caſe, or ſtate of nouns. See CASE.

When we name the perſon we are ſpeaking to, or addreſs ourſelves to the thing we are ſpeaking of, as if it were a perſon: the noun or name acquires a new relation, which the Latins and Greeks expreſs by a new termination, called the *vocative*.

Thus, of *Dominus*, Lord, in the nominative, the Latins have made *Domine*, O Lord, in the *vocative*; of *Antonius*, *Antoni*, &c.— But as this was a thing not abſolutely neceſſary, and as the nominative caſe might ſerve on ſuch occaſions, this new caſe, or termination, was not univerſal: in the plural, for inſtance, it was the ſame with the nominative; and even in the ſingular, it was only practiſed in the ſecond declenſion among the Latins; and in Greek, where it is the moſt common, it is frequently neglected, and the nominative uſed inſtead of it: as in that paſſage in the Greek pſalms, quoted by St. Paul, to prove the divinity of Jeſus Chriſt, ϑρονος σȣ, ὁ Θεος, thy throne, O God!

In Engliſh, and moſt of the modern tongues, this caſe is ordinarily expreſſed in nouns that have an article in the nominative, by ſuppreſſing that article: as, *the Lord is my hope*— *Lord, thou art my hope!* though, on many occaſions, we uſe an interjection.

VOCIFERATIO*, in our old law-books, the ſame with *hue and cry*. See HUE *and Cry*.

* — *Qui furem plegiatum dimiſerit, qui ei obviaverit & gratis ſine* vociferatione *dimiſerit*, &c. Leg. Hen. I.

VOICE, VOX, a ſound produced in the throat and mouth of an animal, by an apparatus of inſtruments for that purpoſe. See SOUND.

Voices are either *articulate*, or *inarticulate*.

Articulate VOICES, are thoſe whereof ſeveral conſpire together to form ſome aſſemblage, or little ſyſtem of ſounds.— Such are the *voices* expreſſing the letters of an alphabet, numbers of which joined together, form words. See LETTER, and WORD.

Inarticulate VOICES, are ſuch as are not organized, or aſſembled into words: ſuch is the barking of dogs, the braying of aſſes, the hiſſing of ſerpents, the ſinging of birds, &c.

The formation of the *human voice*, with all the varieties thereof obſerved in ſpeech, muſic, &c. make a very curious article of inquiry; ond the apparatus and organiſm of the parts miniſtring thereto, is ſomething exceedingly ſurpriſing.

Thoſe parts are, the trachea, or wind-pipe, through which the air paſſes and repaſſes into the lungs; the larynx, which is a ſhort cylindirc canal, at the head of the trachea; and the glottis, which is a little oval cleft, or chink, left between two ſemicircular membranes, ſtretched horizontally withinſide the larynx; which membranes, though capable of joining cloſe together, do generally leave an interval, either greater or leſs, between them, called the *glottis*.— See particular deſcriptions of each of theſe parts, under the articles TRACHEA, LARYNX, and GLOTTIS.

The long canal of the trachea, terminated a-top with the glottis, appears ſo like a flute, that the antients made no doubt but the trachea contributed the ſame to the *voice*, as the body of the flute does to the ſound of that inſtrument.— Galen himſelf fell, in ſome meaſure, into the miſtake: he perceived, indeed, that the principal organ of *voice* was the glottis; but he ſtill allowed the trachea a conſiderable ſhare in the production of ſound.

Galen's opinion was followed by all the antients after him; and even by all the moderns, before M. Dodart.— But that author, obſerving that we do not either ſpeak or ſing, when we inſpire, or take in the air, but only when we expire, or expel it; and that, the air coming out of the lungs, paſſes always out of the miniuter veſicles of that part into larger; and at laſt into the trachea itſelf, which is the largeſt of all: that thus its paſſage becoming ſtill more free and eaſy, and this more than ever in the trachea, it can never undergo ſuch a violence, and acquire ſuch a velocity in that canal, as is required to the production of ſound.— But that, as the aperture of the glottis is very ſmall, in compariſon with the width of the trachea, the air can never get out of the trachea by the glottis, without a vaſt compreſſion and augmentation of its velocity; and that by this means, in paſſing, it communicates a briſk agitation to the minute parts of the two lips of the glottis, gives them a kind of ſpring, and occaſions them to make vibrations; which, communicated to the paſſing air, occaſions the ſound. See VIBRATION.

This ſound, thus formed, proceeds into the cavity of the mouth and noſtrils; where it is reflected, and reſounds: and on this reſonance, M. Dodart ſhews, it is that the agreeableneſs of the *voice* intirely depends. – The different conſiſtences, forms, &c. of the divers parts of the mouth, contribute to the reſonance, each in their way; and from this mixture of ſo many different reſonances in their due proportion, reſults a harmony in the human *voice*, inimitable by any muſician.— Hence it is, that when any of theſe parts is diſordered, *e. gr.* the noſe ſtopped, the *voice* becomes diſpleaſing.

This reſonance in the cavity of the mouth, does not ſeem to conſiſt in a ſimple reflexion, ſuch as that of a vault, &c. but in a reſonance proportionate to the tones of the ſound ſent into the mouth from the glottis; and accordingly, we find this cavity to lengthen and ſhorten itſelf, according to the depth or acuteneſs of the tone.

Now, for the trachea to effect this reſonance, as it was the common opinion it did, it would be required, that the air, after its being modified, and turned into ſound by the glottis, inſtead of continuing its courſe from within outwards, ſhould return from without inwards, and thus ſtrike on the ſides of the trachea: which can never happen, except in thoſe who have a violent cough, and in ventriloquous perſons.— Indeed, in moſt river fowl, which have a very ſtrong *voice*, the trachea does reſound; but the reaſon is, that the glottis is placed at the bottom of the trachea, and not at the top, as in men.

That canal, then, which at firſt paſſed for the principal organ of *voice*, is found not to be ſo much as the ſecondary one, *i. e.* not that which occaſions the reſonance.— It does not ſerve the glottis, as the body of a flute does its plug; but inſtead of that, the mouth ſerves the glottis, as the body of ſome other wind-inſtrument not yet known in muſic.— In effect, the office of the trachea is no other, than that of the port-vent in an organ, *viz.* to furniſh wind.

For the cauſe of the different tones of VOICE.— As the organs that form the *voice* make a kind of wind-inſtrument, one might expect to find ſome proviſion therein, anſwerable to that which produces the differences of tones in ſome other wind-inſtruments.— But in the divers kinds of wind-inſtruments, the hautboy, organ, clarion, &c. there is none.— The tone, therefore, muſt be attributed either to the mouth and noſtrils, which occaſion the reſonance, or to the glottis, which produces the ſound: and as all the different tones are produced in man by the ſame inſtrument, it follows, that the part which produces them muſt be capable of changes anſwerable thereto.

Now, for a grave tone, we know there is more air required than for an acute one.— The trachea, therefore, to let this greater quantity paſs, muſt dilate and ſhorten itſelf; by which ſhortening, the external canal, that is, the canal of the mouth and noſe, reckoned from the glottis to the lips, or noſtrils, is lengthened.— For, the ſhortening of the internal canal, *i. e.* of the trachea, brings the larynx and glottis lower down; and of conſequence makes its diſtance from the mouth, &c. greater: and there is a change in the length of each canal, for every change of tone, and ſemitone.— Accordingly, it is eaſy to obſerve, that the knot of the larynx alternately riſes and falls in all quaverings, or ſhakings of *voice*, how ſmall ſoever the difference of tone may be.

Hence, as the depth of the tone of a hautboy, is anſwerable to the length of the inſtrument; or longeſt fibres of the wood, whoſe vibrations make the reſonance, making always the ſloweſt vibrations, and conſequently the deepeſt tone: it may appear probable, that the concavity of the mouth, by its lengthening for grave tones, and ſhortening for acute ones, might ſerve very well for the production of the divers tones: but M. Dodart obſerves, that in that play of the organ called the *human voice*, the longeſt pipe is ſix inches, and yet with all that length, it does not make any difference of tone; but the tone of the pipe is preciſely that of the plug; whereas the concavity of the mouth of a man of the graveſt *voice*, not being above ſix inches deep; it is evident that cannot modify, vary, and give the tone. See TUNE.

It is the glottis, then, that forms the tone, as well as the ſound; and the manner of forming the various tones, is by varying its aperture.— A piece of mechaniſm too admirable, not to be here particularly inquired into.

The human glottis, then, repreſented in *Tab. Nat. Hiſtory, fig.* 11. is only capable of one proper motion, *viz.* that of an approach of its lips, ADD, and ADB.— Accordingly, the dotted lines AEB, AFB, AGB, exhibit three different degrees of approach.— Theſe different apertures of the glottis, anatomiſts uſually attribute to the action of the muſcles of the larynx; but M. Dodart ſhews, from their poſition, direction, &c. that they have other uſes; and that the opening and ſhutting of the glottis is effected by other means, *viz.* by two tendinous cords, or ſtrings, incloſed in the two lips of that aperture.

In effect, each of the two ſemicircular membranes, whoſe interſtice forms the glottis, is doubled back upon itſelf; and within each duplicature is a cord or ſtring, which is faſtned at one end, to the fore-part of the larynx, and to the hind-part at the other.— It is true they appear more like ligaments than muſcles; as conſiſting of white and membranous fibres; not of red and fleſhy ones: but the vaſt number of minute changes in this aperture, neceſſary to form the vaſt variety of tones, make an extraordinary kind of muſcle, by whoſe contraction they ſhould be effected, abſolutely neceſſary.– Common fleſhy fibres, wherein the blood is received in large quantity, had been infinitely too coarſe for ſuch delicate motions.

Theſe ſtrings, which in their ſtate of relaxation make each a little arch of an ellipſis; as they contract more and more, become longer, but leſs and leſs curve; and at laſt, with the greateſt contraction they are capable of, degenerate into two right lines, applied cloſe to each other; ſo cloſe, and ſo firm, that an atom of air cannot eſcape out of the lungs, how full ſoever they may be, and how great an effort ſoever all the muſcles of the lower venter may make againſt the diaphragm, and by the diaphragm, againſt theſe two little muſcles.

The different apertures of the lips of the glottis, then, produce all the different tones in the ſeveral parts of muſic, *viz.* *baſs*, *tenor*, *counter-tenor*, *treble-baſs*, and *treble*; and the manner is thus:

The *voice*, we have ſhewn, can only be formed by the glottis; but the tones of the *voice*, are modifications of the *voice*, and can only be produced by the modifications of the glottis.— Now the glottis is only capable of one modification; which is, the mutual approach or receſs of its lips: it is this, therefore, produces the different tones.— Now that modification includes two circumſtances: the firſt, and principal, is, that the lips are ſtretched more and more, from the loweſt tone to the higheſt; the ſecond is, that the more they are ſtretched, the nearer they approach.

From the firſt it follows, that their vibrations will be ſo much the quicker, as they come nearer their higheſt tone; and that the *voice* will be juſt, when the two lips are equally ſtretched, and falſe, when unequally; which agrees perfectly well with the nature of ſtring inſtruments.

From the ſecond it follows, that the higher the tones are, the nearer will they approach each other; which agrees perfectly well with wind inſtruments, governed by reeds, or plugs.

The degrees of tenſion of the lips, are the firſt and principal cauſe of tones; but their differences are inſenſible.— The degrees of approach, are only conſequences of that tenſion; but their differences are more eaſily aſſigned.

To give a preciſe idea of the thing, therefore, we had beſt keep to that; and ſay, that this modification conſiſts in a tenſion, from whence reſults a very numerous ſubdiviſion of a very ſmall interval; which yet, ſmall as it is, is capable, phyſically ſpeaking, of being ſubdivided infinitely. See DIVISIBILITY.

The doctrine is confirmed, from the different apertures found in diſſecting perſons of different ages, of both ſexes.— The aperture is leſs, and the exterior canal always ſhallower in the ſex and ages fitteſt to ſing treble.— Add, that the reed of a hautboy, ſeparated from the body of the inſtrument, being a little preſſed between the lips, will yield a tone, ſomewhat higher than its natural one; and if preſſed ſtill more, will yield another ſtill higher: and thus an able muſician may run ſucceſſively through all the tones, and ſemi-tones of an octave. It is different apertures, then, that produce, or at leaſt accompany different tones, both in natural wind inſtruments, and artificial ones; and the diminution of the aperture, raiſes the tones both of the glottis, and the reed.

The reaſon why leſſening the aperture heightens the tone, is, that the wind paſſes through it with the greater velocity; and from the ſame cauſe it is, that if any reed, or plug of an inſtrument be too weakly blown, its tone will be lower than ordinary.

Indeed, the contractions and dilatations of the glottis, muſt be infinitely delicate: by an exact calculation of the ingenious author abovementioned, it appears, that to perform all the tones and ſemitones of a common *voice*, which is computed to reach twelve tones, to perform all the particles and ſubdiviſions of thoſe tones into commas, and other minuter, though ſtill ſenſible parts; to perform all the ſhades, or the differences in a tone, when ſounded more or leſs ſtrong, without changing the tone: the little diameter of the glottis, which does not exceed $\frac{1}{10}$ of an inch, but which varies within that extent at every change, muſt be actually divided into 9632 parts; which parts are yet very unequal, and therefore many of them much leſs than the $\frac{1}{963200}$ part of an inch.— A delicacy ſcarce to be matched by any thing but a good ear, which has ſo juſt a ſenſe of ſounds as, naked, to perceive difference in all theſe tones; even thoſe whoſe origin is much leſs than the 963200th part of an inch. See HEARING.

VOICE, in grammar, is a circumſtance in verbs, whereby they come to be conſidered, as either *active*, or *paſſive*, *i. e.* either as expreſſing an action impreſſed on another ſubject, as *I beat*; or receiving it from another, as *I am beaten*. See VERB; ſee alſo ACTIVE, and PASSIVE.

VOICE, in matters of elections, denotes a *vote*, or *ſuffrage*. See VOTE, SUFFRAGE, &c.

In this ſenſe, a man is ſaid to have a *deliberative voice*, when he has a right to give his advice and opinion in a matter of debate, and his ſuffrage is taken.— An *active voice*, when he gives his vote for the election of any one; and a *paſſive voice*, when the ſuffrages may fall on himſelf to be elected.— An *excitative voice*, when he may act to procure another to be elected.— A *conſultative voice*, when he can only offer reaſons and remonſtrances, whereon the chief, or head, determines at his own diſcretion: ſuch the cardinals have, with regard to the pope; the maſters of chancery, with regard to the lord chancellor, *&c.*

Part of the VOICE, in muſic. See the article PART.

VOID *Space*, in phyſics. See the article VACUUM, &c.

VOID, in common law. See ANNULLING, ABROGATION, RESCISSION, REVOCATION, *&c.*

VOID *Baſtions*. See the article BASTION.

VOIDANCE, VACANCY, in the canon law, a want of an incumbent upon a benefice. See VACANCY, &c.

This is twofold, either in law, *de jure*; as when one holds ſeveral benefices that are incompatible: or *de facto*, in deed; as when the incumbent is dead, or actually deprived. See BENEFICE, PLENARTY, &c.

VOIDED, UUIDE', in heraldry, is underſtood of an ordinary, whoſe inner or middle part is cut out; leaving nothing but its edges to ſhew its form; ſo that the field appears through it. Hence, it is needleſs to expreſs the colour, or metal of the *voided* part; becauſe it muſt, of courſe, be that of the field.

The Croſs VOIDED, differ from the croſs *fimbriated*, in that this latter does not ſhew the field through it, as the other does.—And the ſame obtains in other ordinaries.

VOIDER, in heraldry, one of the ordinaries, whoſe figure is much like that of the flaſque, or flanch; only that it doth not bend ſo much.— See *Tab. Herald. fig.* 89. ſee alſo the article FLANCH.

This armoury, they ſay, is properly the reward of a gentlewoman that has well ſerved her prince.— It is always born by pairs.

VOIDED, *Evacuating*, in medicine. See EVACUATION.

In the *Philoſophical Tranſactions*, we have an account of one Matt. Milford, who *voided* a worm by urine, ſuppoſed to have come from the kidneys. See WORMS.

Dr. Liſter mentions true caterpillars *voided* by a boy of nine years old.— Mr. Jeſſop ſaw hexapods vomited up by a girl. — Catherina Geilaria, who died in 1662, in the hoſpital of Altenburg, for 20 years *voided*, by vomit and ſtool, toads, and lizards. *Ephem. German.* T. I. Obſ. 103.

In the ſame *Ephem.* is an inſtance of a kitten, bred in the ſtomach, and vomited up.— Of whelps, frogs, lacertæ aquaticæ, and other animals, bred and *voided* the like way.— Bartholine gives us an inſtance of a worm, bred in the brain, and *voided* by the noſe of O. W. See VERMES.

VOIR *Dire*, in law— When, upon a trial at law, it is prayed that a witneſs may be ſworn upon a *voir dire*; the meaning is, that he ſhall upon his oath ſpeak or declare the truth, whether he ſhall get or loſe by the matter in controverſy.— If he be unconcerned, his teſtimony is allowed; otherwiſe, not. See OATH, WITNESS, &c.

VOL, among heralds, ſignifies the two wings of a fowl joined together, born in armoury; as being the whole that makes the flight.— Accordingly, a *demi-vol*, is a ſingle wing.

VOLA, the palm, or inſide of the hand, comprehended between the fingers and the wriſt. See HAND.

VOLANS. See the articles DRACO, and PISCIS.

VOLANT, in heraldry, is when a bird, in a coat of arms, is drawn flying, or having its wings ſpread out.

Paſs-VOLANT. } See the article { PASS-*Volant*.
Pont-VOLANT. } See the article { PONT.

VOLATILE, in phyſics, is commonly uſed to denote a mixt body, whoſe integral parts are eaſily diſſipated by fire, or heat; but is more properly uſed for bodies, whoſe elements, or firſt component parts, are eaſily ſeparated from each other, and diſperſed in air. See BODY, COHESION, ELEMENT, &c.

For, as any mixt body is ſaid to be *fixt*, in a double ſenſe; ſo may it be ſaid to be *volatile* two ways: whence the ſame body, *e. gr.* mercury, is both *volatile*, and fixt at the ſame time.

Since, as its integral parts, or thoſe which ſtill retain the nature of mercury, are eaſily ſeparable by fire, and readily fly away; it is ſaid to be *volatile*: and yet, as it is very difficult to deſtroy its contexture, and reſolve it by fire, or any other menſtruum, into its firſt elements, it is ſaid to be *fixt*.— The ſame may be ſaid of ſulphur, antimony, &c.

Minerals, for the generality, are leſs *volatile* than vegetables, and vegetables leſs than animals. See FIXT.

The chymiſts diſtinguiſh between *volatile* ſalts, and fixt ſalts. See SALT.— The capitals of aludels, ſtop and collect the *volatile* parts of ſubſtances in ſublimation; and make what we call *flowers*. See FLOWERS, SUBLIMATION, &c.

"The particles of fluids, which do not cohere very ſtrongly
"together, and are of ſuch ſmallneſs, as renders them moſt
"ſuſceptible of thoſe agitations, which keep liquors in a fluor,
"are eaſily rarified into vapour; and, in the language of the
"chymiſts, are *volatile*.— Thoſe which are groſſer, and ſo
"leſs ſuſceptible of alterations; or cohere by a ſtronger heat,
"or, perhaps, not without fermentation; theſe are what the
"chymiſts call *fixt bodies*." *Newton. Optic.* p. 371.

VOLATILE, in chymiſtry— When the fire decompounds any mixt body, the parts moſt diſpoſed to receive a great motion, are ſooner looſened, and riſe up in the order, which the differences of that diſpoſition give them; the reſt remaining immoveable at the bottom of the veſſel. See ANALYSIS, FIRE, *&c.*

Thoſe that riſe firſt are called *volatile parts*; ſuch are *phlegm*, *oil*, *ſpirits*, and *ſalts* both urinous, and alkalious. See SPIRIT, PHLEGM, and SALT.

The parts remaining, *viz. earth*, and *lixivial ſalts*, are called *fixt*. See FIXT, EARTH, and VOLATILISATION.— *For the making of fixt ſalts* volatile; ſee VOLATILISATION.

VOLATILE *Alkaly*. } See the article { ALKALY.
VOLATILE *Salt of amber*. } See the article { AMBER.

Sal VOLATILE *Oleoſum*. See the article SAL.

VOLATILISATION, or VOLATILIZATION, the act of rendering fixt bodies *volatile*; or of reſolving them by fire into a fine, ſubtile vapour, or ſpirit, which eaſily diſſipates, and flies away. See VOLATILE.

All bodies, even the moſt fixt, as gold, may be *volatilized*; either of themſelves, or with the admixture of ſome *volatile* ſubſtance, or ſpirit; by diſtillation, or ſublimation. See DISTILLATION, and SUBLIMATION; ſee alſo GOLD, BURNING-GLASS, &c.

In the *Memoirs of the royal Academy*, we have a diſcourſe on the *volatiliſation of the fixt ſalts of plants*, by M. Homberg. — That admirable chymiſt, it ſeems, by an odd accident, found fixt ſalts ſpontaneouſly *volatilized* in ſoap: Now ſoap, we know, is a compoſition of oil, and the alkalious lixivial ſalts of the plant kali.— Upon this, M. Homberg conjectured, that the oil, from which the volatile ſalts ſeem to derive their volatility, being intimately mixed with the fixt ſalts of the kali in the ſoap, had rendered them *volatile*: ſo that they ceaſed to be alkalious, by reaſon their pores were now filled with the oil which they had abſorbed.— Oil, in effect, has always ſomewhat of an acid in it; which acid, being joined to the alkali, the whole is rendered a kind of intermediate ſalt; which yet, as the acid and alkali were only joined by means of the oil, is ſtill oily or ſulphurous.

In conſequence of this view, he made divers chymical operations, whereby he found, that to diſpoſe the fixt ſalts of plants to *volatiliſe*, the proceſs is to be begun, by making them into a ſapo, and letting that ſapo ſhoot out little ſaline points, or cryſtals on its ſurface; which cryſtals are no other than fixt ſalts already *volatiliſed*.— Then, the remainder of the matter is to be ſet over the fire, after being well imbibed and penetrated by ſome new liquor, proper to aſſiſt in a new ſublimation of more fixt ſalts to be *volatilized:* and this to be repeated till no more ſalts will riſe.

The choice of the liquor, wherewith the ſapo is to be ſaturated, is not indifferent — Water is, of all others, the leaſt fit for the effect: oil does well; yet diſtilled oil better than that drawn by expreſſion: and ſpirit of wine beſt of all.

By ſuch means, M. Homberg *volatilized* almoſt half a quantity of ſalt of tartar, which is a fixt vegetable ſalt. See TARTAR.

VOLATILITY. See VOLATILE, SUBLIMATION, &c.

VOLCANO, or VULCANO, in natural hiſtory, a name given to mountains that belch, or vomit fire, flame, aſhes, cinders, ſtones, *&c.* See MOUNTAIN.

Such are mount Etna in Cicily, mount Veſuvius near Naples, *&c.* See ERUPTION.

Near Guatimala, in South America, are two mountains, the one called *volcano of fire*; the other *of water*.— Out of the firſt, huge pieces of rocks are frequently hurled, with as much vehemence as balls out of a cannon; and a written letter may be read by the light of its flames, at the diſtance of three miles.— Out of the other, vaſt quantities of water are continually ſpued up.

Volcano's and ignivomous mountains, though ſome of the moſt terrible phænomena in nature, have their uſes; being a kind of ſpiracles, or tunnels, whereby to vent the fire and vapour, that would otherwiſe make a more dreadful havock, by convulſions and earthquakes.

Nay, if the hypotheſis of a central fire and waters, be admitted; theſe outlets muſt be abſolutely neceſſary to the peace and quiet of the terraqueous globe.— Accordingly, Dr. Woodward obſerves, there is ſcarce any country much annoyed with earthquakes, but has one of theſe fiery vents; which is conſtantly obſerved to be all in flames, whenever an earthquake happens; by which means, it diſgorges that fire, which, while it was underneath, was the cauſe of the diſaſter. — He adds, that were it not for theſe diverticula, whereby the central fire has an exit, it would rage in the bowels of the earth much more furiouſly, and make much greater havock than it does; and that there are not wanting inſtances of countries, that have been wholly freed from earthquakes, by the eruption of a new *volcano* there. See EARTHQUAKE.

VOLERY, a great bird-cage, ſo large, that the birds have room to fly up and down in it. See AVIARY.

VOLITION, the act of willing. See WILL.

VOLITIVE *Thinking.* See the article THINKING.

VOLLEY, a military ſalute, made by diſcharging a great number of fire-arms at the ſame time. See SALUTE.

In the *Philoſophical Tranſactions*, Mr. Robert Clarke gives us an account of a very remarkable effect of firing ſome *volleys* of ſmall ſhot: "Upon proclaiming the peace, in 1697, two
" troops of horſe were drawn in a line, the centre whereof
" was againſt a butcher's door, who kept a very large, cou-
" ragious maſtiff dog, the biggeſt in the town.
" Upon firing of the firſt *volley*, the dog, who before lay
" aſleep by the fire, ſtarted up, ran into an upper room,
" and hid himſelf under the bed.— The ſervant being about
" to beat him down, (as he had never uſed to go up ſtairs)
" a ſecond *volley* came; which made the dog riſe, run ſeveral
" times about the chamber, with violent tremblings, and
" ſtrange agonies.— But immediately a third *volley* came;
" upon which the dog ran once or twice about, fell down,
" and died immediately; throwing out blood at mouth and
" noſe."

VOLO, in antiquity, a name which the Romans gave the ſlaves, who, in the ſecond Punic war, offered themſelves to ſerve in the army; upon a want of a ſufficient number of citizens. See SLAVE.

The name *volo*, *volones*, they are ſaid to have had from their offering themſelves voluntarily.— Feſtus ſays, it was after the battle of Cannæ that this happened: Macrobius, *Sat.* Lib. I. cap. II. places it before that battle.

Capitolinus tells us, that Marcus Aurelius formed troops, or legions of ſlaves, which he called *voluntarii*; and that the like forces, in the ſecond Punic war, had been called *volones*. — But before M. Aurelius, Auguſtus had given the name *voluntarii* to forces which he had raiſed out of *liberti*, or freedmen; as we are aſſured by Macrobius, *Sat.* Lib. I. cap. ii.

VOLTE, in the manage, ſignifies a round or circular motion, conſiſting of a gait of two treads, made by an horſe going ſideways round a centre; the two treads marking parallel tracks, one by the fore feet, larger; and the other by the hind feet, ſmaller: the ſhoulders bearing outwards, and the croup approaching towards the centre.

Demi-VOLTE, is a half-round of one tread, or two, made by the horſe at one of the angles or corners of the *volte*, or at the end of the line of the paſſade; ſo as when he is near the end of this line, or near one of the corners of the *volte*, he changes hands, to return by a ſemicircle.

Renverſed, or *inverted* VOLTE, is a track of two treads, which the horſe makes with his head to the centre, and his croup out; going ſideways upon a walk, trot, or gallop, and tracing out a larger circumference with his ſhoulders, and a ſmaller with his croup.

VOLUME*, VOLUMEN, a book, or writing, of a juſt bulk, to be bound by itſelf. See BOOK.

* The word had its riſe *à volvendo*, rolling, or winding; the antient way of making up books, being in rolls of bark, or parchment. See ROLL.

This manner laſted till Cicero's time, and long after that paper was invented, and books wrote thereon.— The ſeveral ſheets were glued, or paſted end to end, wrote only on one ſide; and at the bottom a ſtick faſtened, called *umbilicus*; and at the other end a piece of parchment, whereon was the title of the book in letters of gold. See BOOK, PAPER, *&c.*

And yet, we are aſſured, king Attalus, or rather Eumenes, had, long before, done up ſome of his books in the ſquare form; as having found the ſecret of parchment, which would bear writing on both ſides. See PARCHMENT.

The library of Ptolemy king of Egypt, contained, according to Aulus Gellius, three hundred thouſand *volumes*; and, according to Sabellicus, ſeven hundred thouſand. See LIBRARY.

Raymond Lully wrote above four thouſand *volumes*; whereof we have divers catalogues extant.— It is held, that Triſmegiſtus wrote ſix thouſand five hundred twenty five *volumes*; others ſay, thirty ſix thouſand five hundred twenty nine: But it is much more rational to ſuppoſe, with la Croix, that it was the cuſtom of the Egyptians to put all the books they compoſed, under the name of *triſmegiſtus*.

At preſent, VOLUME is chiefly uſed in the ſame ſenſe with *tome*, for a part or diviſion of a work, bound ſeparately.— In this ſenſe, we ſay, "the councils are printed at the Louvre " in 37 *volumes*. See TOME.

VOLUME *of a Body*, is alſo uſed, among foreign philoſophers, for its *bulk*, or the ſpace incloſed within its ſuperficies. See BODY, MASS, *&c.*

VOLUMUS, in law, the firſt word of a clauſe in one ſpecies of the king's writs of protection, and letters patent. See PROTECTION.

VOLUNT, VOLUNTAS, in law, is when a tenant holds lands, *&c.* at the will of the leſſor, or lord of the manor. See TENANT, VASSAL, *&c.*

VOLUNTARY, in the ſchools.— The generality of philoſophers uſe *voluntary* in the ſame ſenſe with *ſpontaneous*; and apply it to any thing ariſing from an internal principle, attended with a due knowledge thereof.— In which ſenſe, they ſay, "A dog moves *voluntarily* when he runs to the pot. See SPONTANEOUS.

Ariſtotle, and his followers, reſtrain the term *voluntary* to thoſe actions that proceed from an inward principle, which knows all the circumſtances of the action.

There are two things, therefore, required to the *voluntarineſs* of an action: the firſt, that it proceed from an inward principle; thus, walking for pleaſure-ſake is a *voluntary* action; as ariſing from the will commanding, and the moving faculty obeying, which are both internal.— On the contrary, the motion of a man dragged to priſon is not *voluntary*.

The ſecond, that the action be performed with a perfect intelligence of the end, and circumſtances thereof: in which ſenſe, the actions of brutes, children, ſleeping people, *&c.* are not properly *voluntary*. See WILL.

Anatomiſts diſtinguiſh between the *voluntary*, and natural, or *involuntary motions* in the body. — Of the firſt kind are thoſe of the heart, lungs, pulſe, *&c.* See MUSCULAR, MOTION, ACTION, *&c.*

VOLUNTARY *Agent.*	See the article	AGENT.
VOLUNTARY *Eſcape.*		ESCAPE.
VOLUNTARY *Homicide.*		HOMICIDE.
VOLUNTARY *Novation.*		NOVATION.

VOLUTE*, VOLUTA, in architecture, a kind of ſpiral ſcroll, uſed in the Ionic, and Compoſite capitals; whereof it makes the principal characteriſtic, and ornament.— See *Tab. Archit. fig.* 41. *fig.* 26. *lit. D. fig.* 32. *litt. i i*; ſee alſo the article CAPITAL.

* Some call it the *ram's-horn*, from its figure, which bears a near reſemblance thereto.

Moſt architects ſuppoſe, that the antients intended the *volute* to repreſent the bark or rind of a tree, laid under the abacus, and twiſted thus at each extreme, where it is at liberty: others will have it a ſort of pillow, or bolſter, laid between the abacus and echinus, to prevent the latter being broke by the weight of the former, and the entablature over it; and accordingly call it *pulvinus*.— Others, after Vitruvius, will have it to repreſent the curls, or treſſes of a woman's hair. See IONIC *Order*.

The number of *volutes* in the Ionic order is four; in the Compoſite, eight.

There are alſo eight angular *volutes* in the Corinthian capital, accompanied with eight other ſmaller ones, called *helices*. See HELIX, CAULICOLE, *&c.*

There are ſeveral diverſities practiſed in the *volute*.— In ſome, the liſt or edge, throughout all the circumvolutions, is in the ſame line, or plane: ſuch are the antique Ionic *volutes*, and thoſe of Vignola.— In others, the ſpires or circumvolutions fall back; in others, project, or ſtand out.— Again, in ſome the circumvolutions are oval; in others, the canal of one circumvolution is detached from the liſt of another, by a vacuity or aperture.— In others, the rind is parallel to the abacus, and ſprings out from behind the flower thereof.— In others, it ſeems to ſpring out of the vaſe, from behind the ovum, and riſes to the abacus, as in moſt of the fine Compoſite capitals.

The *volute* is a part of great importance to the beauty of the column.— Hence, architects have invented divers ways of delineating it.— The principal are that of Vitruvius, which was long loſt, and at laſt reſtored by Goldman; and that of Palladio.—Daviler prefers the former as the eaſier.— The manner thereof is as follows.

Divide the altitude AB, (*Tab. Architecture, fig.* 12.) into eight equal parts, and aſſuming the fifth QP, for a diameter, from the centre G, with half the diameter GP, deſcribe a circle for the eye of the *volute*.— Biſſect the radii GP and GQ in 1 and 4, and ſubdivide the half parts G 1 and G 4, each into three equal parts: then, upon the right line 1 4, conſtruct a ſquare 1, 2, 3, 4; one of whoſe ſides 2, 3, continue on to D; another, 3, 4, to E; and the third, 1, 2, to C. From G draw right lines G 2 and G 3; which divide into three equal parts.— Then, through 6 and 10, draw 6 1 and 10 N, parallel to 2 D. And through 11 and 7 draw 11 O and 7 K, parallel to 3 E; and through 5 and 9, draw 5 H, and 9 M, parallel to 1 C.— Laſtly, from 12, 11, 10, 9, 8, &c. ſtrike the quadrants PO, ON, NM, ML, LK, &c. which will form the *volute*.

Conſoles, modillions, and other ſorts of ornaments, have likewiſe their *volutes*, or ſcrolls. See CONSOLE, &c.

Canal of the VOLUTE } See the article { CANAL.
Eye of the VOLUTE. } EYE.

VOLVULUS, in medicine, a name which ſome authors give to the iliac paſſion, by others called *chordapſus*, and by others, *miſere mei*. See ILIAC, CHORDAPSUS, and MISERERE.

VOMER, in anatomy, a Latin name, ſignifying, litterally, a *ploughſhare*; uſed by authors to denote the eleventh, or, according to the numeration of others, the thirteenth bone of the upper jaw: by reaſon of the reſemblance it bears to that utenſil. See MAXILLA.

The *vomer*, or *vomer aratri*, is a thin bone, placed in the middle of the noſe, over the palate, ſerving to part the two noſtrils from each other. See NOSTRIL.

It is ſmall, but hard, and is joined to the ſphenoides and ethmoides, which have each of them little eminencies that are received into the cavities of the *vomer*; by which means it is faſtened in its place. See NOSE.

VOMICA, in medicine, a collection of pus in any part of the body. See PUS, ABSCESS, IMPOSTHUME, &c.

When this maſs, or collection, is in the lungs, it is called *vomica pulmonum*.— When in the kidneys, *vomica renum*, &c. See PHTHISIS, &c.

The *vomica* of the lungs differs from an empyema, which is a collection of pus in the cavity of the thorax. See EMPIEMA.

Nux VOMICA, *Vomic Nut*, is a little flat, round, woody fruit, or ſeed; hard as horn, of a mouſe-colour without, but of various colours within: ſometimes yellow, ſometimes white, and ſometimes brown. See NUX.

It is not known what the plant is that bears it.— It is a poiſon for dogs, and divers quadrupeds, which it kills preſently, through exceſſive vomiting. See POISON.

VOMITING, VOMITUS, a violent caſting up, or evacuating by the mouth, what is contained in the ſtomach. See EVACUATION.

This action has been generally allowed to be owing, principally, to the contraction of the fibres of the ſtomach, when irritated by the acrimonious quality, or oppreſſed with the quantity of its contents. See STOMACH.

But M. Chirac, and after him M. du Verney, and others, ſet aſide the fibres of the ſtomach; and advance, that *vomiting* is produced wholly by the extraordinary motions of the diaphragm, and muſcles of the lower venter.— So that the ſtomach is here ſuppoſed deſtitute of all action, and caſts back its contents only by its being compreſſed and flatted, from ſome foreign and accidental cauſes.

However, Boerhaave, and moſt of our lateſt writers, allow both the ſtomach, the diaphragm, and the muſcles of the abdomen, to have their ſhare in the action of *vomiting*: accordingly, that diligent author makes *vomiting* to conſiſt in a convulſive and retrograde motion of the muſcular fibres of the gullet, ſtomach, and inteſtines; as well as thoſe of the abdomen, and the ſeptum tranſverſum; which, when in a leſs degree, produce a nauſea; and in a greater, a *vomiting*. See NAUSEA.

By the contraction of ſo many parts, the ſtomach comes to be ſqueezed, as in a preſs; whence it is obliged to give up what is contained in its cavity, and the neighbouring parts; juſt as water is in a bladder, or ſponge, when ſqueezed between the hands.

The evacuation, too, muſt be upwards, rather than downwards; by reaſon the paſſage is more open and eaſy that way, and that the inteſtines are preſſed by the diaphragm, and the muſcles of the lower venter.

The primary cauſe of *vomiting*, uſes to be the too great quantity, or too much acrimony of the contents, ariſing from poiſons, contuſions, compreſſions, inflammations, and wounds in the brain; inflammations of the diaphragm, ſtomach, inteſtines, ſpleen, liver, kidneys, pancreas, and meſentery; unuſual agitations in coaches, at ſea, &c. and *vomitive*, or emetic medicines. See EMETICS.

VOMITIVES, or VOMITIVE *Medicines*. See EMETICS.

VOPISCUS, a Latin term, uſed in reſpect of twins in the womb, for that which comes to the perfect birth; the other being before excluded abortive. See TWINS, and ABORTION.

VORTEX, *Whirlwind*, in meteorology, a ſudden, rapid, violent motion of the air, in gyres, or circles. See WHIRLWIND.

VORTEX, VORAGO, is alſo uſed for an *eddy*, or *whirlpool*; or a body of water, in certain ſeas and rivers, which runs rapidly around, forming a ſort of cavity in the middle.

The ordinary cauſe of theſe *vortices*, is a gulph, or outlet, whereby the water of the ſea, &c. is abſorbed, or precipitates itſelf into ſome other receptacles; ſometimes to ſome other communicant ſea; and ſometimes, perhaps, into the vaſt abyſs of central water. See ABYSS, &c.

An artificial VORTEX, expreſſive of the phænomena of the natural ones, may be made with a cylindric veſſel, placed, immoveable, on a horizontal plane, and filled to a certain heighth with water.— In this water a ſtick being plunged, and turned round as briſkly as may be, the water is neceſſarily put into a pretty rapid circular motion, and riſes to the very edge of the veſſel; and when there arrived, ceaſes to be further agitated.

The water thus raiſed, forms a cavity in the middle, whoſe figure is that of a truncated cone; its baſe is the ſame with the upper cavity of the veſſel; and its vertex in the axis of the cylinder.

What raiſes the water at the ſide of the veſſel, which occaſions the cavity in the middle, is its centrifugal force.— For the motion of the water being circular, it reſpects a centre taken in the axis of the veſſel; or, which is the ſame, in the axis of the *vortex* formed by the water; the ſame velocity, then, being impreſſed on all the water, the circumference of a ſmaller circle of water, or a circle leſs remote from the axis, has a greater centrifugal force than another that is greater, or more remote from the axis.— The ſmaller circle, therefore, drives the greater towards the ſide of the veſſel; and from this preſſion, or impulſion, which all the circles receives from the ſmaller ones that precede them, and convey to the greater which follow them, ariſes that elevation of the water along the edge of the veſſel to the very top, where we ſuppoſe the motion to ceaſe.

With a *vortex* thus formed, M. Saulmon, of the royal academy of ſciences, made divers experiments, by putting ſeveral ſolid bodies therein, to acquire the ſame circular motion; with intent to diſcover which of them, in making their revolutions round the axis of the *vortex*, approach toward, or recede from it, and with what velocity.— The reſult was, that the heavier the body, ſtill the greater was its receſs from the axis.

M. Saulmon's view in this attempt, was, to ſhew how the laws of mechanics produce the cœleſtial motions; and that it is probably to thoſe motions that the gravity or weight of bodies is owing.— But, unhappily, the experiments ſhew juſt the contrary of what they ſhould do, to confirm the Carteſian doctrine of gravity. See GRAVITY.

VORTEX, in the Carteſian philoſophy, is a ſyſtem or collection of particles of matter moving the ſame way, and round the ſame axis.

Such *vortices* are the grand machines whereby theſe philoſophers ſolve moſt of the motions, and other phænomena of the heavenly bodies.— Accordingly, the doctrine of theſe *vortices* makes a great part of the Carteſian philoſophy. See CARTESIANISM.

The matter of the world, they hold to have been divided at the beginning into innumerable little equal particles, each endowed with an equal degree of motion, both about its own centre and ſeparately, ſo as to conſtitute a fluid. See FLUID.

Several ſyſtems, or collections of this matter, they further hold to have been endowed with a common motion about certain points, as common centres, placed at equal diſtances; and that the matters moving round theſe, compoſed ſo many *vortices*.

Then, the primitive particles of the matter they ſuppoſe, by theſe inteſtine motions, to become, as it were, ground into ſpherical figures, and ſo to compoſe globules of divers magnitudes; which they call *the matter of the ſecond element:* and the particles rubbed, or ground off them, to bring them to that form, they call *the matter of the firſt element.* See ELEMENT.

And ſince there would be more of this firſt element than would ſuffice to fill all the vacuities between the globules of the ſecond, they ſuppoſe the remaining part to be driven towards the centre of the *vortex*, by the circular motion of the globules; and that being there amaſſed into a ſphere, it would produce a body like the ſun. See SUN.

This ſun being thus formed, and moving about its own axis with the common matter of the *vortex*, would neceſſarily throw out ſome parts of its matter, through the vacuities of the globules of the ſecond element conſtituting the *vortex*; and this eſpecially at ſuch places as are fartheſt from its poles; receiving, at the ſame time in, by theſe poles, as much as it loſes in its equatorial parts. And, by this means, it would be able to carry round with it thoſe globules that are neareſt, with the greater velocity; and the remoter, with leſs.— And, by this means, thoſe globules which are neareſt the centre of the ſun, muſt be ſmalleſt; becauſe, were they greater, or equal, they would, by reaſon of their velocity, have a greater centrifugal force, and recede from the centre. See LIGHT.

If it ſhould happen that any of theſe ſun-like bodies, in the centres of the ſeveral *vortices*, ſhould be ſo incruſtated, and weakened, as to be carried about in the *vortex* of the true ſun: if it were of leſs ſolidity, or had leſs motion than the globules towards the extremity of the *ſolar vortex*, it would deſcend towards the ſun, till it met with globules of the ſame ſolidity, and ſuſceptible of the ſame degree of motion with itſelf; and thus, being fixed there, it would be for ever after carried about by the motion of the *vortex*, without either approaching any nearer to, or receding from the ſun; and ſo become a planet. See PLANET.

Suppoſing then all this, we are next to imagine, that our ſyſtem was at firſt divided into ſeveral *vortices*, in the centre of each of which was a lucid ſpherical body; and that ſome of theſe being gradually incruſtated, were ſwallowed up by others which were larger, and more powerful, till at laſt they were all deſtroyed and ſwallowed up by the biggeſt *ſolar vortex*; except ſome few which were thrown off in right lines from one *vortex* to another, and ſo became comets. See COMET.

But this doctrine of *vortices*, is, at beſt, merely hypothetical. — It does not pretend to ſhew by what laws and means the cœleſtial motions are really effected, ſo much as by what means they poſſibly might, in caſe it ſhould have ſo pleaſed the Creator.— But we have another principle which accounts for the ſame phænomena as well, nay, better than that of *vortices*; and which we plainly find has an actual exiſtence in the nature of things: and this is *gravity*, or the weight of bodies. See GRAVITY.

The *vortices*, then, ſhould be caſt out of philoſophy, were it only that two different adequate cauſes of the ſame phænomena are inconſiſtent. See NEWTONIAN *Philoſophy*.

But we have other objections againſt it.— For, 1°. If the bodies of the planets and comets be carried round the ſun in *vortices*, the bodies of the parts of the *vortex* immediately inveſting them, muſt move with the ſame velocity, and in the ſame direction; and beſides, muſt have the ſame denſity, or the ſame vis inertiæ.— But it is evident, that the planets and comets move in the very ſame parts of the heavens with different velocity, and in different directions.— It follows, therefore, that thoſe parts of the *vortex* muſt revolve at the ſame time, in different directions, and with different velocities; ſince one velocity, and direction, will be required for the paſſage of the planets, and another for that of the comets.

2°. If it were granted, that ſeveral *vortices* are contained in the ſame ſpace, do penetrate each other, and revolve with divers motions; ſince thoſe motions muſt be conformable to thoſe of the bodies, which are perfectly regular, and performed in conic ſections; it may be aſked, How they ſhould have been preſerved intire ſo many ages, and not diſturbed, and confounded by the adverſe actions and ſhocks of ſo much matter as they meet withal?

3°. The number of comets is very great, and their motions perfectly regular, obſerving the ſame laws with the planets, and moving in conical orbits, that are exceedingly excentric. Accordingly they move every way, and to all parts of the heavens, freely pervading the planetary regions, and going frequently contrary to the order of the ſigns, which would be impoſſible, unleſs theſe *vortices* were away.

4°. If the planets move round the ſun in *vortices*, thoſe parts of the *vortices* next the planets, we have already obſerved, would be equally denſe with the planets themſelves; conſequently the *vortical* matter, contiguous to the perimeter of the earth's orbit, would be as denſe as the earth itſelf: and that between the orbits of the Earth and Saturn, muſt be as denſe, or denſer.— For a *vortex* cannot maintain itſelf, unleſs the more denſe parts be in the centre, and the leſs denſe towards the circumference: and ſince the periodical times of the planets are in a ſeſquialterate ratio of their diſtances from the ſun, the parts of the *vortex* muſt be in the ſame ratio.— Whence it follows, that the centrifugal forces of the parts will be reciprocally as the ſquares of the diſtances.— Such, therefore, as are at a greater diſtance from the centre, will endeavour to recede therefrom with the leſs force. Accordingly, if they be leſs denſe, they muſt give way to the greater force, whereby the parts nearer the centre endeavour to riſe.— Thus, the more denſe will riſe, and the leſs denſe deſcend; and thus there will be a change of places, till the whole fluid matter of the *vortex* be ſo adjuſted, as it may reſt in æquilibrio.

Thus will the greateſt part of the *vortex* without the earth's orbit, have a degree of denſity and inactivity, not leſs than that of the earth itſelf.— Whence the comets muſt meet with a very great reſiſtance, contrary to all appearances. Coteſ. *præf. ad Newt. Princip.* See COMET, RESISTANCE, MEDIUM, &c.

The doctrine of *vortices*, Sir Iſaac Newton obſerves, labours under many difficulties: for a planet to deſcribe areas proportional to the times, the periodical times of the *vortex* ſhould be in a duplicate ratio of their diſtances from the ſun; and for the periodical time of the planets to be a ſeſquiplicate proportion of their diſtances from the ſun, the periodical times of the parts of the *vortex* ſhould be in the ſame proportion of their diſtances: and, laſtly, for the leſſer *vortices* about Jupitur, Saturn, and the other planets, to be preſerved, and ſwim ſecurely in the ſun's *vortex*, the periodical times of the parts of the ſun's *vortex* ſhould be equal.— None of which proportions are found to obtain in the revolutions of the ſun, and planets around their axis. *Phil. nat. princ. math. apud ſchol. gen. in calce.*

Beſides, the planets, according to this hypotheſis, being carried about the ſun in ellipſes, and having the ſun in the umbilicus of each figure, by lines drawn from themſelves to the ſun, do always deſcribe areas proportionable to the times of their revolutions; which that author ſhews the parts of no *vortex* can do. *Scol. prop. ult. lib. 2 princip.*

Again, Dr. Keil proves, in his *Examination of Burnet's Theory*, that if the earth were carried in a *vortex*, it would move faſter in the proportion of three to two, when it is in Virgo, than when it is in Piſces; which all experience proves to be falſe.

VOTE, or VOICE. See SUFFRAGE, and VOICE.

In the houſe of peers, they give their *votes*, or ſuffrages, beginning at the puiſne, or loweſt baron, and ſo to the reſt ſeriatim, every one anſwering, apart, *content*, or *not content:* and if the affirmatives and negatives are equal, *ſemper præſumitur pro negante*; the ſpeaker having no caſting *vote*, unleſs he be a peer.

In the houſe of commons, they *vote* by *yea's* and *no's*, promiſcuouſly. See PARLIAMENT.

VOTIVE *Medals*, are thoſe whereon the vows of the people, for the emperors, or empreſſes, are expreſſed. See MEDAL, and VOW.

The public vows, made every five, ten, or twenty years, are more often found round the edges of medals, than on the faces thereof, at leaſt under the weſtern empire; for in the eaſtern the caſe is different: witneſs the medal of M. Aurelius the younger, where the reverſe repreſents the vows made at the time of his marriage, VOTA PUBLICA. And on Greek medals, ΔΗΜΟΥ ΕΥΧΑΙ, which they ſometimes expreſs by the two initial letters, Δ. Ε. according to F. Hardouin's conjecture, which may be admitted in certain medals, where the ΔΗΜ ΕΞ. that this, ΔΗΜΑΡΧΙΚΗΣ ΕΞΟΥΣΙΑΣ, does not well agree. Witneſs alſo the medal of Antonine, VOTA SUSCEPTA DECENNALIA.

The origin of *vows*, and *votive medals*, is given by M. Du Cange, thus:— Auguſtus feigning himſelf willing to quit the empire, and having twice, at the prayers of the ſenate, condeſcended to hold it for ten years longer, it grew into a cuſtom, to make freſh public prayers, ſacrifices, and games, for his continuing it, at the ten years end; and theſe they call *decennalia*, or *vota decennalia*. See DECENNALIA.

Under the eaſtern emperors, theſe vows were repeated every five years: hence it is, that, after Diocleſian's time, we find on medals VOTIS V. XV, *&c.* which practice continued till the time of Theodoſius, when Chriſtianity being well eſtabliſhed, a ceremony that had ſome remains of heatheniſm in it, was ſet aſide. So that the VOTIS MULTIS, on a medal of Majorianus, muſt be a very different thing; and no other, doubtleſs, than a kind of acclamation, like that PLURA NATALIA FAELICITER.

VOTIVE *Maſs*. See the article MASS.

VOTUM, VOW. See the article VOW.

VOTUM, in our antient law-books, is uſed for *nuptiæ*, or marriage: ſo, *dies votorum*, is the wedding-day, *Fleta*, lib. 4. cap. 2. par. 16. *Si donatarius ad alia vota convolaverit*, &c. See MARRIAGE.

VOUCH.— A perſon is ſaid to *vouch for another*, when he undertakes to maintain, or warrant him in any thing, or paſſes his word in his behalf. See VADARI, WAGER, &c.

In law, to *vouch*, is to call ſuch perſon, or *vouchee*, into court, to make good his warrant. See WARRANTY.

VOUCHEE, a perſon who is warranty, or *vouch* for another, who in reſpect hereof, is called *voucher*. See VOUCHER, and WARRANTY.

VOUCHER*, in law, the tenant in a writ of right, who calls another perſon into court, bound to warranty him, and either to defend his right againſt the demandant, or to yield him other lands, &c. to the value. See WARRANTY and VOUCHEE.

* This ſeems in ſome meaſure to agree to the contract in the civil law, whereby the vendee binds the vendor, ſometimes in the ſimple value of the things bought, ſometimes in the double, to warrant the ſecure enjoying of the thing bought. — Yet there is this difference between the civil and common law, in this point, that the civil law binds every man to warrant the ſecurity of that which he ſelleth; which the common law doth not, unleſs it be ſpecially covenanted. See ADVOWING.

The proceſs whereby the vouchee is called, is a *ſummoneas ad warrantiſandum*; and if the ſheriff return upon that writ, that the party hath nothing whereby he may be ſummoned, then goes out another writ, called, *ſequator ſub ſuo periculo*.

A recovery with a *ſingle voucher*, is when there is but one *voucher*; and with a *double voucher*, is when the vouchee voucheth over; and ſo a *treble voucher*. See RECOVERY.

There is alſo a *foreign voucher*, when the tenant impleaded in a particular juriſdiction, voucheth one to warranty in ſome other county, out of the juriſdiction of that court; and prays he may be ſummoned, &c.— This were more pertinently called a *voucher of a foreigner*.

VOUCHER, alſo ſignifies a leiger-book, or book of accompts, wherein are entered the warrants for the accomptant's diſcharge. See BOOK-KEEPING.

VOUSSOIR, *Vault-ſtone*, or *Key-ſtone*, in architecture, a ſtone proper to form the ſweep of an arch, being cut ſomewhat in manner of a truncated cone, whoſe ſides, were they prolonged, would terminate in a centre, to which all the ſtones of the vault are directed. See VAULT, ARCH, KEY, &c.

VOW, VOTUM, a ſolemn promiſe, or offering of a man's ſelf, or other thing to God. See OATH, OBLATION, &c.

A perſon is conſtituted a religious, by taking three *vows*, that of poverty, that of chaſtity, and that of obedience. See RELIGIOUS, MONK, &c.

Authors are divided as to the antiquity of theſe *vows*.— It is agreed, the antient anachorets, and hermits of the Thebaide made none; they did not conſecrate themſelves to God by an indiſſoluable obligation, but were at liberty to quit their retirement, and return into the world, whenever the fervor that drove them out of it, came to abate. See ANACHORET, &c.

Vows were not introduced till long after; and that to fix the too frequent inconſtancy of ſuch as, after retiring from the world, repreſented themſelves too ſoon, or too ſlightly; and by that means ſcandalized the church, and diſturbed the quiet of families by their return.

Eraſmus will have it, that ſolemn *vows* were not introduced till the thirteenth century, under the pontificate of Boniface VIII.— Others hold them as antient as the council of Calcedon: but the truth is, before Boniface VIII. there were none but ſimple *vows*, and ſuch as might be diſpenſed withal.— Their *vows*, till that time, were not deemed eternal chains; they were not indiſſoluble. It is true, they were obligatory promiſes, as to conſcience, and the inconſtancy of ſuch as violated them, was held an odious deſertion: but, as to law, the perſons were not held to be civilly dead, ſo as, upon their return, to render them incapable of all acts of civil ſociety.

The moſt common *vow* was that of poverty, but this only regarded the convent; on account of which, every perſon diveſted himſelf of all property: but the making of *vows* did not at all exclude them from the rights of blood, or render them incapable of inheriting.

No religious, it is true, acquired the property of the effects that fell to him; they all belonged to the monaſtery, in favour of which he had diveſted himſelf of every thing; and the monaſtery only left him the uſufruit and direction of them.— The popes have frequently confirmed this privilege to divers orders, and permitted the monks to inherit, as much as if they were ſeculars, and had made no *vows*.

At preſent, the civil death of a religious is dated from the day he makes the *vows*; and from that time he is utterly incapable of inheriting.— A religious may reclaim, or proteſt againſt his *vows* within five years; but after that, it is no longer admitted.— The failures in the profeſſion, are eſteemed to be purged, by his ſilence and perſeverance for five years.— Indeed, to be relieved from his *vows*, it is not enough the party reclaim within the five years; but he muſt likewiſe prove he was forced to take the habit.

VOWS, VOTA, among the Romans, ſignify ſacrifices, offerings, preſents, and prayers, made for the emperors and cæſars, particularly for their proſperity, and the laſtingneſs of their empire.

Theſe were, at firſt, made every five years, then every fifteen, and then every thirty, called *quinquennalia*, *decennalia*, and *vicennalia*. See DECENNALIA, VICENNALIA, and QUINQUENNALIA.

In divers antique medals and inſcriptions, we read, *Vot*. X. *Vot*. XX. *Vot. mult.* ſignifying *votis decennalibus*, *vicennalibus*, *multis*, &c. See VOTIVE.

VOWEL, VOCALIS, in grammar, a letter which affords a complete ſound of itſelf; or a letter ſo ſimple, as only to need a bare opening of the mouth to make it heard, and to form a diſtinct voice. See LETTER.

Such are *a*, *e*, *i*, *o*, *u*; which are called *vocales*, *vowels*, in contradiſtinction to certain other letters, which depending on a particular application of ſome part of the mouth, as the teeth, lips, or palate, can make no perfect ſound without an opening of the mouth, that is, without the addition of a *vowel*; and are therefore called *conſonants*. See CONSONANT.

Though we ordinarily only reckon five *vowels*, yet, beſides that each of theſe may be either long or ſhort, which occaſions a conſiderable variety in the ſound: to conſider only their differences reſulting from the different apertures of the mouth, one might add four or five more *vowels* to the number.— For the *e* open, and the *e* cloſe, are different enough to make two *vowels*, as in *ſea*, and *depth*; ſo alſo the *o* open, and *o* cloſe, in *hoſt*, and *organ*.— Add, that the *u* pronounced *ou*, as the Latins did, and as the Italians and Spaniards ſtill do, has a very different ſound from the *u*, as pronounced by the Greeks, and, as at this day, by the Engliſh and French.— Again, *eo*, in *people*, make but one ſimple ſound, though we write it with two *vowels*.

Laſtly, the *e* mute is, originally, no more than a ſurd joined to a conſonant, when that is to be pronounced without a *vowel*, as when it is immediately followed by other conſonants, as in the word *ſcamnum*.— This is what the Hebrews call *ſcheva*, eſpecially when it begins the ſyllable: and this *ſcheva* is found in all languages, though overlooked in many of them, particularly the Engliſh, Latin, &c. by reaſon it has no proper character to denote it; though, in ſome of the vulgar tongues, particularly French and High-Dutch, it is expreſſed by the *vowel e* adding its ſound to the reſt.

Thus, without regarding the differences of the ſame ſound or *vowel*, as to length or ſhortneſs, one may diſtinguiſh ten ſeveral *vowels*, expreſſed by the following characters, *a*, *e*, *ê*, *i*, *o*, *ô*, *eu*, *ou*, *u*, *e*, mute. See ALPHABET.

VOX, in law— VOCEM *non habere*, is a phraſe uſed by Bracton and Fleta, for an infamous perſon; one who is not admitted to be a witneſs. See INFAMOUS, VILLAINOUS, &c.

UP-LAND, denotes high ground, or, as ſome call it, *terra firma*: by which it ſtands oppoſed to ſuch as is mooriſh, marſhy, or low.— Or, it is paſture-land, which lies ſo high, as not to be overflowed with rivers, or land-floods. See GROUND.

UPPER *Hemiſphere*.	See the article	HEMISPHERE.
UPPER *Ocean*.		OCEAN.
UPPER *polar Dial*.		DIAL.
UPPER *Region*.		REGION.

UPRIGHT, in architecture, a repreſentation or draught of the front of a building; called alſo, an *elevation*, or *orthography*. See ELEVATION, ORTHOGRAPHY, PLAN, &c.

UPRIGHT, in heraldry, is uſed in reſpect of ſhell-fiſhes, as crevices, &c. when ſtanding erect in a coat.— Inaſmuch as they want fins, they cannot, according to Guillim, be properly ſaid to be *hauriant*; that being a term appropriated to ſcaly fiſhes.

URACHUS, ΟΥΡΑΧΟΣ, in anatomy, a membranous canal in a fœtus, proceeding from the bottom of the urinary bladder, through the navel, to the placenta, along with the umbilical veſſels, whereof it is eſteemed one.— See *Tab. Anat.* *(Splanch.) fig.* 1. *lit. ſ. ſ. fig.* 3. *lit. e. d. fig.* 8. *lit. n. fig.* 16. *lit. n.* ſee alſo the articles UMBILICAL *Veſſels*, and FOETUS.

The termination of the *urachus* in the placenta, forms a little oval veſica, or bladder, which ſerves to receive the urine ſecreted in the kidneys of the fœtus, and that could not make its way through the urethra, by reaſon of the reſiſtance of the ſphincter of the bladder, which is not to be overcome, but by inſpiration.

The humour found in the veſica of the *urachus*, is ſtill in the greater quantity, the higher coloured, and the more like urine, as the fœtus is nearer the time of the birth.

The *urachus* is not plainly found any where but in brutes; but there is no diſpute but that it exiſts in a human fœtus. See FOETUS.

M. Drelincourt, a celebrated profeſſor of anatomy at Leiden, and ſome others after him, deny the *urachus* to be hollow:

on which ſuppoſition it would not be eaſy to aſſign its uſe, unleſs to keep the bladder ſuſpended to the navel. But the former opinion ſeems the beſt warranted. See URINE.

URAN. See the article OURAN.

URANIBOURGH, a term often heard among aſtronomers, being the name of a celebrated obſervatory, in a caſtle in the little iſland Veena, or Huena, in the Sound; built by that noble Dane, Tycho Brahe, and furniſhed with inſtruments for obſerving the courſe and motions of the heavenly bodies. See OBSERVATORY.

This famed obſervatory, finiſhed about the year 1580, did not ſubſiſt above ſeventeen years; when Tycho, who little thought to have erected an edifice of ſo ſhort a duration, and who had even publiſhed the figure and poſition of the heavens, which he had choſe for the moment to lay the firſt ſtone in, was obliged to abandon his country.

Soon after this, thoſe to whom the property of the iſland Huena was given, made it their buſineſs to demoliſh *Uranibourgh:* part of the ruins were diſperſed into divers places, the reſt ſerved to build Tycho a handſome ſeat upon his antient eſtate, which, to this day, bears the name of *Uranibourgh.*— For as to the antient *Uranibourgh*, there is now no footſteps remaining.— It was here Tycho compoſed his catalogue of the ſtars. See CATALOGUE.

M. Picart, making a voyage to *Uranibourgh*, found Tycho's meridian line drawn thereon, to deviate from the meridian of the world; which confirms the conjecture of ſome, that the poſition of the meridian line may vary. See MERIDIAN.

URBICARY *Provinces.* See the article SUBURBICARY.

URDE', or URDE'E, in heraldry.— A *croſs urdé*, ſeems to be the ſame with what we otherwiſe call *clechée.* See CLECHE'.

UREDO, the blaſting or blighting of trees, or herbs. See BLIGHT, RUBIGO, DISEASES *of plants*, &c.

UREDO, is ſometimes uſed by phyſicians, for an itching, or burning in the ſkin. ITCH.

URENTIA, are ſometimes uſed for medicines of a hot or burning quality. See CAUSTIC.

URETERS*, ΟΥΡΗΤΗΡΕΣ, in anatomy, two long and ſlender canals, which come from the baſon of the kidneys, one on each ſide, and terminate in the bladder; ſerving to convey the urine, ſecreted in the glands of the kidneys, into the bladder.— See *Tab. Anat. (Splanch.) fig.* 1. *lit. g. g. fig.* 4. *lit. f. fig.* 8. *lit. m. m. fig.* 9. *lit. II.* ſee alſo the articles KIDNEY, BLADDER, and URINE.

* The word is formed from the Greek ουρειν, *meiere*, to make water.

The *ureters* lie between the doubling of the peritonæum; and deſcending in the form of an S, pierce the bladder near its neck, where they run, firſt, ſome ſpace betwixt its coats, and then open into its cavity.

They are compoſed of three coats.— The firſt is from the peritonæum; the ſecond is made of ſmall oblique muſcular fibres; and the third, which is very ſenſible, has ſeveral ſmall glands, which ſeparate a ſlimy liquor, to defend it againſt the acrimony of the urine.

The neighbouring parts furniſh them with blood-veſſels; and they have nerves from the intercoſtal, and the vertebræ of the loins.— Their cavity is ſometimes contracted in three or four places, eſpecially towards the bladder.

Such as are ſubject to the gravel, and given to exceſſive drinking, have them ſometimes ſo much dilated, that one may put the end of ones little finger into them. See STONE, and GRAVEL.— Their obſtruction cauſes a ſuppreſſion of the urine. See URINE.

URETHRA, ΟΥΡΗΘΡΑ, in anatomy, a tube or canal ariſing from the neck of the bladder, and continued to the pudendum; ſerving to diſcharge, or carry off the urine out of the bladder. See *Tab. Anat. (Splanch.) fig.* 8. *lit. u. u. fig.* 15. *lit. d. f. m. m.* ſee alſo URINE.

Some will have it to be only a production of the neck of the bladder itſelf.— Its length is very different in the two ſexes. — In man it terminates in the extremity of the glans, and is ordinarily a foot long.— In women, where it is uſually called *meatus urinarius*, it is but two fingers breadth long, and terminates in the vulva; but it is much wider, and more eaſily dilated here, than in the other ſex. See PENIS, and MEATUS.

Mr. Cowper gives us an inſtance of a woman, wherein the hymen was ſo firm and impervious, that her huſband finding no paſſage through it, had opened himſelf another through the orifice of the *urethra.* See HYMEN.

The *urethra* is compoſed of two membranes, and a little ſpongy ſubſtance, like that of the corpora cavernoſa; except at the end which joins the neck of the bladder; where the diſtance between the membranes is ſmall, and filled up with a thin and red glandulous ſubſtance, whoſe excretory ducts, piercing the inner membrane, pour into the pipe a mucilaginous liquor, which lines and lubricates its cavity, and prevents the ſalts of the urine from galling it; as having a farther office in the male ſex, *viz.* the emiſſion of the ſeed. See SEED, CAVERNOSUM, and MUCUS.

URIGO, a burning with a cauſtic, or cautery. See CAUSTIC, CAUTERY, and BURN.

URIM *and Thummim*, אורים תמים q. d. *light and perfection*, the name of a kind of ornament belonging to the habit of the Jewiſh high-prieſt; in virtue whereof he gave oracular anſwers to the people. See PROPHECY, &c.

The high-prieſts of the Jews, we are told, conſulted God in the moſt important affairs of their commonwealth, and received anſwers by the *urim and thummim.*— What theſe were is diſputed among the critics: ſome take them to be the 12 precious ſtones in the breaſt-plate of the high-prieſt, which ſhone like a flame of fire. See RATIONALE.

Others will have them, the theraphim, or little human figures carried by the high-prieſt, hid in the fold of his robe or gown, and by which he anſwered the queſtions of the Jews. See THERAPHIM.

Diodorus Siculus relates, that there was a like ceremony in uſe among the Egyptians, whoſe principal miniſter of juſtice wore a collar of precious ſtones about his neck, which was called αληθεια, truth.

URINAL, in medicine, a veſſel fit to receive and hold urine; and uſed accordingly, for the conveniency of ſick perſons. See URINE, and UROCRITERIUM.

It is uſually of glaſs, and crooked; and ſometimes filled with milk, to aſſuage the pain of the gravel.

URINARIA *Fiſtula*, is the ſame as *urethra*; ſo called from its office, to convey the urine. See URETHRA.

Veſica URINARIA. See the article BLADDER.

Meatus URINARIUS. See the article MEATUS.

URINARY *Bladder.* } See the article { BLADDER.
URINARY *Paſſage.* } See the article { URETHRA.

URINE*, URINA, a liquid excrement, or humour, ſeparated from the blood in the kidneys, conveyed thence into the bladder, and diſcharged by the urethra. See EXCREMENT.

* The word is formed from the Greek, ουρον, which ſignifies the ſame.

The *urine* is ſecreted from the arterial blood, in the glands of the kidneys; from which ariſe numerous little pellucid pipes and veins; which, receiving the ſecreted *urine*, at length join into twelve papillæ; out of which the *urine* oozes into a cavity called the *pelvis*, from whence it runs into the ureters of either ſide, and through them into the bladder; and from that, at length, through the urethra, out of the body. See KIDNEYS, PAPILLÆ, PELVIS, URETER, BLADDER, and URETHRA.

The ſecretion of the *urine*, then, it not performed by any attraction, as ſome will have it; or by any emulſion, as others; or any fermentation, as others; or any precipitation, as others: but by the force of the heart, and arteries, whereby the blood is driven through innumerable turnings and windings of the veſſels; attenuated by reſiſtances, oppoſite motions, violent concuſſions, and various mixtures, till the more liquid and ſerous part thereof is forced through canals ſmaller than the blood-veſſels, and ſo collected and diſcharged. See SECRETION.

It is more than probable, that the blood of the emulgent artery, conveyed through all the little branches that ſpread through the exterior membranes of the veſiculæ whereof the kidneys are compoſed, being by this means exceedingly divided, and, as it were, attenuated, enters the veſiculæ themſelves, and gives them their red colour; that it is there filtrated, and the ſerous or *urinous* part ſecreted; that this filtration is promoted by the alternate contraction and dilatation of the fleſhy fibres that incloſe the little veſicles; and that after filtration, the parts that remain blood are reſumed by the capillary branches of the veins; the reſt entering the excretory ducts of the veſiculæ, which are the firſt receptacle of the *urine. Hiſt. Acad. des Sciences*, Anno 1705.

M. Morin, in the *Memoirs of the Academy of Sciences*, marks out a new rout, or courſe for the *urine.*— The ordinary one, which is the paſſage of any liquor we drink through the ſtomach into the inteſtines, thence into the lacteals, thence into the receptacle of the chyle, thence into the ſubclavian vein, thence into the cava, thence into the right ventricle of the heart, thence into the lungs, and thence into the left ventricle of the heart; thence into the aorta, thence into the emulgent artery, thence into the kidneys, thence into the ureters, and at laſt into the bladder, ſeems too long and circuitous; conſidering how readily mineral waters paſs, and what a ſpeedy effect aſparagus is found to have on our *urine.*— Beſides, that on this principle, the liquors we drink mixing with ſo many other liquors in their way, ſhould be greatly altered thereby; whereas we frequently find a tincture of caſſia, rendered by *urine* almoſt as black as when firſt taken: and the like is obſerved of divers other liquors.

M. Morin therefore, maintains, that a good part of the liquor we drink, oozes through the membranes of the ſtomach, and falls into the pelvis; where it enters the bladder through the pores thereof, without getting into the inteſtines, which are lined with too thick and viſcid a humour to allow it ingreſs.

This ſyſtem is confirmed hence, that both the ſtomach and bladder, even of a dead animal, are found eaſily permeable to water.

Accordingly, Dr. Morgan aſſures us, that if the contents of the abdomen be taken out of an animal body, after it is juſt opened, and the ſtomach be filled with warm water, while the parts are yet reaking, the liquor will paſs into the bladder; which will viſibly receive it, and be filled in proportion as the ſtomach empties.

The ſame author adds, that if a ligature be made upon the ureters, while the animal is yet living, and the blood continues to circulate; though this muſt cut off all communication from the kidneys to the bladder; yet any liquor, with which the ſtomach is filled, will paſs into the bladder.

From the whole, though ſome of our beſt anatomiſts hold that a circulation of the whole maſs of blood is effected in five minutes, and others in two, which might account for the quick paſſage of the *urine*, it is hard to conceive, but that part of it muſt go immediately from the ſtomach into the bladder.

The general deſign of nature in this new *urinary* drain, is ſuppoſed to be to prevent any ſudden plethora, or immoderate diſtenſion of the veſſels upon drinking. See DRINK, *&c.*

As a neceſſary conſequence of this ſyſtem, the author eſtabliſhes two kinds of *urine*; the one filtrated immediately out of the ſtomach into the bladder, the other paſſing the long courſe of circulation.

In the *Philoſophical Tranſactions*, we have an inſtance given us, by Mr. Young, of a boy ſix years old, that piſſed off almoſt all his *urine* by his navel.

In the ſame *Tranſactions*, Dr. Richardſon gives an account of a boy at North Bierly in Yorkſhire, who lived to ſeventeen years of age without ever making water; yet was in perfect health.— He had conſtantly a diarrhœa on him, but without much uneaſineſs. The obſtruction, that author obſerves, muſt have been in his kidneys; for he had never any inclination to make water.

Urines are of various kinds and properties.— After drinking plentifully of any aqueous fluid, the *urine* is crude, inſipid, void of ſmell, and eaſily retained.— That yielded by chyle well concocted, is ſharper, more ſaline, leſs copious, ſomewhat feted, and more ſtimulating.— That from chyle already converted into ſerum, is redder, ſharper, ſalter, and more fetid and ſtimulating.— And that ſecerned after long abſtinence, from humours well concocted, and worn off the ſolid parts, is the leaſt copious, ſharpeſt, ſalteſt, reddeſt, moſt fetid, almoſt putrified, and of all others the hardeſt to retain.

The *urine*, therefore, contains the watery part of the blood, its ſharpeſt, ſubtileſt, and moſt volatile ſalt, and that neareſt to the alkaline kind; its ſharpeſt, ſmalleſt, and moſt volatile oil, and that neareſt to putrefaction; and its ſmalleſt moſt volatile earth. See BLOOD.

The ſal armoniac of the antients was prepared from camels *urine*. See ARMONIAC.— And the phoſphorus, in uſe among us, from human *urine*. See PHOSPHORUS.— Saltpetre is likewiſe prepared from the *urine*, and other excrements of animals. See SALT-PETRE.

The Indians ſcarce uſe any other medicine but cows *urine*.— The Spaniards make great uſe of *urine* to clean their teeth withal: ſo did the Celtiberians of old.

Urine is alſo uſed in dying, to ferment and warm the woad. —Old *urine* tinges ſilver with a fine gold colour. See DYING.

The diſorders in the *urine* are various. See STRANGURY, RETENTION, DIABETES, STONE, NUBECULA, *&c.*

URINE, in medicine.— The *urine* affords one of the principal criterions, or ſigns, whereby phyſicians judge of the ſtate of the patient, and the courſe of the diſeaſe. See SIGN, SYMPTOM, DISEASE, *&c.*

In caſting, or examining *urine*, the things to be conſidered are its *quantity*, *colour*, *ſmell*, *taſte*, *fluidity*, and the matters ſwimming therein.

An *abundance of urine*, indicates a looſeneſs of the renal pipes, a diminution of perſpiration, ſweat, ſaliva, an imperfect mixture of the blood, whereby the watry parts ſeparate eaſily from the reſt; a nervous indiſpoſition, a copious drinking of ſome aqueous liquid, or ſome diuretic taken.— Such *urine* preſages a thickneſs of what is left behind, and its acrimony; thirſt, anxiety, obſtructions, and their effects, a dry, thirſty, hot conſumption.

A contrary ſtate of the *urine*, indicates the contraries; and preſages future repletions, heavineſs, drouſineſs, convulſive tremors, *&c.*

A *thin*, *limpid*, *inſipid*, *colourleſs*, *taſteleſs urine*, denotes a great conſtriction of the renal veſſels, and, at the ſame time, a briſk agitation of the humours; a ſtrong coheſion of the oil, ſalt, and earth in the blood itſelf, and an imperfect mixture of the aqueous parts therewith; ſome grievous indiſpoſition of the mind, a hyſteric or hypochondriac fit; a debility of the viſcera; crudity, pituita, obſtructions of the veſſels; and, in acute diſeaſes, a want of a coction and criſis.— Such *urine* portends much the ſame as a too copious *urine*; and, in acute inflammatory diſeaſes, a bad condition of the viſcera, deliria, phrenſies, convulſions, death.

Ruddy urine, without any ſediment, in acute diſeaſes, indicates a violent motion and attrition among the parts that conſtitute the humours, and between the veſſels and the humours; a cloſe intimate mixture of the oil, ſalt, earth, and water in the humours: and hence a great crudity of the diſeaſe, and its long duration, and great danger.— Such *urine* preſages gangrenous obſtructions of the fineſt veſſels, chiefly thoſe of the brain and cerebel, and thence death: a difficult coction; a ſlow, doubtful criſis: and all theſe the worſe, as the *urine* is redder, and freer of ſediment.— If there be a heavy, copious ſediment, it ſhews a ſtrong antecedent attrition, looſe veſſels, ſharp, ſaline, colliquated blood, unfit for nutrition, intermitting fevers, and ſcurvy.

The preſages are, the durableneſs of the diſeaſe, wearing of the veſſels, weakneſs, colliquative ſweats, ſaliva, atrophy, and dropſy.— If the ſediment in ſuch *urine* be branny, ſcaly, filmy, *&c.* it preſages the like, only worſe.

A *yellow urine*, with a ſediment as before, denotes a jaundice, and the ſymptoms thereof in the cutis, ſtools, hypochondriums, *&c.*

A *green urine*, with a thick ſediment, denotes an atrabilary temperature, and that the matter thereof is reſolved, and now excreted: conſequently anxieties about the præcordia, perturbations of ſtool, iliac and colic pains.

Black urine, denotes the ſame with green, only in a greater and worſe degree.

Blood, pus, caruncles, filaments, hairs, anguillæ, grumæ, ſand, parts of ſtone, and a mucus at the bottom of the *urine*, denote ſome diſorder in the kidneys, ureters, bladder, teſticles, ſeminal veſicles, proſtatæ, and urethra.

Fatty urine, generally breeds ſmall ſands, adhering to ſome viſcid matter, and thus produces a ſort of oily membrane, or pellicle, which denotes an abundance of earth, and a heavy ſalt in the blood, and preſages the ſcurvy, ſtone, *&c.*

A *fetid urine*, denotes the ſalts and oils to be attenuated, diſſolved, and almoſt putrified; whence very great danger, both in chronic and acute diſeaſes.

Urine which, when ſhook, retains its froth long, denotes a tenacity of the mixture, and thence a difficulty of criſis; and pulmonic diſeaſes, or catarrhs in a head.

But the *urine* is chiefly conſulted in acute fevers, where it is a very ſure ſign: For, 1°. *Urine* with a white, light, equable, turbinated, inodorous ſediment, through the whole courſe of the diſeaſe to the criſis, is a very good preſage.— 2°. Copious, white, ſtrangurious *urine*, with much white ſediment, emitted at the time of the criſis, cures and takes away abſceſſes. 3°. A thin, ruddy *urine*, that does not ſubſide a white, thin, watery *urine*; a thin, equable, yellow *urine*; a turbid *urine*, that does not ſubſide, denotes, in very acute diſeaſes, a great crudity, a difficult criſis, and a durable dangerous diſeaſe.

URINE, in agriculture, is of excellent uſe as a manure. See MANURING.

The knowing in agriculture and gardening, prefer *urine* for land, trees, *&c.* before dung; as penetrating better to the roots; and removing divers infirmities of plants.

The decay of the antient Kentiſh pippins, is a thing much complained of; and Mr. Mortimer obſerves, they will be quite loſt, unleſs ſome perſons ſet themſelves to the antient way of culture; which, as all antient graziers and gardeners know, was by waſhing the moſſy, worm-eaten, cankered, and unſound trees, two or three time in the month of March, with the *urine* of oxen, *&c.* gathered in earthen veſſels, placed under the planks of the ſtalls wherein they were fatted.

In Holland, and in divers other parts, they preſerve the *urine* of their beaſts, *&c.* with as much care as their dung.— Mr. Hartlib, Sir Hugh Plat, Mr. Mortimer, *&c.* make a common complaint, that ſo great an improver of land, and ſo remarkable a ſtrengthener of manure, ſhould be ſo much diſregarded among us.

URINOUS *Salts*, are the ſame with what we otherwiſe call *alkali ſalts*, or *alkalies*. See ALKALI.

There are two kinds of *urinous ſalts*, the one *fixt*, the other *volatile*.— The fixt prevail in plants, and the volatile in animals. See SALT, FIXT, and VOLATILE.

They are called *urinous*, in reſpect of their taſte, and ſmell, which bear ſome reſemblance to thoſe of urine.

URN, URNA, a kind of vaſe, of a roundiſh form, but biggeſt in the middle, like the common pitchers; now ſeldom uſed, but in the way of ornament over chimney-pieces, in buffets, *&c.* or, by way of acroters, a-top of buildings, funeral monuments, *&c.* See VASE, and ACROTER.

The great uſe of *urns*, among the antients, was to preſerve the aſhes of the dead, after they were burnt: for which reaſon they were called *cineraria*, and *urnæ cineraria*; and were placed ſometimes under the tomb-ſtone, whereon the epitaph was cut; and ſometimes preſerved in vaults in their own houſes. See Sepulchre, Tomb, and Funeral.

Urns were alſo uſed at their ſacrifices, to put liquid things in. See Sacrifice.— They were alſo of uſe in the *ſortes præneſtinæ*, or caſting of lots. See Sortes.

At Rome, too, the cuſtom was to abſolve or condemn the accuſed, by the ſuffrages, or calculi, which the judges caſt into the *judicatory urn.* See Absolution, *&c.*

Virgil repreſents Minos the judge of hell, ſhaking the *urn*, to decide the lots of mankind — *Quæſitor Minos* urnam *movet.*

The *urn* is ſtill the attribute of rivers, which are painted leaning on *urns*, repreſenting their ſources by the waters flowing therefrom.— We find them repreſented in the ſame manner on antique medals, and relievo's. See River, and Attribute.

Urn, Urna, was alſo a Roman meaſure, for liquid things; containing about three gallons and a half of Engliſh wine-meaſure. See Measure.

The *urn* was half the amphora, and four times the congius. See Amphora.

UROCRITERIUM*, or **Urocrisia**, a *caſting of water*; or giving judgment on diſeaſes by the ſight of the urine. See Urine.

* The word is compounded of ȣρον, urine, and κριτηριον, criterion, mark, ſign.— Hence alſo, *uromancy*, *uroſcopy*, &c.

URSA, in aſtronomy, *the Bear*, a name common to two conſtellations of the northern hemiſphere, near the pole; diſtinguiſhed by *major*, and *minor*. See Constellation.

Ursa *major*, or *the great bear*, according to Ptolemy's catalogue, conſiſts of 35 ſtars; according to Tycho's, of 56; but, in the Britannic catalogue, we have 215.— The longitudes, latitudes, magnitudes, *&c.* whereof, are as follow.

URSULINES, an order of nuns, who obſerve the rule of S. Auguſtin; and are chiefly noted for taking on them the education, and inſtruction of young maids. See Order, and Religious.

They take their name from their inſtitutreſs S. Urſula; and are cloathed in white, or black.— The *Urſulines* have ſpread exceedingly in France, &c. within theſe few years.— Few maids but are put out to ſchool to them.

USAGE, in law } See { Prescription, and Custom.
Usage, in language. } See { Language.

USANCE, Uſo, in commerce, is a determinate time for the payment of bills of exchange, reckoned either from the day of the bills being accepted, or from the day of their date; and thus called, becauſe regulated by the uſage and cuſtom of the places whereon they are drawn. See Bill, and Exchange.

Bills of exchange, are drawn at one or more *uſances*, either from ſight, or from date.— The Italians ſay *uſo doppio*, for *double uſance*, or *two uſances*.

This term is longer or ſhorter, according to the different countries.— In France *uſance* is fixed at thirty days.— At London, *uſance* is a calendar month; and *double uſance*, two months.— In Spain, *uſance* is two months, or ſixty days.— At Venice, Genoa, and Leghorn, three months.

At Hamburgh, *uſance* of bills drawn from England, France, and Venice, is two months after date.— From Antwerp, and Nuremberg, fifteen days after ſight.

At Venice, *uſance* of bills drawn at Ferrara, Bologna, Florence, Lucca, and Leghorn, is five days after ſight.— From Naples, Auſbourg, Genoa, and Vienna, fifteen days after ſight.— From Mantua, Modena, and Milan, twenty days after date.— From Amſterdam, Antwerp, and Hamburgh, two months after date; and from London, three months after date.

At Milan, *uſance* of bills drawn from Genoa, is eight days after ſight.— From Rome, ten days after ſight. And from Venice, twenty days after date.

At Florence, *uſance* of bills drawn from Bologna, is three days after ſight.— From Rome, ten days after ſight.— From Venice and Naples, twenty days after date.

At Rome, *uſance* of bills of exchange drawn in Italy, was, originally, ten days after ſight; but, by an abuſe, this term has been extended to fifteen.

At Leghorn, *uſance* of bills drawn from Genoa, is eight days after ſight: from Rome, ten days; from Naples, three weeks: from Venice, twenty days after date: from London, three weeks; and from Amſterdam, forty days.

At Amſterdam, *uſance* of bills drawn from England and France, is a month after date: from Venice, and Madrid, Cadix, and Sevil, two months.

At Genoa, *uſance* of bills from Milan, Florence, Leghorn, and Lucca, is eight days after ſight: from Venice, Rome, and Bologna, fifteen days: from Naples, twenty two days: from Sicily, a month after ſight, or two months after date: from Sardinia, a month after ſight: from Antwerp, Amſterdam, and other places in the Low Countries, three months after date.

USE, Usus, in law, denotes the benefit or profit of lands, and tenements. See Usufruit.

Uſe imports a truſt and confidence repoſed in a man for the holding of lands; that he to whoſe uſe or benefit the truſt is intended, ſhall reap the benefits thereof.

A deed conſiſts of two principal parts: the *premiſes*, which include all that comes before the habendum, or limitation of the eſtate; and the *conſequent*, which is the habendum itſelf;

wherein are two limitations: the one of the *eſtate*, or property the party ſhall receive by the deed.—The other of the *uſe*, expreſſing to, or for what *uſe* and benefit he ſhall have the ſame. See DEED.

Uſes, ſay ſome, were invented upon the ſtat. of Weſtminſter, *quia emptores terrarum*: before which time, no ſuch *uſes* were known.—And becauſe, in courſe of time, many deceits got footing, by ſettling the poſſeſſion in one man, and the *uſe* in another; it was enacted, anno 27 Hen. VIII. That the *uſe* and poſſeſſion of lands ſhould ſtand united, or that the poſſeſſion ſhould be given to him who had the *uſe*.

USE *and Cuſtom*, in antient law-books, denotes the ordinary method of acting or proceeding in any caſe, which, by length of time, has obtained the force of law. See CUSTOM, PRESCRIPTION, LAW, &c.

Ceſtui qui USE. } See the article { CESTUI.
Contingent USE. } { CONTINGENT.

USER *de Action*, in law, is the purſuing, or bringing an action, in the proper county, *&c.* See ACTION, PROCESS, &c.

USES *and Cuſtoms of the ſea*, are certain maxims, rules, or *uſages*, which make the baſe or ground-work of the maritime juriſprudence; by which the policy of navigation, and commerce of the ſea, are regulated. See NAVIGATION, COMMERCE, &c.

Theſe *uſes* and cuſtoms conſiſt in three kinds of regulations.—The firſt, called *laws*, or *judgments of Oleron*, were made by order of queen Eleanor, dutcheſs of Guienne, at her return from the holy war; and that chiefly from memoirs which ſhe had gathered in the Levant, where commerce was at that time in a very flouriſhing condition.

She called them *rolls of Oleron*, by reaſon ſhe then reſided in an iſland of that name, in the bay of Aquitaine.—They were much augmented about the year 1266, by her ſon Richard, king of England, on his return from the Holy Land.

The ſecond regulations were made by the merchants of Wiſbuy, a city in the iſland of Gothland, in the Baltic, antiently much famed for commerce, moſt of the nations of Europe having their quarters, magazines, and ſhops therein.

Theſe were compiled in the Teutonic language, and are ſtill the rule in the northern countries. Their date does not appear; but it is probable they were made ſince the year 1288, that the city of Wiſbuy was deſtroyed the firſt time, afterwards reſtored by Magnus, king of Sweden.

The third ſet of regulations were made at Lubec, about the year 1597, by the deputies of the Hanſe towns. See HANSE.

USHER, *Huiſſier*, ſignifies an officer, or ſervant, who has the care and direction of the door of a court, hall, chamber, or the like.

In the king's houſhold there are two *gentlemen-uſhers* of the privy-chamber, appointed to attend the door, give entrance, *&c.* to perſons that have admittance thither.—Four *gentlemen-uſhers*, waiters; and an aſſiſtant *gentleman-uſher*.—Eight *gentlemen-uſhers*, quarter-waiters in ordinary.

In the French court there are two *uſhers* of the anti-chamber, or hall where the king dines in public.—They wait ſword by ſide, all the year, and open the door to ſuch as are to come in.—There are above ſixteen *uſhers* of the chamber, two of the cabinet, and one of the order of the Holy Ghoſt.

The *uſhers* of the inquiſition in Spain and Portugal, are perſons of the prime quality, who think themſelves highly honoured, by only looking to the doors of the ſacred tribunal. See INQUISITION.

USHER, is alſo uſed for an officer in the Exchequer; of which ſort, three or four attend the chief officers and barons, at the court at Weſtminſter, and juries, ſheriffs, and other accomptants, at the pleaſure of court. See EXCHEQUER.

USHER *of the black-rod*. See the article BLACK-*Rod*.

In a chapter held at Whitehall, 13 Car. II. it was ordained that this office ſhould be fixed to one of the *gentlemen-uſhers* daily waiters at court; the eldeſt of which always holds the place; and is called *gentleman-uſher*, and *black-rod*. See GARTER.

In relation to the order of the garter, he is appointed to carry the rod at the feaſt of S. George, and other ſolemnities, which he makes uſe of as an authority to attach delinquents, who have offended againſt the ſtatutes of the order, which he frequently doth by touching them therewith.—He wears a gold badge, embelliſhed with the enſigns of the order.—He has an houſe in Windſor-caſtle, and other privileges.

USNEA, in natural hiſtory, *muſcus arboreus*; a ſort of plant of the paraſite or moſs kind, growing like a great beard on the oak, cedar, and divers other trees. See MOSS, and PARASITE.

USNEA *Humana*, is a ſmall greeniſh moſs, growing on human ſkulls, that have lain a long time expoſed to the air.

It is very aſtringent, and held proper to ſtop hæmorrhages.—It is alſo an ingredient in the weapon-ſalve of Paracelſus, and Crollius.

USQUEBAUGH, a ſtrong, rich, compound liquor, chiefly taken by way of dram; its baſis being brandy, or rectified ſpirits of wine.

The proceſs is ſomewhat various, and the ingredients numerous.—We ſhall give one much commended formerly, as a ſpecimen.

To two gallons of brandy, or ſpirits, put a pound of ſpaniſh liquorice, half a pound of raiſins of the ſun, four ounces of currants; three of dates ſliced; tops of thyme, bawm, ſavory, and mint, and tops or flowers of roſemary, of each two ounces; cinnamon and mace bruiſed, nutmegs, anis ſeeds and coriander ſeeds, bruiſed likewiſe, of each four ounces; citron, or lemon and orange peel, ſcraped, of each an ounce.

All theſe to be left to infuſe 48 hours in a warm place, often ſhaking them together: then ſet them in a cool place, for a week; after which the clear liquor is to be decanted off, and to it an equal quantity of neat white port-wine, and a gallon of canary, are to be added.—The whole to be ſweetned with a proper quantity of double refined ſugar.

USTION*, USTIO, in pharmacy, the preparing of certain ſubſtances, by burning them.

* The word is formed from the Latin *urere*, to burn.

The antients made uſe of the *uſtion* of horns, nails, feathers, and other parts of animals, for divers remedies: and the moderns ſtill uſe æs uſtum, which is burnt copper, or copper that has undergone the *uſtion*, with ſulphur. See ÆS USTUM.

The *uſtion* of minerals, is a more imperfect kind of calcination. See CALCINATION.—It is a degree beyond torrefaction. See TORREFACTION.

USTUM *Æs*. See the article ÆS USTUM.

USUCAPTION, USUCAPTIO, in the civil law, is an acquiſition of the property of a thing, by a poſſeſſion and enjoyment thereof for a certain term of years preſcribed by law. See POSSESSION.

Some make a difference between *preſcription* and *uſucaption*, maintaining, that the latter is only uſed with regard to moveables, and the former with regard to immoveables.—But there is no eſſential difference between them; and accordingly, preſcription and *uſucaption*, are generally held ſynonyma's. See PRESCRIPTION.

USUFRUIT, USUS-FRUCTUS, in the civil law, the uſe or enjoyment, of any lands or tenements: or the right of receiving the fruits and profits of an inheritance, or other thing, without a power of alienating, or changing the property thereof. See USE, and POSSESSION.

When the *uſufructuary* dies, the *uſufruit* returns to the proprietor.—The dower to the jointure of a widow, is only an *uſufructuary* due; that is, ſhe only enjoys the *uſufruit* thereof, and cannot diſpoſe of the principal. See DOWER.

All mutual preſents between man and wife, only import the *uſufruit* of the goods of the firſt that dies, to the profit of the ſurvivor.—The incumbents of benefices are only *uſufructuary*. See BENEFICE.—An *uſufructuary* has full right over the coppice; but cannot fell timber-trees.

USURER, a perſon charged with a habit or act of *uſury*. See USURY.

The laws of our antient Saxon and Norman kings, are very ſevere upon *uſurers*, or letters-out of money upon intereſt.—*Uſurarios quoque defendit rex Edvardus* (confeſſor) *ne remaneret aliquis in toto regno ſuo; & ſi quis inde convictus eſſet, quod fœnus exigerat, omni ſubſtantia propria careret & poſtea pro exlege habeatur: quoniam* uſura *radix omnium malorum.* Leg. Edv. Confeſſ. cap. 37.

They were indeed allowed to diſpoſe of their goods before conviction, and whilſt they were living; but after their death they were confiſcate, if it could be proved they lent money to *uſe* within a year before their death. *Matt. Paris.*

If a clergyman were an *uſurer*, his goods were not to be confiſcated; but to be diſtributed to pious uſes.—In thoſe days *uſury* was thus defined:

Eſt uſura *ſuos quiſquis tradit mihi nummos*
Spe lucri, fœnus duplex uſura *vocatur.*

USURIOUS *Contract*, is any bargain or contract, whereby a man is obliged to pay more intereſt for money than the ſtatute allows. See INTEREST, CONTRACT, and USURY.

USURPATION, in law, is an injurious uſing, or enjoyment of a thing for continuance of time, that belongs of right to another. See USUCAPTION, and POSSESSION.

USURY, USURA, in the general, denotes a gain or profit, which a perſon makes of his money, by lending the ſame; or it is an increaſe of the principal, exacted for the loan thereof; or the price a borrower gives for the *uſe* of a ſum credited to him by the lender: called alſo *intereſt*, and, in ſome antient ſtatutes, *dry exchange*. See INTEREST, and EXCHANGE.

The word *uſury* is uſually taken in an evil ſenſe, *viz.* for an unlawful profit which a perſon makes of his money; in which ſenſe it is, that *uſury* is forbidden by the civil and eccleſiaſtical law, and even by the law of nature: in this ſenſe it alſo is, that it is held *uſury* to lend money on pawns, to exact intereſt for money, without ſurrendering the principal, and to ſtipulate intereſt for money which is not employed in trade, nor brings any profit to the perſon who receives it:

but as the Latin word *uſura*, at leaſt the plural thereof, *uſuræ*, may be underſtood of a lawful intereſt, we do not ſee why *uſury* may not be uſed in Engliſh, in the ſame harmleſs ſenſe.

By the antient Roman law, people were allowed to lend out their money at one *per cent. per* month; which was 12 *per cent. per annum.*— If they received more, they incurred the note of infamy, and the overplus was charged on the principal.

This rate of *uſury* was allowed of, as low as the time of Juſtinian, who moderated it a little by the 26th law in the code, *de uſuris.* And not long after, the canon law forbid all ſort of *uſury* whatever.— In compliance with this prohibition, the cuſtomary laws do not allow any intereſt to be exacted, for money lent on a ſimple promiſe or obligation; but only by contract, and upon alienating the principal, which the debtor is to reimburſe at pleaſure: which is a kind of buying an annuity, or annual revenue.

So that in propriety, *unlawful uſury* conſiſts, in extorting an exceſſive rate for one's money, beyond what is preſcribed by law. See RATE.

Du Moulin, indeed, makes *uſury*, taken in the ill ſenſe, to be a profit exacted for a loan made to a perſon in want; intimating, that it is unlawful to extort gain, from the aſſiſtance given to the unhappy, or to convert an office of humanity into a mercenary one.— The reaſon is, that money is a barren and fruitleſs thing, in the hands of a perſon whom neceſſity obliges to borrow; and that being lent him to be ſpent, he can make no advantage of it: whereas the principal pretext for requiring lawful intereſt is, that the perſon who lends, may ſhare in the profits thereof, with the perſon to whom it is lent.

Notwithſtanding, moſt of the antient canoniſts inſiſt on a rigorous obſervation of that precept in Deuteronomy, *Non fæneraberis fratri tuo*, Thou ſhalt not lend money to thy brother on *uſury:* and plead, that nothing is to be required further than the principal.

However, in life, we call nothing *uſury*, but what exceeds the bounds preſcribed by the laws: ſo that when a perſon does not alienate his principal, or takes intereſt beyond what is limited by ſtatute, theſe alone are *uſury*.

By the ſtat. 12 Car. I. no man is allowed to take above ſix pounds, for the forbearance of one hundred pounds for one year, under certain penalties therein enjoined.— And by a later ſtat. 12 Annæ, no man may take above five pounds for the like occaſion; and in proportion for any other ſum.

UT, a Latin term, ſignifying, literally, *as*; much uſed in the ſtating of ratios and proportions. See RATIO, and PROPORTION.

Sir Iſaac Newton aſſigns its uſe thus: if indeterminate quantities of divers kinds be compared together, and one of them be ſaid to be *ut*, *as*, any other directly or inverſely; the meaning is, that the firſt is increaſed or diminiſhed, in the ſame ratio as the latter.— And if one of them be ſaid to be, *ut*, *as*, two or more others directly, or inverſely, the meaning is, that the firſt is increaſed or diminiſhed, in a ratio, compounded of the ratios in which the others are increaſed or diminiſhed.

Thus, if A be ſaid to be *as* B directly, and *as* C directly, and as D inverſely, the meaning is, it is increaſed or diminiſhed, in the ſame ratio with $B \times C \times \dot{D}$, that is, A and $\frac{BC}{D}$ are to each other in a given ratio. *Phil. Nat. Princ. Math.*

UT, in muſic, the firſt of the muſical notes. See NOTE.

Ut, *re*, *mi*, *fa*; the clef of *G*, *re*, *ſol*, *ut*; of *C*, *ſol*, *ut*, &c. See SCALE, &c.

This note, with the reſt, were taken out of the hymn of S John Baptiſt. *Ut queant laxis*, &c. See MUSIC.

UTFANGTHEF*, an antient royalty, or privilege, granted to the lord of a manor by the king, giving him a power to puniſh a thief dwelling, and committing theft out of his liberty; if he be taken within the lord's fee.

* Utfangthef *dicitur extraneus latro veniens aliunde de terra aliena, & qui captus fuit in terra ipſius qui tales habet libertates.* Bracton.

UTENSIL, UTENSILE, a little domeſtic moveable, belonging principally to the kitchen.— Such are pots, pans, plates, &c.

UTENSILS, are more particularly uſed in war, for the moveables which the hoſt is obliged to furniſh the ſoldiers quartered with him; which are, a bed with bed-cloths, a pot and a ſpoon. — They are likewiſe to have a place at their hoſt's fire, and candle.— *Utenſils* are ſometimes furniſhed in money, and ſometimes in kind.

UTERINE, UTERINUS, ſomething belonging to the uterus, or womb of women. See UTERUS, and MATRIX.

Uterine brothers or ſiſters, as thoſe born of the ſame mother, but different fathers. See BROTHER, &c.

Furor UTERINUS, in medicine, denotes a kind of madneſs, attended with laſcivous ſpeeches and geſtures, and an invincible inclination to venery. See FUROR.

The *furor uterinus*, is a complication of hyſterical ſymptoms ariſing from a turgeſcency, or inflation of the *uterine* veſſels. See HYSTERIC.

Men are ſubject to the like diſeaſe, as well as women; ſo that it might with more propriety be called, the *furor venereus*, or *venereal fury.*— It had its name *furor uterinus*, from an opinion, that it proceeded from vapours, riſing from the womb to the brain.

It has been frequently found, that maids held to be poſſeſſed, were only ſeized with the *uterine fury.* See POSSESSION.

The *furor uterinus*, is uſually ſuppoſed to conſiſt in ſome irregular motion of the ſpirits, occaſioned by a hot, luſtful temperament, the converſation of debauched perſons, or the reading of wanton books, hot foods, the abundance and acrimony of the ſerous matter which moiſtens the pudendum, ſuppreſſion of the menſes, large doſes of cantharides, &c.

Before the paroxyſm, the patient often appears ſilent and ſorrowful, with a fluſhing in the face, and a reſpiration and pulſe frequently intermitting, and ſuddenly varying.— During the paroxyſm they burſt ſometimes into laughter, and then into a fit of tears, &c.

Bleeding, fætid ſuffiments, and other hyſterical medicines, are proper during the fit.

UTERINUM *Jecur.* See the article JECUR.

UTERUS, in anatomy, *matrix*, or *womb*; that organ of generation in women, wherein the buſineſs of conception is performed, and wherein the embryo or fœtus is lodged, fed, and grows, during the time of geſtation, or till its delivery.

Its deſcription ſee under the article MATRIX.— Its office, &c. under GENERATION, CONCEPTION, GESTATION, FOETUS, &c.

Fundus UTERI.	See the article	FUNDUS.
Procidentia UTERI.		PROCIDENTIA.

Vagina, or *Cervix* UTERI. See VAGINA, and CERVIX.

UTILE, a Latin term, ſignifying profitable or uſeful; ſometimes uſed by Engliſh authors in the ſame ſenſe.

The *utile* and the *dulce*, profit and delight, are both to be aimed at in poetry; but it is diſputed which of them is to be aimed at in the firſt place.— Corneille ſays expreſly, *Dans la tragedie l'utile n'entre que ſous la forme du delectable.* See POETRY.

In the language of the philoſophers, there is nothing *utile*, but what is juſt and honeſt: *nihil bonum niſi honeſtum: nihil malum niſi turpe.* Cic. de Fin. lib. 2.

UTILE *Dominium.* See the article DOMINIUM.

UTLAGARIÆ *Perdonatio.* See PERDONATIO.

UTLAGATIO, in law-term, an outlawry. See OUTLAWRY.

UTLAGATO *Capiendo, quando utlagatur in uno comitatu & poſtea fugit in alium*, a writ for the apprehending a man who is outlawed in one country, and flies into another. See OUTLAWRY.

UTLAGATUM *Capias.* See the article CAPIAS.

UTLAGH, UTHLAGHUS. See the article OUTLAW.

UTLAND, *Outland.* See the article INLAND.

UTLARY, or UTLAWRY, UTLAGARIA. See OUTLAWRY.

UTRUM. See the article ASSISE, &c.

UTTER *Barriſter.* See the article BARRISTER.

UVEA. See TUNICA.

UVEA (in anatomy) *aciniformis tunica*, the third tunic, or brane of the eye, thus called, as reſembling the colour or figure of a grape. See EYE.

* It it called— *uvea*, on account of its reſembling the figure and colour of a grape, call'd, by the Latins, *uva.* For which reaſon alſo ſome have given it the name of— *Aciniformis*; from *acinus*, a grape-ſtone.

The hind part of this coat, or that the next, the orbit of the eye on each ſide, is called the *choroides*; and is derived from the *pia mater.*

The anterior, or fore part is, like the former, traſparent, but thinner; and is, by authors, reckoned as a different tunic, and called *uvea.*

Of the duplicature of this part, is formed that ſtriped, variegated circle, called the *iris.* See IRIS.

And in its middle is a perforation, through which appears a little black ſpeck, which is the ſight, or pupil of the eye; and about which the iris forms a ring. See PUPIL.

From the inſide of this membrane, ſpring certain fibres, which ſpread themſelves round the cryſtalline humour; ſerving to contract or dilate the ſight at pleaſure; and called the *ligamentum ciliare.* See LIGAMENTUM.

To the *teſticles* belongs the *vaginalis tunicæ.* See ELYTROIDES.

VULCANO, among naturaliſts. See VOLCANO.

VULGAR *Algebra.*		ALGEBRA.
VULGAR *Arithmetic.*		ARITHMETIC.
VULGAR *Fractions.*		FRACTIONS.
VULGAR *Purgation.*		PURGATION.
VULGAR *Stone.*		STONE.

VULGATE, a very antient Latin tranſlation of the Bible; and the only one the church of Rome acknowledges authentic. See BIBLE.

The antient *vulgate* of the Old Teſtament, was tranſlated almoſt word for word, from the Greek of the Seventy. The author of the verſion is not known, nor ſo much as gueſſed at. See SEPTUAGINT.

It was a long time known by the name of the *Italic*, or old verſion; as being of very great antiquity in the Latin church. — It was the common, or vulgar verſion, before S. Jerom made a new one; whence its name *vulgate*.

Nobillius, in 1588, and F. Morin, in 1628, gave new editions of it; pretending to have reſtored, and re-collated it, from the antients who had cited it.— The *vulgate* was held by S. Auguſtine, to be preferable to all the other Latin verſions then extant; as rendering the words and ſenſe of the ſacred text, more cloſely and juſtly than any of the reſt. It has ſince been retouched from the corrections of S. Jerom; and it is this mixture of the antient Italic verſion, and ſome corrections of S. Jerom, that is now called the *vulgate*, and which the council of Trent has declared to be authentic.

It is this *vulgate* alone is uſed in the Romiſh church, excepting for ſome paſſages of the antient *vulgate* left in the miſſal, and the pſalms; which are ſtill ſung, according to the old Italic verſion. See BIBLE.

VULGATE *of the New Teſtament*.— This the Romaniſts generally hold preferable to the common Greek text; in regard it is this alone, and not the Greek text, that the council of Trent has declared authentic: accordingly, that church has, as it were, adopted this edition. The prieſts read no other at the altar, the preachers quote no other in the pulpit, nor the divines in the ſchools.

Yet ſome of their beſt authors, F. Bouhours for inſtance, own, that among the differences that are found between the common Greek, and the *vulgate*, there are ſome wherein the Greek reading appears more clear and natural, than that of the Latin; ſo that the ſecond might be corrected from the firſt, if the holy ſee ſhould think fit.— But thoſe differences, for the generality, only conſiſt in a few ſyllables, or words; they rarely touch the ſenſe. Beſides, in ſome of the moſt conſiderable, the *vulgate* is authorized by ſeveral antient manuſcripts.

Bouhours ſpent the laſt years of his life, in giving a French tranſlation of the New Teſtament, according to the *vulgate*.

In 1675, a new edition of the Greek Teſtament was publiſhed by the univerſity of Oxford; and great care taken therein, to compare the common Greek text with all the moſt antient manuſcripts in England, France, Spain, and Italy; and to note the differences obſerved therein.

In the preface of this work, the editors ſpeaking of the divers verſions of the Bible in the vulgar tongues, obſerve of the *vulgate*, that there is no verſion in any language to be compared with it.— And this they juſtify, by comparing paſſages that occur in the moſt celebrated Greek manuſcripts, with the ſame paſſages in the *vulgate*, where there is any difference between that, and the common printed Greek copy.

In effect, it is probable, that at the time the antient Italic, or *vulgate* verſion of the New Teſtament was made, and at the time it was afterwards compared with the Greek manuſcripts, by S. Jerom; as they were then nearer the times of the Apoſtles, they had juſter Greek copies, and thoſe better kept, than any of thoſe uſed when printing was firſt ſet on foot, two centuries ago.

M. Simon calls the Greek verſion of the Seventy, before it was reviſed and reformed by Origen, *The antient* vulgate *Greek*.— Origen's correction got the upper hand of the antient Greek, and joſtled it out of uſe; ſo that we have now ſcarce any copies thereof. See SEPTUAGINT.

VULNERARY *, in medicine, an epithet given to remedies, proper for the cure of wounds, and ulcers. See WOUND, and TRAUMATIC.

* The word is formed from the Latin *vulnus*, wound.

There are divers *vulnerary* herbs; as ariſtolochia, or birthwort; ſanicle, or ſelf-heal; plantain, mouſe-ear, veronica, or fluellin, agrimony, vervein, or holy herb, &c.

There are alſo *vulnerary* potions, compoſed of various ſimples.— *Vulnerary* balms, unguents, plaiſters, &c. See BALSAM, &c.

VULNERARY *Water*. See the article WATER.

VULTUS *de Luca*, the ſame with *veronica*. See VERONICA.

VULVA*, a name which ſome phyſicians give to the uterus, or womb. See MATRIX.

* The word is Latin, *vulva*, *quaſi valvæ*, a door.

VULVA is ſometimes alſo, though leſs properly, uſed for the cunnus, or pudendum muliebre. See GENITAL, and GENERATION.

UVULA, in anatomy, a round, ſoft ſpongeous body, like the end of a child's finger; ſuſpended from the palate, near the foramina of the noſtrils, perpendicularly over the glottis. See GLOTTIS, LARYNX, VOICE, &c.

Its uſe is to break the force of the cold air, and prevent its entring too precipitately into the lungs. See RESPIRATION, LUNGS, &c.

It is formed of a duplicature of the membrane of the palate; and is called, by ſome authors, *columella*, and, by others, *gurguglio*. It is moved by two pair of muſcles, and ſuſpended by as many ligaments.— The muſcles are, the *external*, called the *ſphenoſtaphylinus*, which draws the *uvula* upwards, and backwards; and hinders the maſticated aliment from paſſing into the foramina of the noſtrils in deglutition. See SPHENOSTAPHYLINUS.

And the *internal*, called the *pterygoſtaphylinus*; which draws the *uvula* upwards and forwards. See PTERYGOSTAPHYLINUS.

Both muſcles move the *uvula* upwards, to give room for ſwallowing; and ſerve to raiſe it, when relaxed and fallen down.— In which caſe, it is uſual to promote its riſing, by applying a little beaten pepper on the end of a ſpoon to it. See DEGLUTITION.

Bartholin ſays, that ſuch as have no *uvula* are ſubject to the phthiſic, and uſually die thereof; by reaſon the cold air, entering the lungs too haſtily, corrupts them. See PHTHISIS.

UVULÆ *Procidentia*. See the article PROCIDENTIA.

UXORIUM, in antiquity, a fine, or forfeit paid by the Romans for not marrying. See MARRIAGE, POLITICAL *Arithmetic*, &c.

UZIFIR, UZUFAR, or UZIFUR, in chymiſtry, a name which ſome authors give to cinnabar. See CINNABAR.

W.

W, A letter particular to the northern languages, and people; as the Engliſh, Dutch, Poliſh, and others of Teutonic and Sclavonic original. See LETTER, and ALPHABET. The *w* is alſo ſometimes admitted into the French, Italian, &c. in proper names, and other terms borrowed from the languages where it is uſed.

In Engliſh, the *w* is uſually a conſonant; and as ſuch, may go before all the vowels, except *u*; as in *want*, *weapon*, *winter*, *world*, &c. See CONSONANT.

It is ſometimes alſo a vowel; and as ſuch, follows any of the vowels *a*, *e*, *o*, and unites with them into a kind of double vowel, or dipthong; as in *law*, *ewe*, *ſow*, &c.

The Engliſh *w* is ſounded as in Latin, *u*, in *quantum*, *ſuadeo*, *lingua*.— Its ſound is alſo commonly like the groſs, or full *u* rapidly pronounced.— In French, the ſound of the *w* does not differ from that of the ſingle *v*. See U.

WADD, or WADDING, in gunnery, a ſtopple of paper, hay, ſtraw, old clouts, or the like, forced into a gun upon the powder, to keep it cloſe in the chamber; or put up cloſe to the ſhot, to keep it from rolling out. See CHARGE, and TAMPION.

WAFE. See the article WAIF.

WAFT.— *To waft a ſhip*, is to convoy her ſafe, as men of war do by merchants ſhips. See CONVOY.

To make a WAFT, is to hang out ſome coat, ſea-gown, or the like, in the main ſhrouds of the ſhip, as a ſign for the men to come on board, &c.

Such *waft* is alſo frequently intended to ſhew that a ſhip is in diſtreſs, by a leak, &c. and therefore wants help from the ſhore, or from other ſhips.

WAFTERS, WAFTORES, conducters of veſſels at ſea. See CONVOY.

King Edward IV. conſtituted a triumvirate of officers with naval power, whom the patent ſtiles *cuſtodes*, *conductores*, and *waftores*; whoſe buſineſs chiefly was to guard our fiſhermen on the coaſts of Norfolk, and Suffolk.

WAGA, or VAGA. See the article WEIGH.

WAGAR, WAGING, in law, *vadari*, ſignifies the giving ſecurity for the performance of any thing. See GAGE, PLEDGE, VADARI, &c.

Thus, to *wage* law, is to put in ſecurity that you will make law at the day aſſigned. See MAKE.

WAGGON, a kind of vehicle, or carriage in common uſe. See CARRIAGE, &c.

There are divers forms of *waggons*, accommodated to the divers uſes they are intended for.— The common *waggon* conſiſts of the *ſhafts*, or *rads*, which are the two pieces the hind horſe bears up; the *welds*; the *ſlotes*, which are the croſs pieces that hold the ſhafts together; the *bolſter*, being that part on which the fore wheels and axletree turn, in wheeling the *waggon* acroſs the road; the *cheſt*, or body of the *waggon*, having the ſtaves or rails fixed thereon; the *bales*, or hoops, which compoſe the top; the *tilt*, the place covered with cloth at the end of the *waggon*: beſides the *wheels*, *axletree*, &c.

The larger the wheels of the *waggon*, and their circumference, the eaſier the motion; and the leſs, the heavier, and more uneaſy and jogging they go.— But ſtill, the higher a *waggon*, &c. is ſet, the apter it is to overturn.— The only reaſon why the fore wheels of *waggons*, &c. are made leſs than the hind wheels, is for the conveniency of turning. See WHEEL.

The more upright or ſquare the ſpokes of the wheels are from the box, or centre, the weaker they are when they come to bear on either ſide: on which account, as alſo to ſecure a wheel from breaking in a fall, they are made concave, or diſhing.

WAGGONER, in aſtronomy, a kind of conſtellation, called alſo *Charles's wain*. See CHARLES'S WAIN.

WAGGONER is alſo uſed for a routier, or book of charts, deſcribing the ſeas, their coaſts, &c. See CHART, and ATLAS.

WAIF, or WAFE, a term primarily applied to ſtolen goods, which a thief, being purſued, or over-burthened, flies, and leaves behind him, or drops in the way.

The king's officer, or the bailiff of the lord within whoſe juriſdiction ſuch *waifs* or *waif* goods were left (having by grant, or preſcription, the franchiſe of *waif*) may ſeize the goods to his lord's uſe; except the owner come with freſh ſuit after the felon, and ſue an appeal of robbery within a year and a day, or give in evidence againſt him, and he be attainted.— In which caſes, the owner ſhall have his goods again.

Waifs, things loſt, and eſtrays, are ſaid to be *pecus vagrans*; and are *nullius in bonis ubi non apparet dominus*. And therefore belong to the lord of the franchiſe where they are found; who muſt cauſe them to be cried, and publiſhed in the markets, and churches near about: elſe the year and day does not run to the prejudice of him that loſt them.

Though *waif* be properly ſpoken of things ſtolen, yet it may alſo be underſtood of goods not ſtolen.— As, if a man be purſued with hue and cry, as a felon, and he flies, and leaves his own goods; theſe ſhall be forfeit as goods ſtolen: and are properly called *fugitive goods*. See FUGITIVE.

WAIN. See the article CHARLES'S *Wain*.

WAINSCOT, in building, the timber-work ſerving to line the walls of a room; being uſually in pannels, and painted, to ſerve in lieu of hangings. See WALL, &c.

Even in halls, it is common to have *wainſcot* breaſt high; by reaſon of the natural humidity of walls. See WALL.

Some joiners put charcoal behind the pannels of the *wainſcot*, to prevent the ſweat of ſtone and brick-walls from ungluing the joints of the pannels.— Others uſe wool for the ſame purpoſe.— But neither the one nor the other is ſufficient in ſome houſes: the only ſure way, is, by priming over the back-ſides of the joints with white lead, Spaniſh brown, and linſeed oil.

According to Neve, *wainſcotting* with Norway oak, the workman finding ſtuff, is valued at ſix or ſeven ſhillings *per* yard ſquare.— Plain ſquare *wainſcotting*, the workman finding deal, is valued at three ſhillings, or three ſhillings ſixpence *per* yard.— Large biſſection *wainſcotting*, with Dantzick ſtuff, is valued at ſix or ſeven ſhillings *per* yard; and ordinary biſſection work, at three ſhillings ſix-pence *per* yard.

In taking dimenſions, they uſe a ſtring, which they preſs into all the mouldings; it being a rule that they are to be paid for all where the plane goes. See MEASURING.

WAVE, in law, a woman that is put out of the protection of the law. See OUTLAW.

She is called *waive*, as being forſaken of the law: and not *outlaw*, as a man is; by reaſon women cannot be of the decenna, are not ſworn in leets to the king, nor to the law, as men are; who therefore are within the law: whereas women are not; and ſo cannot be outlawed, ſince they never were within it. See DECENNIER, FRIBURGH, &c.

In this ſenſe we meet with *waviaria mulieris*, as of the ſame import with *utlagatio viri*. See OUTLAWRY.

WAKE *of a ſhip*, is the ſmooth water a-ſtern, when ſhe is under ſail.

By this, a gueſs may be made of the ſpeed ſhe makes. See RECKONING.

They alſo judge from this, whether the ſhip goes as ſhe looks; that is, whether ſhe makes her way right a-head, as ſhe lies; as ſhe doth when her *wake* is right a-ſtern: but if this *wake* be a point or two to leeward, they judge that ſhe falls to the leeward of her courſe.

When, in a ſhip's ſtaying ſhe is ſo quick, that ſhe does not fall to leeward upon a tack, but that when tacked, her *wake* is to the leeward, they ſay, *She ſtays to the weather of her wake*; which is a ſign ſhe feels her helm well, and is nimble of ſteerage.

Alſo, when one ſhip, giving chaſe to another, is got as far into the wind as ſhe, and ſails directly after her, they ſay, *She is got into her wake*.

WAKEFULNESS, or WATCHING, *inſomnia*. See WATCHING.

WAKES*, VIGILS, or *Country*-WAKES, are certain antient anniverſary feaſts, in ſeveral pariſhes; wherein the people were to be awake at the ſeveral vigils, or hours to go to prayer. See VIGIL.

They are uſually obſerved, in the country, on the Sunday next after the ſaint's day to whom the pariſh-church is dedicated.

Cowel defines them by *vigils*, in the dedications of churches, where men ſat drinking in the choir all night. See DEDICATION.

WALDENSES. See the article VAUDOIS.

WALKERS, a ſort of foreſt-officers, appointed by the king to *walk* about a certain ſpace of ground, committed to their care, and inſpection. See FOREST.

Walkers, are the ſame with what we otherwiſe call *foreſters*. See FORESTER.

WALKS, in gardening. See the article ALLEYS.

To keep the weeds from growing upon *walks*, Mr. Switzer directs, that the bottoms thereof be filled with lime-rubbiſh, or coarſe gravel, flint ſtones, or other rocky ſtuff, eight or ten inches deep; over which may be laid a like depth of gravel, not too fine.

To keep them the drier, they are to be made rounding, or convex.— The uſual proportion is, that a *walk* 20 feet wide, be four inches higher in the middle, than at the ſides; a *walk* 25 feet wide, 5 inches, &c.

---

* The word is formed from the Saxon, *Wæcce*, *vigilia*, *excubiæ*, watch.

After laying a *walk*, it is to be rolled, both lengthwiſe and croſs-wiſe; and to lay it the firmer, it muſt have three or four water-rollings; that is, when it rains ſo very faſt, that the *walk* ſwims with water: which, when dry weather comes, will bind as hard as terrace.

To make the gravel bind the better, ſome mix a little lime with it; which being apt to ſtick to the heels of the ſhoes in wet weather, others grind or pound ſea-ſhells, and lay a thin coat thereof on the gravel; which being rolled, incorporates with the gravel, and hinders its hanging to the ſhoes.— Others beat ſmiths cinders to duſt, and others bricks; ſtrewing the duſt on the *walks*, which dries up the moiſture, and gives them a colour.

Gravel-WALK.	See	GRAVEL.
Ring-WALK, among hunters.		RING-*Walk*.
Terrace-WALK.		TERRACE.

WALKING-*Fire*. See the article *Ignis* FATUUS.

WALL, in architecture, &c. a work of ſtone, brick, wood, or the like; making the principal part of a building; as ſerving both to incloſe it, and to ſupport the roof, floors, &c. See BUILDING, HOUSE, &c.

Walls, though built very thick and ſtrong, and their foundations laid deep, yet, if carried on ſtreight in a line, are inclined to lean, or fall; and ſuch as are built crooked, though thin and weak, are much more laſting.— A *wall* raiſed over a river, on arches of pillars, ſtands as firm as others, whoſe foundation is entire.

Hence it appears, that a *wall* built much thinner than uſual, by only having at every 20 feet's diſtance an angle ſet out about two feet, or more, in proportion to the heighth of the *wall*; or by having at the like diſtance, a column, or pilaſter erected along with it, ſix or eight inches on each ſide, over and above the thickneſs of the reſt of the *wall*: ſuch *wall* will be much ſtronger, than if five times the quantity of materials were uſed in a ſtreight *wall*.

Walls are diſtinguiſhed into divers kinds, from the matter whereof they conſiſt; as *plaiſtered*, or *mud-walls*, *brick-walls*, *ſtone-walls*, *flint* or *boulder-walls*, and *boarder-walls*.— In all which theſe general rules are to be regarded.

1°. That they be built exactly perpendicular to the groundwork.

2°. That the maſſieſt and heavieſt materials be the loweſt; as fitter to bear, than be born.

3°. That the *walls*, as they riſe, diminiſh proportionally in thickneſs, for eaſe both of weight and expence.

4°. That certain courſes, or ledges, of more ſtrength than the reſt, be interlaid, like bones, to ſtrengthen the whole fabric.

Mud and *Plaiſtered*-WALLS, are chiefly in ordinary timber-buildings.— Theſe *walls*, being quartered and lathed between the timber, or ſometimes lathed over all, are plaiſtered with loam, (ſee LOAM;) which being almoſt dry, is plaiſtered over again with white mortar. See MORTAR.

Brick-WALLS, are the moſt important and uſual among us.— In theſe, particular care is to be taken about the laying of the bricks, *viz.* That in ſummer they be laid as wet, and in winter as dry as poſſible, to make them bind the better with the mortar: that in ſummer, as faſt as they are laid, they be covered up, to prevent the mortar, &c. from drying too faſt: that in winter they be covered well, to protect them from rain, ſnow, and froſt, which are all enemies to the mortar: that they be laid joint on joint in the middle of *walls*, as ſeldom as may be; but, good bond made there, as well as on the outſides.— Care is likewiſe to be taken, that the angles be firmly bound: in order to which, in working up the *walls* of a building, it is not adviſable to raiſe any *wall* above three feet high, ere the next adjoining *wall* be wrought up to it; that good bond may be made in the progreſs of the work.

Laſtly, in building a houſe in the city of London, the *walls* are to be of ſuch thickneſſes, as are enjoined by the act of parliament for rebuilding that city. See HOUSE.

Flint, or Boulder-WALLS, are frequently uſed in divers parts for fence-*walls*, a-round courts, gardens, &c. and even for *walls* of out-houſes.— Sir Henry Wotton obſerves, that the building of *walls* of flint, is a thing utterly unknown to the antients; who obſerving in that material a kind of metallic nature, at leaſt a fuſibility, reſerved it for nobler uſes. See BOULDER.

Theſe *walls* are uſually raiſed by a right and left-handed man, who have a hod of mortar poured down on the work, which they part betwixt them; each ſpreading it towards himſelf, and ſo they lay in the flints.— The mortar for this work is to be very ſtiff.

Angle of a WALL.	See the article	ANGLE.
Coping of a WALL.		COPING.
Plinth of a WALL.		PLINTH.
Scenography of WALLS.		SCENOGRAPHY.
Painting on WALLS.		PAINTING.

Party-WALLS.	See the article	PARTITION.
Picts-WALL.		PICTS.
Fence-WALLS.		FENCE.

WALL in fortification, &c. See the article RAMPART.

WALLS, in gardening, &c.— The poſition, matter, and form of *walls*, for fruit-trees, are found to have a great influence on the fruit: though authors differ as to the preference. See GARDEN, ORCHARD, &c.

The reverend Mr. Lawrence directs, that the *walls* of a garden be not built directly to face the four cardinal points, but rather between them, *viz.* ſouth-eaſt, ſouth-weſt, north-eaſt, and north-weſt: in which the two former will be good enough for the beſt fruit, and the two latter for plums, cherries, and baking pears. See EXPOSURE.

Mr. Langford, and ſome others, propoſe garden-*walls* to conſiſt chiefly of ſemicircles; each about ſix or eight yards in front, and including two trees; and between every two ſemicircles, a ſpace of two feet of plain *wall*.— By ſuch a proviſion every part of a *wall* will enjoy an equal ſhare of the ſun, one time with another; beſide, that the warmth will be increaſed, by the collecting and reflecting of the rays in the ſemicircles; and the trees within be ſcreened from injurious winds.

As to the materials of *walls* for fruit-trees, brick, according to Mr. Switzer, is the beſt; as being the warmeſt and kindeſt for the ripening of fruit, and affording the beſt conveniency for nailing.

Mr. Lawrence, however, affirms, on his own experience, that *mud-walls*, made of earth and ſtraw tempered together, are better for the ripening of fruit, than either brick or ſtone *walls*: he adds, that the coping of ſtraw laid on ſuch *walls*, is of great advantage to the fruit, in ſheltering them from perpendicular rains, &c.

M. Fatio, in a particular treatiſe on the ſubject, inſtead of the common perpendicular *walls*, propoſes to have the *walls* built ſloping, or reclining from the ſun; that what is planted againſt them, may lie more expoſed to his perpendicular rays; which muſt contribute greatly to the ripening of fruit in our cold climate.

The angle of reclination, is to be that of the latitude of the place; that, when the ſun is in the meridian at the equinoxes, his rays may ſtrike juſt perpendicularly. See HEAT.

Yet ſome others prefer perpendicular *walls*, and even inclining ones, or ſuch as hang forwards to the ſun; as ſuch receive the ſun's rays perpendicularly when he is low; as in ſpring and autumn, or in the evening and morning: which they imagine of more ſervice, than the greateſt heats of the ſun at midſummer, upon reclining *walls*.

Add, that in autumn the ſun is moſt wanted to ripen winter pears; in order to which, they ſhould be kept dry, which againſt ſloping *walls* cannot be; the dews, &c. lying much longer thereon, than on thoſe that are perpendicular.

One great advantage, however, of M. Fatio's ſloping *walls*, is, that fruit-trees, as vines, &c. being planted againſt them, melon-glaſſes may be ſet on the fruit; which will much forward its ripening.

Sea-WALLS.	See the article	DIKE.
WALL-*Trees*.		TREE.
Planting WALL *fruit-trees*.		PLANTING.

WALOON, or WALLOON, a kind of old French; being the language ſpoke by the Walloons, or the inhabitants of a conſiderable part of the French and Auſtrian Low-Countries, *viz.* thoſe of Artois, Hainault, Namur, Luxemburg, and part of Flanders and Brabant.

The *Waloon* is held to be the language of the antient Gauls, or Celts. See LANGUAGE, &c.

The Romans having ſubdued ſeveral provinces in Gaul, eſtabliſhed prætors, or proconſuls, &c. to adminiſter juſtice in the Latin tongue. On this occaſion, the natives were brought to apply themſelves to learn the language of the conquerors: and thus introduced abundance of the Roman words and phraſes into their own tongue.

Of this mixture of Gauliſh and Latin, was formed a new language, called *Romans*; in contradiction to the antient unadulterated Gauliſh, which was called *Walon*, or *Walloon*.

This diſtinction is kept up to this day; for the inhabitants of ſeveral of the low-country provinces ſay, that in France they ſpeak Romans; whereas they ſpeak the *Walloon*, which comes much nearer the ſimplicity of the antient Gauliſh. See ROMANS, and FRENCH.

WANDASS. See the article WINDASS.

WANDERING *Stars*. See the article STAR.

WANLASS, in hunting.— Driving the *wanlaſs*, is the driving of deer to a ſtand, that the lord may have a ſhoot: which is one of the cuſtomary ſervices of fiefs. See HUNTING.

WAPENTAKE, or WEAPENTAKE, a diviſion of certain northern counties, particularly thoſe beyond the Trent, anſwering to what in other places is called a *hundred*, or a *cantred*. See HUNDRED.

Authors differ as to the origin of the word.— Brompton brings it from the Saxon *waepen*, and *taecan*, to deliver, by reaſon the tenants antiently delivered their arms to every new lord, as a token of their homage.

Sir Thomas Smith gives a different account.— Muſters, he obſerves, were antiently taken of the armour and weapons of the ſeveral inhabitants of every hundred; and from ſuch as could not find ſufficient pledges for their good abearing, their *weapons* were *taken* away, and delivered to others.

Others give a different account of its riſe, *viz.* That when firſt the kingdom was divided into *wapentakes*, he who was the chief of the diviſion, and whom we now call *high-conſtable*, as ſoon as he entered upon his office, appeared in the field, on a certain day, on horſe-back, with a pike in his hand; and all the chief men of the hundred met him with their lances; who alighting, touched his pike with their lances, as a ſignal they were firmly united to each other, by the touching their weapons.— Whence the denomination *wapentake* from the Saxon *waepen*, and *tac*, touching.

WAR, *Bellum*, a conteſt, or difference between princes, ſtates, or large bodies of people; which not being determinable by the ordinary meaſures of juſtice and equity, is referred to the deciſion of the ſword.

Hobbes's great principle is, that the natural ſtate of man, is a ſtate of *warfare*; moſt other politicians hold *war* to be a preternatural, and extraordinary ſtate.

Civil, or *Inteſtine* WAR, is that between ſubjects of the ſame realm; or between parties in the ſame ſtate. See CIVIL.

In this ſenſe, we ſay, the *civil wars* of the Romans deſtroyed the republic: the *civil wars* of Granada ruined the power of the Moors in Spain: the *civil wars* in England begun in 1641, ended in the king's death, 1648.

King's WAR, *Bellum regis*.— At the time when particular lords were allowed to make *war* with one another, to revenge injuries, inſtead of proſecuting them in the ordinary courts of juſtice; the appellation *king's war* was given to ſuch as the king declared againſt any other prince, or ſtate: on which occaſion, the lords were not allowed to make private *war* againſt each other; as being obliged to ſerve the king, with all their vaſſals. See VASSAL, &c.

Religious WAR, is a *war* maintained in a ſtate, on account of religion; one of the parties refuſing to tolerate the other.

Holy WAR, is that antiently maintained by leagues and croiſades, for the recovery of the holy land. See CROISADE.

Art of WAR. See the article MILITARY *Art*.

Council of WAR, is an aſſembly of great officers, called by a general or commander, to deliberate with him on enterprizes, and attempts to be made. See COUNCIL.

On ſome occaſions, *council of war* is alſo underſtood of an aſſembly of officers, ſitting in judgment on delinquent ſoldiers, deſerters, coward-officers, &c.

Habiliments of WAR.	See the article	HABILIMENT.
Man of WAR.		SHIP, RATE, &c.
Officers of WAR.		OFFICERS.

Place of WAR, is a place fortified, on purpoſe to cover and defend a country, and ſtop the incurſion of an enemy's army: or, it is a place wherein are diſpoſed the proviſions of *war*, for an army incamped in the neighbourhood; or whither an army retires into winter quarters. See PLACE.

WARBLING *of the wings*, in falconry, is when a hawk, after having mantled herſelf, croſſes her wings over her back. See HAWK, and FALCON.

WARD, WARDA, *cuſtody* or *keeping*. See GUARD.

WARD, is a word uſed in our law-books, in divers ſignifications.— Thus, a *ward*, in London is a part of the city, committed to the ſpecial charge of one of the aldermen of the city. There are 26 wards in London, which are as hundreds, and the pariſhes thereof as towns. See ALDERMAN, HUNDRED, &c.

A foreſt is alſo divided into *wards*; ſo are moſt of our hoſpitals. See FOREST, WOODWARD, and HOSPITAL.— A priſon is ſometimes alſo called a *ward*. See GOAL.

The heir of the king's tenant, who held by knights-ſervice, or in capite, was alſo called a *ward*, during his non-age.— But this ſort of wardſhip is taken away by the ſtatute, 12 Car. II. cap. 24. See WARDS.

Caſtle WARD. See the article CASTLE.

WARD, WARDA, or WARDAGIUM, is alſo uſed in our antient writers, for the cuſtody of a town or caſtle, which the tenants and inhabitants were bound to keep at their own charge. See WARDAGE.

WARDA *Eccleſiarum*, denotes the guardianſhip of churches: which is in the king during vacancies, by reaſon of the regalia, or temporalities. See REGALIA, and TEMPORALITIES.

WARDAGE, WARDAGIUM, is ſometimes uſed in our antient law-writers, in the ſame ſenſe with *wardpenny*. See WARDPENNY.

Sometimes it alſo ſeems to denote a being free from wardſhip.

WARDECORNE, among our antient writers, a duty incumbent on the tenants, to guard the caſtle, by ſounding a horn upon the approach of an enemy; called alſo *cornage*. See CORNAGE.

WARDEN, *Guardian*, one who has the charge, or keeping of any perſon, or thing, by office. See GUARD, and GUARDIAN.

Such is the *warden of the fleet*, the keeper of the fleet priſon; who has the charge of the priſoners there; eſpecially ſuch as are committed from the court of chancery for contempt. See FLEET.

Such alſo are, the *warden* of the fellowſhips, *warden* of the marſhes, *wardens* of peace, *warden* of the weſt marches, *warden* of the foreſt, *warden* of the alnage, *warden* of the king's wardrobe, &c. See GUARDIAN; ſee alſo JUSTICE, WARDROBE, &c.

WARDEN, in an univerſity, is the head of a college; anſwering to what in other colleges we call the *maſter* thereof. See UNIVERSITY, &c.

WARDEN, or *Lord* WARDEN *of the cinque-ports*, is the governour of thoſe noted havens; who has the authority of an admiral, and ſends out writs in his own name. See CINQUE-*Ports*.

WARDEN *of the mint*, is an officer, whoſe buſineſs is to receive the gold and ſilver bullion brought in by the merchants; to pay them for it, and overſee the other officers.— He is alſo called *keeper of the exchange*, and *mint*. See MINT.

Church-WARDENS.	See the article	CHURCH.
Renter-WARDEN.		RENTER.

WARDER.— *Yeomen warders of the Tower*, are officers, forty in number, who are accounted the king's domeſtic ſervants, and are ſworn by the lord chamberlain: their duty is, to attend the priſoners of ſtate, and wait at the gates. See TOWER.

Ten of them are uſually upon the day's wait, to take an account of all perſons who come into the tower; to enter their names, and the names of the perſons they go to, in a book to be peruſed by the conſtable or lieutenant.

WARDFEOH, or WARDFEGH, the value of a ward, or heir under age; or the money paid to the lord of the fee, for his redemption.

WARD-HOOK, in gunnery, a rod, or ſtaff, with an iron end, turned ſerpent-wiſe, or like a ſcrew, to draw the wads or ockam out of a gun, when it is to be unloaded.

WARDMOTE, in London, is a court ſo called, which is kept in every ward of the city; anſwering to the *curiata comitia*, in ancient Rome. See MOTE.

WARD-PENNY, WARDPENI, was formerly a cuſtomary due, paid to the ſheriff, or other officer, for maintaining watch and ward. See PENNY.

It was payable at the feaſt of S. Martin; and is ſtill paid within the manor of Sutton Colfield in Warwickſhire; and with ſome very ſingular ceremonies.

WARDROBE, a cloſet, or little room adjoining to a bed-chamber; ſerving to diſpoſe and keep a perſon's apparel in; or for a ſervant to lodge in, to be at hand to wait, &c.

WARDROBE, in a prince's court, is an apartment wherein his robes, wearing apparel, and other neceſſaries are preſerved; under the care and direction of proper officers.

His majeſty has a *great wardrobe*, a *removing wardrobe*, and divers *ſtanding wardrobes*, belonging to his bed-chamber, in each of his palaces, *viz.* at Whitehall, Kenſington, Windſor, Hampton-Court, and the Tower; each under its reſpective keeper.

The *removing wardrobe* always attends on the king's perſon; as alſo on embaſſadors, at chriſtenings, maſques, plays, &c. — It is under the command of the lord chamberlain: the under-officers are, a yeoman, two grooms, and three pages.

The *great wardrobe* is of great antiquity.— Antiently it was kept near puddle-wharf, in a houſe purchaſed for that purpoſe, by king Edward III. but ſince the fire of London, it has been kept in York-buildings.

The maſter or keeper thereof, is an officer of great dignity: high privileges were conferred on him by Hen. VI. King James I. enlarged the ſame, and erected the office into a corporation. See MASTER.

The officers are, the *maſter* or keeper, his *deputy*, and his *clerk*; beſides ſeveral under-officers; and above ſixty tradeſmen, all ſworn ſervants to the king. See CLERK.

This office is to provide for coronations, marriages, and funerals of the royal family; to furniſh the court with beds, hangings, carpets, &c. to furniſh houſes for embaſſadors, at their firſt arrival here; preſents for foreign princes and embaſſadors; furniture for the lord lieutenant of Ireland, and our embaſſadors abroad; robes for the knights and officers of the garter, heralds, purſuivants, miniſters of ſtate, liveries for the officers of the bed-chamber, and other ſervants; liveries for the lord chief juſtice, and barons of the Exchequer; and other officers in thoſe courts: as alſo yeomen, warders, trumpets, kettle-drums, meſſengers, coachmen, grooms, &c. with coaches, harneſſes, ſaddles, &c. The watermen, game-keepers; linen and lace for the king's perſon; tilts, &c. for his barges, &c.

WARDS, a court firſt erected by king Henry VIII. and after augmented by him with the office of liveries: but now abſolutely taken away and aboliſhed, by a ſtatute made 12 Car. II. cap. 24.

WARD-STAFF, the conſtable or watchman's ſtaff.

The manor of Lambourn in Eſſex, is held by ſervice of the *ward-ſtaff*, *viz.* the carrying a load of ſtraw in a cart with ſix horſes, two ropes, two men in harneſs, to watch the ſaid *ward-ſtaff*, when it is brought to the town of Aibridge, *&c.* Camd. *tit. Eſſex.*

WARD-WITE*, is defined by Fleta, as ſignifying a being exempted from the duty of watching.— Others rather take it for a duty paid towards the charge thereof.

* The word is compounded of the Saxon *ward*, *vigilia*, watch; and *wite*, mulct.

WARECTUM, in antient writings, ſignifies land that has lain long neglected, and untilled.

In antient records, we meet with *tempus warecti*, for the time wherein land lies fallow, or elſe the ſeaſon of fallowing. See FALLOW.

WAREN. See the article WARREN.

WARMTH. See the article HEAT.

WARN, in law, to ſummon a perſon to appear in a court of juſtice. See SUMMONS.

WARNING-*Wheel*, in a clock, is the third or fourth, according to its diſtance from the firſt wheel. See CLOCK.

WARP, in the manufactures, is the threads, whether of ſilk, wool, linen, hemp, cotton, or the like, that are extended lengthwiſe on the weaver's loom; and acroſs which the workman, by means of his ſhuttle, paſſes the threads of the woof, to form a cloth, ribband, fuſtian, or other matter. See WEAVING.

For a woollen ſtuff, *&c.* to have the neceſſary qualities, it is required that the threads of the *warp* be of the ſame kind of wool, and of the ſame fineneſs throughout; that they be ſized with Flanders or parchment ſize, well prepared; and that they be in ſufficient number, with regard to the breadth of the ſtuff to be wrought. See WOOF, CLOTH, *&c.*

To* WARP *a ſhip, is to hale her to a place, when the wind is wanting, by means of a hawſer, a cable, and an anchor fixed thereto.

WARPENI. See the article WARDPENNY.

WARRANT, an act, inſtrument, or obligation, whereby a perſon authorizes another to do ſomething, which he had not otherwiſe a right to do. See WARRANTY, GUARANTY, and VOUCHER.

WARRANT *of Attorney*, is that whereby a man appoints another to do ſomething in his name, and *warrants* his action. See ATTORNEY.

It ſeems to differ from a *letter of attorney*, which paſſes under hand and ſeal of him that makes it, before creditable witneſſes; whereas *warrant of attorney*, in perſonal, mixed, and ſome real actions, is put in of courſe by the attornies for the plaintiffs, or defendants.

Though a *warrant of attorney*, to ſuffer a common recovery by the tenant, or vouchee, is to be acknowledged before ſuch perſons as the commiſſion for the doing thereof directs. See RECOVERY, *&c.*

In the court of common pleas, there is a *clerk of the warrants*, who enters all *warrants of attorney* for plaintiff, and defendant. See CLERK.

WARRANTIZANDUM. See the article SUMMONS *ad Warrantizandum.*

WARRANTO. See the article QUO *Warranto.*

WARRANTY, WARRANTIA, a promiſe, or covenant by deed, made by the bargainer for himſelf and his heirs, to *warrant* and ſecure the bargainee and his heirs, againſt all men, for enjoying the thing agreed on between them. See VOUCHER.

Such *warranty* paſſes from the ſeller to the buyer; from the feoffer to the feoffee; from him that releaſes, to him that is releaſed from an action real.— The form of it is thus: *Et ego vero præfatus A. & hæredes mei prædictas quinque acras terræ cum pertinentiis ſuis præfato B. hæredibus & aſſignatis ſuis contra omnes gentes* warrantizabimus *in perpetuum, per præſentes.*

Note, under *hæredes*, heirs, are comprized all ſuch as the firſt *warranter*'s lands come to, whether by deſcent, purchaſe, or the like.

Warranty is either *real*, or *perſonal*.— *Real*, when it is annexed to lands and tenements granted for life, *&c.* which, again, is either *in deed*, or *in law*. See DE FACTO, &c.

Perſonal, either reſpects the property of the thing ſold, or the quality of it.

Real warranty, again, in reſpect of the eſtate, is either *lineal*, *collateral*, or *commencing by diſſeiſin*.

WARRANTIA *Chartæ*, a writ that lies for a perſon who is infeoffed in lands and tenements, with clauſe of *warranty*; and is impleaded in an aſſize, or writ of entry, wherein he cannot vouch, or call to *warranty*. See VOUCHER.

WARRANTIA *Diei*, a writ which lies in caſe where a man having a day aſſigned perſonally to appear in court to an action wherein he is ſued, is, in the mean time, by commandment employed in the king's ſervice; ſo that he cannot come at the day aſſigned.— It is directed to the juſtices, ordering them not to find or record him in default.

WARREN, WARENNA, a franchiſe, or place privileged, either by deſcription, or grant from the king, to keep beaſts and fowl of *warren* in; as rabbits, hares, partridges, pheaſants, *&c.* See BEAST, GAME, HUNTING, *&c.*

By a ſtatute 21 Edw. III. a *warren* may lie open, and there is no need of cloſing it in; as there is of a park. See PARK, *&c.*

If any perſon be found an offender in any ſuch *free warren*, he is puniſhable for the ſame at common law. See FREE.

***Beaſts of* WARREN.** See the article BEASTS.

WART, *Verruca*, a little round, hard excreſcence, ariſing on the fleſh, like a pea. See EXCRESCENCE.

Warts are more frequent on the hands than any other part.— There are divers ſorts; the moſt uſual are called *porraceæ*; as having heads like leeks, and conſiſting of little threads, reſembling the roots thereof.

Another ſort is called *myrmecia*, which is a little round, callous eminence on the hands of young children; riſing ſuddenly, and diſappearing again. See MYRMECIA.

A third ſort is the *acrochordon*. See ACROCHORDON.

Some phyſicians alſo rank the corns growing on the toes under the claſs of *warts*: which the Latins call *clavi*; becauſe occaſioning ſhooting pains, as if one were pricked with the point of a nail. See CLAVUS.

Warts, if only rooted in the cutis, are eaſily taken away; but if they ariſe from the tendons underneath, there is ſcarce any extirpating them without great danger.— The juice of chelidon. maſ. or eſula, or dens leonis, or tithymal, frequently applied, takes off *warts*.

Borelli commends water wherein ſal armoniac has been diſſolved: which Dr. Mapletoft, late profeſſor of phyſic at Greſham-college, makes no ſcruple to ſay is the only ſure remedy he knows of in all medicine.

WASHING. See the articles ABLUTION, LOTION, *&c.*

Waſhing the feet, was a common piece of civility among the Jews, practiſed upon ſtrangers, viſitors, *&c.* at their arrival.

Waſhing the feet of twelve poor people, is an anniverſary ceremony, performed both by the kings of England and France, in commemoration of our Saviour's *waſhing* the feet of his apoſtles.

Arnobius, *adv. Gentes*, Lib. VII. mentions a feaſt in uſe among the antients, called *lavatio matris deûm*, the *waſhing* of the mother of the gods, held on the 30th of March.

WASHING *one's hands*. See the article HAND.

WASHING *of a ſhip*, in the ſea language, is when all the guns are brought to one ſide; and the men, getting upon the yards, *waſh* her other ſide, and ſcrape her as far as they can reach.

WASHING, in painting, is when a deſign drawn with a pen, or crayon, has ſome one colour laid over it with a pencil; as indian ink, biſtre, or the like; to make it appear the more natural, by adding the ſhadows of prominences, apertures, *&c.* and by imitating the particular matters, whereof the thing is ſuppoſed to conſiſt.

Thus, they *waſh* with a pale red, to imitate brick and tyle; with a pale india blue, to imitate water and ſlate; with green, for trees and meadows; with ſaffron or French berries, for gold and braſs; and with ſeveral colours, for marbles.

Theſe *waſhes* are uſually given in equal teints, or degrees, throughout; which are afterwards brought down, and ſoftened over the lights with fair water, and ſtrengthened with deeper colours for the ſhadows. See LIGHT, and SHADOW.

WASHINGS, or WASHES, among goldſmiths, coiners, *&c.* are the lotions whereby they recover the particles of gold and ſilver out of the ſweep, *i. e.* aſhes, earths, ſweepings, *&c.*

This is either performed by ſimply *waſhing* them again and again, or by putting them in the *waſhing* mill.

To make one of theſe *waſhes*, they not only gather together the aſhes of the furnaces, and ſweepings of the workhouſes; but they alſo break and pound the old earthen crucibles, and the very bricks whereof the furnaces are built; little particles of gold, *&c.* being found to ſtick to them, by the crackling natural to thoſe metals, when in their laſt degree of heat.

Theſe matters being as well ground, and mixed together, are put in large wooden baſons, where they are *waſhed* ſeveral times, and in ſeveral waters, which run off, by inclination, into troughs underneath; carrying with them the earth, and the inſenſible particles of the metals, and only leaving behind them the larger and more conſiderable ones, which are viſible to the eye, and taken out with the hand without more trouble.

To get out the finer parts, gone off with the earth, they uſe quickſilver, and a *waſhing* mill.— This mill conſiſts of a large wooden trough, at bottom of which are two metalline parts, ſerving as mill-ſtones; the lower being convex, and the upper, which is in form of a croſs, concave.

A-top is a winch, placed horizontally, which turns the upper piece round; and at bottom a bung, to let out the water and earth, when ſufficiently ground.

To have a *waſh*, then, the trough is filled with common water; into which they caſt thirty or forty pounds of quickſilver, and two or three gallons of the matter remaining from the firſt lotion.— Then turning the winch, they give motion to the upper mill-ſtone; which grinding the matter and the quickſilver violently together, the particles of gold and ſilver become the more eaſily amalgamated therewith: This work they continue for two hours; when opening the bung, the water and earth runs out, and a freſh quantity is put in. See AMALGAMATION, *&c.*

The earths are uſually paſſed thus through the mill three times; and the ſame quantity of mercury uſually ſerves all the three times.— When there is nothing left in the mill but the mercury, united with the gold or ſilver which it has amalgamated, they take it out, and *waſhing* it in divers waters, they put it in a ticken bag, and lay it in a preſs, to ſqueeze out the water, and the looſe quickſilver: the remaining quickſilver they evaporate by fire, in a retort, or an alimbeck. The metal which remains, they refine with lead, or part it with aqua fortis. See GOLD, and SILVER; ſee alſo LAVATORY.

WASSAILE, or WASSEL, a feſtival ſong, ſung heretofore from door to door, about the time of Epiphany. See WASSEL-*Bowl.*

WASSEL-*Bowl*, or WASTEL-*Bowl*, was a large cup or bowl of ſilver or wood, wherein the Saxons, at their public entertainments, drank a health to one another, in the phraſe *was-heal*; that is, *health be to you.*

This *waſſel-bowl*, ſeems plainly to be meant by the word *vaſtellum*, in the lives of the abbots of S. Albans, by Matt. Paris; where he ſaith, *abbas ſolus prandebat ſupremus in refectorio habens* vaſtellum: "He had ſet by him the *waſſel-bowl*, to "drink an health to the fraternity; or the poculum chari-"tatis."

And hence the cuſtom of going a *waſſelling*, ſtill uſed in Suſſex, and ſome other places, ſeems to have taken its name.

WAST, or WASTE, *Vaſtum*, in law, has divers ſignifications. — 1°. It is uſed for a ſpoil, made either in houſes, woods, lands, *&c.* by the tenants for life, or for years, to the prejudice of the heir, or of him in reverſion, or remainder.— Upon this, the writ of *waſte* is brought for recovery of the thing *waſted*, and treble damages. See IMPEACHMENT.

WASTE *of the foreſt*, is, properly, where a man cuts down his own woods within the foreſt, without licenſe of the king, or lord-chief-juſtice in eyre. See FOREST, and PURLIEU.

WASTE, is alſo taken for thoſe lands which are not in any man's occupation; but lie common. See COMMON.

They ſeem to be ſo called, becauſe the lord cannot make ſuch profit of them as of his other lands; by reaſon of the uſe others have thereof, for paſſing to and fro.— Upon this none may build, cut down trees, dig, *&c.* without the lord's licenſe.

Year Day and WASTE. See YEAR *Day and Waſte.*

WASTE *of a ſhip*, is that part of her between the main-maſt, and the fore-maſt. See SHIP, and MAST.

WASTE-BOARDS, are boards ſometimes ſet upon the ſide of a boat, or other veſſel, to keep the ſea from breaking into her.

WATCH, *Guet*, a perſon poſted as a ſpy in any place, to have an eye thereto, and give notice of what paſſes. See CENTINEL, SENTRY, *&c.*

WATCH, is alſo uſed for a *corps de garde* poſted at any paſſage; or a company of guards who go on the patrol. See GUARD. — Some officers are exempted from *watch*, and guard.

In the ſame ſenſe they ſay, *night-watch*, guet de nuit: *watch-word*, mot de guet: *royal-watch*, *city-watch*.

Chevalier de guet, is a name given by the French, to the officer who commands the *royal-watch*, &c.

WATCH, at ſea, ſignifies a meaſure, or ſpace of four hours; becauſe half the ſhip's crew *watch*, and do duty in their turns ſo long at a time.

The ſhip's company is divided into two parts, the *larboard-watch*, and the *ſtarboard-watch*.— The maſter of the ſhip commands the latter, and the chief mate the former.

Sometimes when a ſhip is in harbour, they *watch* but a *quarter-watch*, as they call it; that is, but a quarter of the company *watch* at a time.

The *watch-glaſs*, being four hours, is uſed at ſea to ſhift or change their *watches*.— There are alſo *half-watch* hour-glaſſes; minute and half-minute glaſſes; by which laſt they count the knots when they heave the log, in order to find the ſhip's way. See LOG-*Line*, and KNOT.

Death-WATCH. See the article DEATH.

WATCH, is alſo uſed for a ſmall portable movement, or machine, for the meaſuring of time; having its motion regulated by a ſpiral ſpring. See WATCH-WORK.

Watches, ſtrictly taken, are all ſuch movements as ſhew the parts of time; as clocks are ſuch as publiſh it, by ſtriking on a bell, *&c.* But, commonly, the name *watch* is appropriated to ſuch as are carried in the pocket; and *clock* to the large movements, whether they ſtrike the hour, or not. See CLOCK, and MOVEMENT.

Spring, or *Pendulum* WATCHES, ſtand pretty much on the ſame principle with pendulum clocks; whence their denomination.— If a pendulum, deſcribing little arches of a circle, make vibrations of unequal lengths, in equal times; it is by reaſon it deſcribes the greater with a greater velocity. For the ſame reaſon, a ſpring put in motion, and making greater or leſs vibrations, as it is more ore leſs ſtiff, and as it has a greater or leſs degree of motion given it, performs them nearly in equal times.— Hence, as the vibrations of the pendulum had been applied to large clocks, to rectify the inequality of their motions; ſo, to correct the unequal motions of the balance of *watches*, a ſpring is added; by the iſochroniſm of whoſe vibrations, the correction is to be effected. See PENDULUM.

The ſpring is uſually wound into a ſpiral; that, in the little compaſs allotted it, it may be as long as poſſible; and may have ſtrength enough, not to be maſtered and dragged about by the inequalities of the balance it is to regulate.

The vibrations of the two parts, *viz.* the ſpring and balance, ſhould be of the ſame length; only ſo adjuſted, as that the ſpring, being the more regular in the length of its vibrations than the balance, may, on occaſion, communicate its regularity thereto. See SPRING.

The invention of ſpring, or *pocket-watches*, is owing to the felicity of the preſent age.— It is true, we find mention made of a *watch* preſented to Charles V. in the hiſtory of that prince: but this, in all probability, was no more than a kind of clock to be ſet on a table; ſome reſemblance whereof, we have ſtill remaining in the antient pieces made before the year 1670.

In effect, it is between Dr. Hooke, and M. Huygens, that the glory of this excellent invention lies: but to which of them it properly belongs, is greatly diſputed; the Engliſh aſcribing it to the former; and the French, Dutch, *&c.* to the latter.

Mr. Derham, in his *Artificial Clockmaker*, ſays roundly, that Dr. Hooke was the inventor; and adds, that he contrived various ways of regulation.— One way was with a loadſtone.— Another with a tender ſtreight ſpring, one end whereof played backwards and forwards with the balance; ſo that the balance was to the ſpring, as the bob to a pendulum; and the ſpring as the rod thereof.— A third method was with two balances, of which there were divers ſorts; ſome having a ſpiral ſpring to the balance for a regulator, and others without.

But the way that prevailed, and which continues in mode, was with one balance, and one ſpring running round the upper part of the verge thereof. Though this has a diſadvantage, which thoſe with two ſprings, *&c.* were free from; in that a ſudden jerk, or confuſed ſhake, will alter its vibrations, and put it in an unuſual hurry.

The time of theſe inventions was about the year 1658; as appears, among other evidences, from an inſcription on one of the double balance *watches*, preſented to king Charles II. *viz.* Rob. Hooke Inven. 1658. T. Tompion fecit, 1675. The invention preſently got into reputation, both at home and abroad; and two of them were ſent for by the dauphin of France.

Soon after this, M. Huygens's *watch* with a ſpiral ſpring got abroad, and made a great noiſe in England, as if the longgitude could be found by it.— It is certain, however, that his invention was later than the year 1673, when his book *de Horol. Oſcillat..* was publiſhed; wherein he has not one word of this, though he has of ſeveral other contrivances in the ſame way.

One of theſe the lord Brouncker ſent for out of France, where M. Huygens had got a patent for them.— This *watch* agreed with Dr. Hooke's, in the application of the ſpring to the balance; only M. Huygens's had a longer ſpiral ſpring, and the pulſes and beats were much ſlower, The balance, inſtead of turning quite round, as Dr. Hooke's, turns ſeveral rounds every vibration.

Mr. Derham ſuggeſts, that he has reaſon to doubt M. Huygens's fancy firſt was ſet to work, by ſome intelligence he might have of Dr. Hooke's invention, from Mr. Oldenburg, or ſome other of his correſpondents in England: tho' Mr. Oldenburg vindicates himſelf againſt that charge, in *Philoſophical Tranſactions*, N°. 118, and 129.

Huygens invented divers other kinds of *watches*, ſome of them without any ſtring or chain at all; which he called, particularly, *pendulum watches.*

As it was in England that *watches* had their firſt riſe; ſo it is there, too, they have arrived at their greateſt perfection. — Witneſs that exceeding value put on an Engliſh *watch* in all foreign countries, and that vaſt demand made for them.

M. Savary, in his *Diction. de commerce*, pretends to match the French *watchmakers* againſt the Engliſh.— He aſſerts, "That if the Engliſh be in any condition to diſpute it with "them, they owe it entirely to the great number of French "workmen, who took ſhelter here upon the revocation of "the edict of Nants." He adds, "That three fourths of "the *watches* made in England, are the work of French-"men."— From what authorities he ſays this, we know not: but it need not be told Engliſhmen that it is falſe; there not being one French name, that we know of, among all our famed *watchmakers*: nor, in the body of *watchmakers*, is their one eighth part French.

It is certain the French people prefer our *watches* vaſtly to their own; inſomuch, that to have them with the more eaſe, a number of Engliſh workmen were invited over in 1719, and eſtabliſhed with great countenance at Verſailles, under the direction of the famous Mr. Law.— But the eſtabliſhment, though every thing promiſed well for it, and the French *watch* and clockmakers ſeemed undone by it, fell to the ground in leſs than a year's time.— M. Savary imputes its fall, intirely, to that ſtrong prejudice of the French people, in behalf of the Engliſh workmen, and to the opinion that the *watches* did not come from England. But the truth is, the workmen ſent over being moſt of them men of looſe characters, grew diſſolute, quarrelled with the prieſts, inſulted the magiſtrates, and were diſmiſſed of neceſſity.

Striking WATCHES, are ſuch, as beſides the proper *watch*-part, for meaſuring of time, have a clock-part, for ſtriking the hours, *&c.*

Theſe are real clocks; only moved by a ſpring inſtead of a weight.— Properly ſpeaking, they are called *pocket-clocks.* See CLOCK.

Repeating WATCHES, are ſuch as by pulling a ſtring, *&c.* do repeat the hour, quarter, or minute, at any time of the day or night.

This repetition was the invention of Mr. Barlow, and firſt put in practice by him in larger movements, or clocks, about the year 1676.— The contrivance ſtreight ſet the other artiſts to work, who ſoon contrived divers ways of effecting the ſame.— But its application to pocket-*watches*, was not known before king James the ſecond's reign; when the ingenious inventor abovementioned, having directed Mr. Thompſon to make a *repeating watch*, was ſoliciting a patent for the ſame.

The talk of a patent engaged Mr. Quare to reſume the thoughts of a like contrivance, which he had had in view ſome years before: he now effected it; and being preſſed to endeavour to prevent Mr. Barlow's patent, a *watch* of each kind was produced before the king and council; upon trial of which, the preference was given to Mr. Quare's.

The difference between them was, that Barlow's was made to repeat, by puſhing in two pieces on each ſide the *watch*-box; one of which repeated the hour, and the other the quarter: whereas Quare's was made to repeat by a pin that ſtuck out near the pendant; which being thruſt in, (as now it is done by thruſting in the pendant itſelf) repeated both the hour and quarter with the ſame thruſt. See WATCHWORK.

WATCHING, WAKEFULNESS, *inſomnia*, among phyſicians, denotes a diſorder whereby a perſon is diſabled from going to ſleep. See SLEEP.

It is occaſioned by a continual and exceſſive motion of the animal ſpirits in the organs of the body, whereby thoſe organs are prepared to receive, readily, any impreſſions from external objects, which they propagate to the brain; and furniſh the ſoul with divers occaſions of thinking. See SPIRIT.

This extraordinary flux of ſpirits may have two cauſes: for, 1°. The ſenſible objects may ſtrike the organ with too much force. In which caſe, the animal ſpirits being violently agitated, and thoſe agitations continued by the nerves to the brain, they give a like motion to the brain itſelf; the neceſſary conſequence of which, is, that the animal muſt wake. Thus, a loud ſhriek, pains, head-ach, gripes, coughing, *&c.* cauſe *waking.*— Add, that the ſoul's being oppreſſed with cares, or deeply engaged in thinking, contributes to the ſame: ſince, as it acts by the miniſtry of the ſpirits, any cares or meditations that keep thoſe in motion, muſt produce *watchfulneſs.*— Of this kind are thoſe inveterate *wakings* of melancholic perſons; ſome of whom have been known to paſs three or four weeks without a wink of ſleep. See MELANCHOLY.

2°. The other cauſe is in the ſpirits themſelves; which have ſome extraordinary diſpoſition to receive motion, or to perſiſt in it: as, from their too great heat, or that of the brain in fevers, *&c.*— Hence it is, that the diſorder is moſt frequent in ſummer, in the heat of youth, *&c.*

Long faſting has the ſame effect; the want of food ſubtilizing the ſpirits, and drying the brain.— The ſame is likewiſe an ordinary ſymptom in old age, by reaſon the pores of the brain, and the nerves, having been much widened by the continual paſſage of ſpirits, for a great number of years, the ſpirits now paſs and repaſs through them with too much eaſe, and need not any extraordinary motion to keep the mind awake. See HABIT.

There are inſtances of *waking* for forty-five nights ſucceſſively: and we even read of a melancholy perſon, who never ſlept once in fourteen months.— Such *watchings* uſually degenerate into madneſs. See NARCOTICS, and OPIATE.

WATCH-WORK, is that part of the movement of a clock or watch, which is deſigned to meaſure, and exhibit the time on a dial-plate; in contradiction to that part which contributes to the ſtriking of the hour, *&c.* which is called *clockwork.* See WATCH, and CLOCKWORK.

The ſeveral members of the *watch*-part, are, 1°. The *balance*, conſiſting of the *rim*, which is its circular part; ſee BALANCE; and the *verge*, which is its ſpindle; to which belong the two *pallets* or *leves*, that play in the teeth of the crown-wheel.

2°. The *potence*, or *pottance*, which is the ſtrong ſtud in pocket-*watches*, whereon the lower pivot of the verge plays, and in the middle of which, one pivot of the balance-wheel plays; the bottom of the *pottance* is called the *foot*, the middle part the *noſe*, and the upper part the *ſhoulder*.

3°. The *cock*, which is the piece covering the balance.

4°. The *regulator*, or *pendulum ſpring*, which is the ſmall ſpring in the new pocket-*watches*, underneath the balance. See REGULATOR.

5°. The *pendulum*; whoſe parts are, the *verge*, *pallets*, *cocks*, and the *bob*.

6°. The *wheels*, which are the *crown-wheel*, in pocket-pieces, and *ſwing-wheel* in pendulums; ſerving to drive the balance or pendulum. See CROWN-WHEEL.

7°. The *contrate-wheel*, which is that next the crown-wheel, *&c.* and whoſe teeth and hoop lie contrary to thoſe of other wheels; whence the name.

8°. The *great*, or *firſt wheel*; which is that the fuſy, *&c.* immediately drives: after which are the *ſecond wheel*, *third wheel*, &c.

Laſtly, between the frame and dial-plate, are the *pinion of report*, which is that fixed on the arbor of the great wheel; and ſerves to drive the *dial-wheel*, as that ſerves to carry the *hand*.

Theory, and Calculation of WATCH-WORK.— Preliminaries neceſſary to the calculating of the *watch*-part of a movement, are laid down under the articles BEATS, MOVEMENT, and CLOCKWORK; ſee alſo TURN.

Preliminary rules, common to the calculation of all movements, the *clock* as well as the *watch*-parts; ſee under the article MOVEMENT.— Particular rules for the *ſtriking part*; ſee under the article CLOCKWORK.— Thoſe for the *watch*-part we have from the rev. Mr. Derham, as follow.

1°. The ſame motion, it is evident, may be performed either by one wheel, and one pinion, or many wheels, and many pinions; provided the number of turns of all the wheels bear the proportion to all the pinions, which that one wheel bears to its pinion: or, which is the ſame thing, if the number, produced by multiplying all the wheels together, be to the number produced by multiplying all the pinions together, as that one wheel, to that one pinion.— Thus ſuppoſe you had occaſion for a wheel of 1440 teeth, with a pinion of 28 leaves; you may make it into three wheels of 36 8, and 5, and three pinions of 4, 7, and 1. For the three wheels, 36, 8, and 5, multiplied together, give 1440 for the wheels; and the three pinions 4, 7, and 1, multiplied together, give 28 for the pinions.— Add, that it matters not in what order the wheels and pinions are ſet, or which pinion runs in which wheel; only for contrivance-ſake, the biggeſt numbers are commonly put to drive the reſt.

2°. Two wheels, and pinions of different numbers, may perform the ſame motion.— Thus, a wheel of 36, drives a pinion of 4, the ſame as a wheel of 45, a pinion of 5; or a wheel of 90, a pinion of 10.— The turns of each being 9.

3°. If in breaking the train into parcels, any of the quotients ſhould not be liked; or if any other two numbers to be multiplied together, are deſired to be varied; it may be done by this rule.— Divide the two numbers, by any other two numbers which will meaſure them; multiply the quotients by the alternate diviſors; the product of theſe two laſt numbers found, will be equal to the product of the two numbers firſt given.— Thus, if you would vary 36 times 8, divide theſe by any two numbers which will evenly meaſure them: ſo, 36 by 4, gives 9; and 8 by 1, gives 8: now, by the rule, 9 times 1 is 9, and 8 times 4, 32; ſo that for 36×8, you have 32×9; each equal to 288. If you divide 36 by 6, and 8 by 2, and multiply as before, you have $24 \times 12 = 36 \times 8 = 288$.

4°. If a wheel and pinion fall out with croſs numbers, too big to be cut in wheels, and yet not to be altered by theſe rules; in ſeeking for the pinion of report, find two numbers of the ſame, or a near proportion, by this rule: as either of the two given numbers, is to the other, ſo is 360, to a fourth. Divide that fourth number, as alſo 360, by 4, 5, 6, 8, 9, 10, 12, 15; (each of which numbers exactly meaſures 360) or by any of thoſe numbers that brings a quotient neareſt an integer.— As ſuppoſe you had 147 for the wheel, and 170 for the pinion; which are too great to be cut into ſmall wheels, and yet cannot be reduced into leſs, as having no other common meaſure but unity: ſay, as $170 : 147 :: 360 : 311$. Or, as $147 : 170 :: 360 : 416$. Divide the fourth number, and 360 by one of the foregoing numbers; as 311, and 360 by 6, it gives 52 and 60; divide them by 8, you have 39, and 45: and, if you divide 360 and 416, by 8, you have 45 and 52 exactly. Wherefore, inſtead of the two numbers 147, and 170, you may take 52, and 60; or 39 and 45, or 45 and 52, &c.

5°. To come to practice in calculating a piece of *watch-work*, firſt pitch on the train or beats of the balance in an hour; as, whether a ſwift one, of about 20000 beats, (the uſual train of a common 30 hour *pocket-watch*) or a ſlower, of about 16000, (the train of the new pendulum *pocket-watches*) or any other train.— Next, reſolve on the number of turns the fuſy is intended to have, and the number of hours the piece is to go: ſuppoſe, *e. gr.* 12 turns, and to go 30 hours, or 192 hours, (*i. e.* 8 days) &c. Proceed now to find the beats of the balance or pendulum in one turn of the fuſy, by the direction given under the word BEATS.— Thus in numbers; 12 : 16 : : 20000 : 26666. Wherefore, 26666 are the beats in one turn of the fuſy, or great wheel, and are equal to the quotients of all the wheels into the balance multiplied together.— Now this number is to be broken into a convenient parcel of quotients; which is to be done thus: firſt, halve the number of beats, *viz.* 26666, and you have 13333; then pitch on the number of the crown-wheel, ſuppoſe 17: divide 13333 by 17, and you have 784 for the quotient (or turns) of the reſt of the wheels and pinions; which being too big for one or two quotients, may be beſt broken into three.— Chuſe therefore three numbers; which, when multiplied all together continually, will come neareſt 784: as ſuppoſe 10, 9, and 9, multiplied continually, gives 810, which is ſomewhat too much; therefore try again other numbers, 11, 9, and 8: theſe drawn one into another continually, produce 792; which is as near as can be, and convenient quotients.— Having thus contrived the piece from the great wheel to the balance; but the numbers not falling out exactly, as you firſt propoſed, correct the work thus: firſt, (by the direction given under the word BEATS) multiply 792, the product of all the quotients pitched upon, by 17, (the notches of the crown-wheel) the product is 13464, which is half the number of beats in one turn of the fuſy; then (by a rule given under the word BEATS) find the true number of beats in an hour.— Thus, 16 : 12 : : 13464 : 10098; which is half the beats in an hour.— Then find what quotient is to be laid upon the pinion of report, (by the rule given under that word.)— Thus, 16 : 12 : : 12 : 9, the quotient of the pinion of report.— Having thus found your quotients, it is eaſy to determine what numbers the pinions ſhall have; for, chuſing what numbers the wheels ſhall have, and multiplying the pinions by their quotients, the produce is the number for the wheels.

4) 36 (9
5) 55 (11
5) 45 (9
5) 40 (8
17

— Thus, the number of the pinion of report is 4, and its quotient is 9; therefore the number for the dial-wheel muſt be 4 × 9, or 36: ſo the next pinion being 5, its quotient 11, therefore the great wheel muſt be 5 × 11 = 55; and ſo of the reſt.

Such is the method of calculating the numbers of a 16 hour *watch.*— Which *watch* may be made to go longer, by leſſening the train, and altering the pinion of report.— Suppoſe you would conveniently ſlacken the train to 16000; then, by the rule given under the word BEATS, ſay, As ½ 16000, or 8000 : 13464 : : 12 : 20. So that this *watch* will go 20 hours.— Then for the pinion of report, ſay, (by the rule given under that word) As 20 : 12 : : 12 : 7. So that 7 is the quotient of the pinion of report. And as to the numbers, the operation is the ſame as before; only the dial-wheel is but 28, for its quotient is altered to 7.

4) 28 (7
5) 55 (11
5) 45 (9
5) 40 (8
17

— If you would give numbers to a *watch* of about 10000 beats in an hour, to have 12 turns of the fuſy, to go 170 hours, and 17 notches in the crown-wheel: the work is the ſame, in a manner, as the laſt example; and conſequently thus: As 12 : 170 : : 10000 : 141666, which fourth number is the beats in one turn of the fuſy; its half, 70833, being divided by 17, gives 4167 for the quotients: and becauſe this number is too big for three quotients, therefore chuſe four, as 10, 8, 8, $6\frac{3}{5}$; whoſe product into 17 makes 71808, nearly equal to half the true beats in one turn of the fuſy.— Then ſay, As 170 : 12 : : 71808 : 5069, which is half the true train of your *watch.*— And again, 170 : 12 : : 12 : $\frac{144}{170}$, which expreſſes the pinion of report, and the number of the dial-wheel.— But theſe numbers being too big to be cut in ſmall wheels, they muſt be varied by the fourth rule, above, thus:

As 144 : 170 : : 360 : 425;
Or 170 : 144 : : 360 : 305.

24) 20 ($\frac{20}{24}$
6) 60 (10
6) 48 (8
5) 40 (8
5) 33 ($6\frac{3}{5}$
17

Then dividing 360, and either of theſe two fourth proportionals, (as directed by the rule;) ſuppoſe by 15, you will have $\frac{24}{28}$, or $\frac{20}{24}$; then the numbers of the whole movement will ſtand as in the margin.

Such is the calculation of ordinary *watches*, to ſhew the hour of the day: in ſuch as ſhew minutes, and ſeconds, the proceſs is thus:

1°. Having reſolved on the beats in an hour; by dividing the deſigned train by 60, find the beats in a minute; and accordingly, find proper numbers for the crown-wheel, and quotients, ſo as that the minute-wheel ſhall go round once in an hour, and the ſecond wheel once in a minute.

Suppoſe, *e. gr.* you ſhould chuſe a pendulum of ſix inches to go eight days, with 16 turns of the fuſy; a pendulum of 6 inches vibrates 9368 in an hour; and conſequently, dividing it by 60, gives 156, the beats in a minute. Half theſe ſums are 4684, and 78. Now, the firſt work is to break this 78 into a good proportion, which will fall into one quotient, and the crown-wheel. Let the crown-wheel have 15 notches, then 78, divided by 15, gives 5; ſo a crown-wheel of 15, and a wheel and pinion, whoſe quotient is 5, will go round in a minute to carry a hand to ſhew ſeconds.— For a hand to go round in an hour to ſhew minutes; becauſe there are 60 minutes in an hour, it is but breaking 60 into good quotients, (ſuppoſe 10 and 6, or 8 and $7\frac{1}{2}$, &c.) and it is done.— Thus, 4684 is broken, as near as can be, into proper numbers.— But ſince it does not fall out exactly into the above-mentioned numbers, you muſt correct, (as before directed) and find the true number of beats in an hour, by multiplying 15 by 5, which makes 75; and 75 by 60, makes 4500, which is half the true train.— Then find the beats in one turn of the fuſy; thus, 16 : 192 : : 4500 : 54000; which laſt is half the beats in one turn of the fuſy.

8) 40 (5
15

8) 64 (8
8) 60 ($7\frac{1}{2}$
8) 40 (5
15

— This 54000 being divided by 4500, (the true numbers already pitched on) the quotient will be 12; which not being too big for a ſingle quotient, needs not be divided into more; and the work will ſtand as in the margin.— As to the hour-hand, the great wheel, which performs only one revolution in 12 turns of the minute-wheel, will ſhew the hour; or it may be done by the minute-wheel.

9) 108 (12
8) 64 (8
8) 60 ($7\frac{1}{2}$
8) 40 (5
15

WATER, *Aqua*, in phyſics, a ſimple, fluid, and liquid body; reputed the third of the four vulgar elements. See ELEMENT.

Sir Iſaac Newton defines *water* to be a fluid ſalt, volatile, and void of taſte: but this definition Boerhaave ſets aſide; inaſmuch as *water* is a menſtruum, or diſſolvent of ſalts and ſaline bodies, which does not agree with the notion of its being a ſalt itſelf; inaſmuch as we do not know of any ſalt that diſſolves another. See SALT.

Whether water *be originally fluid?*— Though *water* be defined a *fluid*, it is a point controverted among philoſophers, whether fluidity be its natural ſtate, or the effect of violence: we ſometimes find it appear in a fluid, and ſometimes in a ſolid form; and as the former in our warmer climate is the more uſual, we conclude it the proper one, and aſcribe the other to the extraneous action of cold.— Boerhaave, however, aſſerts the contrary, and maintains *water* to be of the cryſtalline kind; ſince, wherever a certain degree of fire is wanting to keep it in fuſion, it readily grows into a hard glebe, under the denomination of *ice*. See ICE.

Mr. Boyle is much of the ſame ſentiment.— Ice, he obſerves, is commonly reputed to be *water* brought into a preternatural ſtate by cold: but, with regard to the nature of things, and ſetting aſide our arbitrary ideas, it might as juſtly be ſaid, That *water* is ice preternaturally thawed by heat. — If it be urged that ice, left to itſelf, will, upon the removal of the freezing agents, return to *water*; it may be anſwered, that, not to mention the ſnow and ice which lie all ſummer long on the Alps, and other high mountains, even in the torrid zone, we have been aſſured, that, in ſome parts of Siberia, the ſurface of the ground continues more months of the year frozen by the natural temperature of the climate, than thawed by the heat of the ſun; and a little below the ſurface of the ground, the *water* which chances to be lodged in the cavities there, continues in a ſtate of ice all the year round: ſo that when, in the heat of ſummer, the fields are covered with corn, if you dig a foot or two deep, you ſhall find ice, and a frozen ſoil.

No pure water *in all nature.*— *Water*, if it could be had alone, and pure, Boerhaave argues, would have all the requiſites of an element, and be as ſimple as fire; but there is no expedient hitherto diſcovered for making it ſuch.— *Rain-water*, which ſeems the pureſt of all thoſe we know of, is replete with infinite exhalations of all kinds, which it imbibes from the air: ſo that filtered and diſtilled a thouſand times, there ſtill remain fæces.— Further, the *rain-water* gathered from the roofs of houſes, is a lixivium of tyles, ſlate, or the like; impregnated with the dungs and fæces of the animals, birds, &c. depoſited thereon; and the exhalations of numerous other things.— Add, that all the *rain-water* gathered in cities, muſt at leaſt be ſaturated with the ſmoke of a thouſand chimneys, and the various effluvia of numbers of perſons, &c.— Beſide, that there is fire contained in all *water*; as appears from its fluidity, which is owing to fire alone. See FIRE.

As what is in the air neceſſarily mixes itſelf with *water*, it hence appears impoſſible to have ſuch a thing as pure *water*. — If you percolate it through ſand, or ſqueeze it through pumice, or paſs it through any other body of the like kind, you will always have ſalt remaining.— Nor can diſtillation render it pure; ſince it leaves air therein, which abounds in corpuſcles of all ſorts. See AIR.

The pureſt of all *waters* we can any way arrive at, is that diſtilled from ſnow, gathered in a clear, ſtill, pinching night, in ſome very high place; taking none but juſt the outer or ſuperficial part thereof.— By a number of repeated diſtillations, the greateſt part of the earth, and other fæces, may be ſeparated herefrom: and this is what we muſt be contented to call *pure water*.

Mr. Boyle, indeed, relates, that a friend of his, by diſtilling a quantity of *water* an hundred times, found, at length, that he had got ſix tenths of the firſt quantity in earth: Whence he concludes, that the whole *water*, by further proſecuting the operation, might be converted into earth. See EARTH.

But it ſhould be conſidered, that *water* cannot be removed, or poured into a veſſel, without mixing ſome duſt therewith; ſo, neither can the luting of the veſſel be diſtilled, without loſing ſomething every time.— Boerhaave, therefore, rather concludes, that the *water* thus often diſtilled, might acquire ſtill new earth from the duſt floating in the air, and the inſtruments employed in the operation.

That author aſſures us, that after diſtilling ſome very pure *water*, by a gentle fire, the ſpace of four months, it appeared perfectly pure; and yet, leaving it to reſt in veſſels exactly cloſed, it would conceive a ſlender kind of weedy matter, ſomewhat like the ſtamina of plants, or the little tufts of a mucilage: yet Schottus ſaw *water*, in Kircher's muſæum, that had been kept in a veſſel, hermetically ſealed, upwards of fifty years; yet ſtill remained clear and pure, and ſtood to the ſame heighth in the veſſel as at firſt, without the leaſt ſign of ſediment.

Boerhaave adds, that he is convinced nobody ever ſaw a drop of pure *water*; that the utmoſt of its purity known, only amounts to its being free from this or that ſort of matter: and that it can never, for inſtance, be quite deprived of ſalt; ſince air will always accompany it, and air has always ſalt. See AIR, and ATMOSPHERE.

Water *in all places and bodies*.— *Water* ſeems to be diffuſed every where, and to be preſent in all ſpace where there is matter.— Not a body in all nature but will yield *water*: it is even aſſerted, that fire itſelf is not without *water*.— A ſingle grain of the moſt fiery ſalt, which in a moment's time will penetrate through a man's hand, readily imbibes half its weight of *water*, and melts, even in the drieſt air imaginable.— Thus, ſalt of tartar, placed near the hotteſt fire, will attract or imbibe *water*; and, by that means, increaſe conſiderably its weight, in a ſmall time: ſo, in the drieſt ſummer's day, a pewter veſſel with ice in it, brought up from ſome cold ſubterraneous place, into the hotteſt room, will immediately be covered over with little drops of *water*, gathered from the contiguous air, and condenſed by the coldneſs of the ice.

It is ſurprizing to conſider the plenteous ſtock of *water* which even dry bodies afford.— Oil of vitriol, being expoſed a long time to a violent fire, to ſeparate all the *water*, as much as poſſible, from the ſame, will, afterwards, by only ſtanding a few minutes in the air, contract freſh *water* ſo faſt, as ſoon to afford it as plenteouſly as at firſt.— Hartſhorn, kept forty years, and turned as hard and dry as any metal, ſo that if ſtruck againſt a flint, it will yield ſparks of fire; yet, being put into a glaſs veſſel, and diſtilled, will afford one eighth part of its quantity of *water*.— Bones dead and dried twenty-five years, and thus become almoſt as hard as iron; yet, by diſtillation, have afforded half their weight of *water*. — And the hardeſt ſtones, ground and diſtilled, do always diſcover a portion thereof.

Eels, by diſtillation, yielded Mr. Boyle ſome oil, ſpirit, and volatile ſalt, beſides the caput mortuum; yet all theſe were ſo diſproportionate to the *water*, that they ſeemed to have been nothing but that coagulated: the ſame ſtrangely abounds in vipers, though eſteemed very hot in operation; and will, in a convenient air, ſurvive, for ſome days, the loſs of their heads and hearts.— Human blood itſelf, as ſpirituous and elaborate a liquor as it is reputed, ſo abounds in *water*, that out of ſeven ounces and an half, the ſame author, by diſtillation, drew near ſix of phlegm, before ever any of the other principles began to riſe. See PHLEGM.

Whether water *be the common matter of all bodies?*— From conſiderations of this kind, Thales, and ſome other philoſophers, have been led to hold, that all things were made of *water*: which opinion, probably, had its riſe from the writings of Moſes, where he ſpeaks of the ſpirit of God moving upon the face of the *waters*.— But Mr. Boyle does not conceive the *water* here mentioned by Moſes as the univerſal matter, to be our elementary *water*: we need only ſuppoſe it an agitated congeries of a great variety of ſeminal principles, and of other corpuſcles fit to be ſubdued and faſhioned by them; and it may yet be a body fluid like *water*, in caſe the corpuſcles it was made up of were, by their creator, made ſmall enough, and put into ſuch an actual motion, as might make them roll, and glide eaſily over one another.— However, Baſil Valentine, Paracelſus, Van Helmont, Sendivogius, and others, have maintained the ſame principle, *viz.* that *water* is the elemental matter, or ſtamen of all things, and ſuffices alone for the production of all the viſible creation.— Thus Sir Iſaac Newton, "All birds, beaſts, and fiſhes, in-
"ſects, trees, and vegetables, with their ſeveral parts, do
"grow out of *water*, and *watery* tinctures, and ſalts; and,
"by putrefaction, return again to *watery* ſubſtances."

Helmont endeavours to prove this doctrine from an experiment; wherein, burning a quantity of earth, till all the oil was conſumed, and then mixing it up with *water*, to draw out all the ſalt; and putting this earth, thus prepared, into an earthen pot, which nothing but *rain-water* could enter; yet a willow, planted therein, grew up to a conſiderable heighth and bulk, without any ſenſible diminution of the earth: whence he concluded, that the *water* was the only nutriment of the vegetable kind, as vegetables are of the animal.— The ſame thing is inferred by Mr. Boyle, from a parallel experiment: and the whole is countenanced by Sir Iſaac Newton, who obſerves, that *water*, ſtanding a few days in the open air, yields a tincture; which, like that of malt, by ſtanding longer, yields a ſediment, and a ſpirit; but before putrefaction, is fit nouriſhment for animals and vegetables.

But Dr. Woodward endeavours to ſhew the whole a miſtake: *water* containing extraneous corpuſcles, ſome of theſe, he ſhews, are the proper matter of nutrition; the *water* being ſtill found to afford ſo much the leſs nouriſhment, the more it is purified by diſtillation.— Thus, a plant in diſtilled *water* will not grow ſo faſt as in *water* not diſtilled; and if the *water* be diſtilled three or four times over, the plant will ſcarce grow at all, or receive any nouriſhment from it. So that *water*, as ſuch, does not ſeem the proper nutriment of vegetables; but only the vehicle thereof, which contains the nutritious particles, and carries them along with it, through all the parts of the plant. See VEGETATION.

Hence, a *water-plant*, e. gr. a naſturtium, brought up in a veſſel of *water*, will be found to contain the more ſalt and oil, the muddier the *water* is: in effect, *water* nouriſhes the leſs, the more it is purged of its ſaponaceous ſalts; in its pure ſtate, it may ſuffice to extend or ſwell the parts, but affords no new vegetable matter. See VEGETABLE, NUTRITION, &c.

Helmont, however, carries his ſyſtem ſtill further, and imagines, that all bodies may be re-converted into *water*.— His alkaheſt, he affirms, adequately reſolves plants, animals, and minerals, into one liquor, or more, according to their ſeveral internal differences of parts: and the alkaheſt, being abſtracted from theſe liquors, in the ſame weight, and with the ſame virtues as when it diſſolved them, the liquors may, by frequent cohobations from chalk, or ſome other proper matter, be totally deprived of their ſeminal endowments, and return at laſt to their firſt matter, inſipid *water*.

Thus much is confeſſed, that mixed bodies do all reſolve by fire, into phlegm or *water*, oil, ſpirit, ſalt, and earth; each of which is found to contain *water*.

Spirits, for inſtance, cannot be better repreſented, than by ſpirit of wine; which, of all others, ſeems freeſt from *water*: yet, Helmont affirms, it may be ſo united with *water*, as to become *water* itſelf.— He adds, that it is materially *water*; only under a ſulphurous diſguiſe.— According to him, in making Paracelſus's balſamum-ſamech, which is nothing but ſal tartari dulcified, by diſtilling ſpirit of wine from it, till the ſalt be ſufficiently ſaturated with its ſulphur, and till it ſuffers the liquor to be drawn off, as ſtrong as it was poured on; when the ſalt of tartar, from which it is diſtilled, hath retained, or deprived it of the ſulphurous parts of the ſpirit of wine, the reſt, which is incomparably the greateſt part of the liquor, will turn to phlegm. In effect, corroſive ſpirits, according to Mr. Boyle's obſervation, abound in *water*; which may be obſerved, by entangling, and ſo fixing their ſaline parts, as to make them corrode ſome proper body; or elſe by mortifying them with ſome contrary ſalt: which will turn them into phlegm. See SPIRIT.

And as to ſalts; ſalt of tartar well calcined, being laid to liquify in the air, will depoſite an earth; and if it be then committed to diſtillation, will yield a conſiderable quantity of inſipid *water*; inſomuch, that if it be urged with a vehement fire, the ſalt will almoſt all vaniſh, and nothing ſaline remain, either in the *water*, or the earth.— Whence Helmont concludes, that all ſalts might be converted into *water*. Add, that ſea-ſalt, recovered from its own acid ſpirit, and oil of tartar, reſolves into *water*, as much as into oil of tartar. See SALT.

Laſtly, oils run, in great meaſure, into *water*; and it is probable, might be converted wholly into the ſame. See OIL, SULPHUR, &c.

No ſtandard for the weight and purity of water.— *Water* ſcarce numbers 147, and 170, you may take 52, and 60; or 39 and 45, or 45 and 52, *&c.*

5°. To come to practice in calculating a piece of *watch-work*, firſt pitch on the train or beats of the balance in an hour; as, whether a ſwift one, of about 20000 beats, (the uſual train of a common 30 hour *pocket-watch*) or a ſlower, of about 16000, (the train of the new pendulum *pocket-watches*) or any other train.— Next, reſolve on the number of turns the fuſy is intended to have, and the number of hours the piece is to go: ſuppoſe, *e. gr.* 12 turns, and to go 30 hours, or 192 hours, (*i. e.* 8 days) *&c.* Proceed now to find the beats of the balance or pendulum in one turn of the fuſy, by the direction given under the word BEATS.— Thus in numbers; 12 : 16 : : 20000 : 26666. Wherefore, 26666 are the beats in one turn of the fuſy, or great wheel, and are equal to the quotients of all the wheels into the balance multiplied together.— Now this number is to be broken into a convenient parcel of quotients; which is to be done thus: firſt, halve the number of beats, *viz.* 26666, and you have 13333; then pitch on the number of the crown-wheel, ſuppoſe 17: divide 13333 by 17, and you have 784 for the quotient (or turns) of the reſt of the wheels and pinions; which being too big for one or two quotients, may be beſt broken into three.— Chuſe therefore three numbers; which, when multiplied all together continually, will come neareſt 784: as ſuppoſe 10, 9, and 9, multiplied continually, gives 810, which is ſomewhat too much; therefore try again other numbers, 11, 9, and 8: theſe drawn one into another continually, produce 792; which is as near as can be, and convenient quotients.— Having thus contrived the piece from the great wheel to the balance; but the numbers not falling out exactly, as you firſt propoſed, correct the work thus: firſt, (by the direction given under the word BEATS) multiply 792, the product of all the quotients pitched upon, by 17, (the notches of the crown-wheel) the product is 13464, which is half the number of beats in one turn of the fuſy; then (by a rule given under the word BEATS) find the true number of beats in an hour.— Thus, 16 : 12 : : 13464 : 10098; which is half the beats in an hour.— Then find what quotient is to be laid upon the pinion of report, (by the rule given under that word.)— Thus, 16 : 12 : : 12 : 9, the quotient of the pinion of report.— Having thus found your quotients, it is eaſy to determine what numbers the pinions ſhall have; for, chuſing what numbers the wheels ſhall have, and multiplying the pinions by their quotients, the produce is the number for the wheels. — Thus, the number of the pinion of report is 4, and its quotient is 9; therefore the number for the dial-wheel muſt be 4 × 9, or 36: ſo the next pinion being 5, its quotient 11, therefore the great wheel muſt be 5 × 11 = 55; and ſo of the reſt.

4) 36 (9
5) 55 (11
5) 45 (9
5) 40 (8
17

Such is the method of calculating the numbers of a 16 hour *watch.*— Which *watch* may be made to go longer, by leſſening the train, and altering the pinion of report.— Suppoſe you would conveniently ſlacken the train to 16000; then, by the rule given under the word BEATS, ſay, As $\frac{1}{2}$ 16000, or 8000 : 13464 : : 12 : 20. So that this *watch* will go 20 hours.— Then for the pinion of report, ſay, (by the rule given under that word) As 20 : 12 : : 12 : 7. So that 7 is the quotient of the pinion of report. And as to the numbers, the operation is the ſame as before; only the dial-wheel is but 28, for its quotient is altered to 7. — If you would give numbers to a *watch* of about 10000 beats in an hour, to have 12 turns of the fuſy, to go 170 hours, and 17 notches in the crown-wheel: the work is the ſame, in a manner, as the laſt example; and conſequently thus: As 12 : 170 : : 10000 : 141666, which fourth number is the beats in one turn of the fuſy; its half, 70833, being divided by 17, gives 4167 for the quotients: and becauſe this number is too big for three quotients, therefore chuſe four, as 10, 8, 8, $6\frac{3}{5}$; whoſe product into 17 makes 71808, nearly equal to half the true beats in one turn of the fuſy.— Then ſay, As 170 : 12 : : 71808 : 5069, which is half the true train of your *watch.*— And again, 170 : 12 : : 12 : $\frac{144}{170}$, which expreſſes the pinion of report, and the number of the dial-wheel.— But theſe numbers being too big to be cut in ſmall wheels, they muſt be varied by the fourth rule, above, thus:

4) 28 (7
5) 55 (11
5) 45 (9
5) 40 (8
17

As 144 : 170 : : 360 : 425;
Or 170 : 144 : : 360 : 305.

Then dividing 360, and either of theſe two fourth proportionals, (as directed by the rule;) ſuppoſe by 15, you will have $\frac{24}{28}$, or $\frac{20}{24}$; then the numbers of the whole movement will ſtand as in the margin.

24) 20 ($\frac{20}{24}$
6) 60 (10
6) 48 (8
5) 40 (8
5) 33 ($6\frac{3}{5}$
17

Such is the calculation of ordinary *watches*, to ſhew the hour of the day: in ſuch as ſhew minutes, and ſeconds, the proceſs is thus:

1°. Having reſolved on the beats in an hour; by dividing the deſigned train by 60, find the beats in a minute; and accordingly, find proper numbers for the crown-wheel, and quotients, ſo as that the minute-wheel ſhall go round once in an hour, and the ſecond wheel once in a minute.

Suppoſe, *e. gr.* you ſhould chuſe a pendulum of ſix inches to go eight days, with 16 turns of the fuſy; a pendulum of 6 inches vibrates 9368 in an hour; and conſequently, dividing it by 60, gives 156, the beats in a minute. Half theſe ſums are 4684, and 78. Now, the firſt work is to break this 78 into a good proportion, which will fall into one quotient, and the crown-wheel. Let the crown-wheel have 15 notches, then 78, divided by 15, gives 5; ſo a crown-wheel of 15, and a wheel and pinion, whoſe quotient is 5, will go round in a minute to carry a hand to ſhew ſeconds.— For a hand to go round in an hour to ſhew minutes; becauſe there are 60 minutes in an hour, it is but breaking 60 into good quotients, (ſuppoſe 10 and 6, or 8 and $7\frac{1}{2}$, *&c.*) and it is done.— Thus, 4684 is broken, as near as can be, into proper numbers.— But ſince it does not fall out exactly into the above-mentioned numbers, you muſt correct, (as before directed) and find the true number of beats in an hour, by multiplying 15 by 5, which makes 75; and 75 by 60, makes 4500, which is half the true train.— Then find the beats in one turn of the fuſy; thus, 16 : 192 : : 4500 : 54000; which laſt is half the beats in one turn of the fuſy. — This 54000 being divided by 4500, (the true numbers already pitched on) the quotient will be 12; which not being too big for a ſingle quotient, needs not be divided into more; and the work will ſtand as in the margin.— As to the hour-hand, the great wheel, which performs only one revolution in 12 turns of the minute-wheel, will ſhew the hour; or it may be done by the minute-wheel.

WATER, *Aqua*, in phyſics, a ſimple, fluid, and liquid body; reputed the third of the four vulgar elements. See ELEMENT.

Sir Iſaac Newton defines *water* to be a fluid ſalt, volatile, and void of taſte: but this definition Boerhaave ſets aſide; inaſmuch as *water* is a menſtruum, or diſſolvent of ſalts and ſaline bodies, which does not agree with the notion of its being a ſalt itſelf; inaſmuch as we do not know of any ſalt that diſſolves another. See SALT.

Whether water *be originally fluid?*— Though *water* be defined a *fluid*, it is a point controverted among philoſophers, whether fluidity be its natural ſtate, or the effect of violence: we ſometimes find it appear in a fluid, and ſometimes in a ſolid form; and as the former in our warmer climate is the more uſual, we conclude it the proper one, and aſcribe the other to the extraneous action of cold.— Boerhaave, however, aſſerts the contrary, and maintains *water* to be of the cryſtalline kind; ſince, wherever a certain degree of fire is wanting to keep it in fuſion, it readily grows into a hard glebe, under the denomination of *ice*. See ICE.

Mr. Boyle is much of the ſame ſentiment.— Ice, he obſerves, is commonly reputed to be *water* brought into a preternatural ſtate by cold: but, with regard to the nature of things, and ſetting aſide our arbitrary ideas, it might as juſtly be ſaid, That *water* is ice preternaturally thawed by heat. — If it be urged that ice, left to itſelf, will, upon the removal of the freezing agents, return to *water*; it may be anſwered, that, not to mention the ſnow and ice which lie all ſummer long on the Alps, and other high mountains, even in the torrid zone, we have been aſſured, that, in ſome parts of Siberia, the ſurface of the ground continues more months of the year frozen by the natural temperature of the climate, than thawed by the heat of the ſun; and a little below the ſurface of the ground, the *water* which chances to be lodged in the cavities there, continues in a ſtate of ice all the year round: ſo that when, in the heat of ſummer, the fields are covered with corn, if you dig a foot or two deep, you ſhall find ice, and a frozen ſoil.

No pure water *in all nature.*— *Water*, if it could be had alone, and pure, Boerhaave argues, would have all the requiſites of an element, and be as ſimple as fire; but there is no expedient hitherto diſcovered for making it ſuch.— *Rain-water*, which ſeems the pureſt of all thoſe we know of, is replete with infinite exhalations of all kinds, which it imbibes from the air: ſo that filtered and diſtilled a thouſand times, there ſtill remain fæces.— Further, the *rain-water* gathered from the roofs of houſes, is a lixivium of tyles, ſlate, or the like; impregnated with the dungs and fæces of the animals, birds, *&c.* depoſited thereon; and the exhalations of numerous other things.— Add, that all the *rain-water* gathered in cities, muſt at leaſt be ſaturated with the ſmoke of a thouſand chimneys, and the various effluvia of numbers of perſons, *&c.*— Beſide, that there is fire contained in all *water*; as appears from its fluidity, which is owing to fire alone. See FIRE.

As what is in the air neceſſarily mixes itſelf with *water*, it hence appears impoſſible to have ſuch a thing as pure *water*. — If you percolate it through ſand, or ſqueeze it through pumice, or paſs it through any other body of the like kind, you will always have ſalt remaining.— Nor can diſtillation render it pure; ſince it leaves air therein, which abounds in corpuſcles of all ſorts. See AIR.

The pureſt of all *waters* we can any way arrive at, is that diſtilled from ſnow, gathered in a clear, ſtill, pinching night, in ſome very high place; taking none but juſt the outer or ſuperficial part thereof.— By a number of repeated diſtillations, the greateſt part of the earth, and other fæces, may be ſeparated herefrom: and this is what we muſt be contented to call *pure water*.

Mr. Boyle, indeed, relates, that a friend of his, by diſtilling a quantity of *water* an hundred times, found, at length, that he had got ſix tenths of the firſt quantity in earth: Whence he concludes, that the whole *water*, by further proſecuting the operation, might be converted into earth. See EARTH.

But it ſhould be conſidered, that *water* cannot be removed, or poured into a veſſel, without mixing ſome duſt therewith; ſo, neither can the luting of the veſſel be diſtilled, without loſing ſomething every time.— Boerhaave, therefore, rather concludes, that the *water* thus often diſtilled, might acquire ſtill new earth from the duſt floating in the air, and the inſtruments employed in the operation.

That author aſſures us, that after diſtilling ſome very pure *water*, by a gentle fire, the ſpace of four months, it appeared perfectly pure; and yet, leaving it to reſt in veſſels exactly cloſed, it would conceive a ſlender kind of weedy matter, ſomewhat like the ſtamina of plants, or the little tufts of a mucilage: yet Schottus ſaw *water*, in Kircher's muſæum, that had been kept in a veſſel, hermetically ſealed, upwards of fifty years; yet ſtill remained clear and pure, and ſtood to the ſame heighth in the veſſel as at firſt, without the leaſt ſign of ſediment.

Boerhaave adds, that he is convinced nobody ever ſaw a drop of pure *water*; that the utmoſt of its purity known, only amounts to its being free from this or that ſort of matter: and that it can never, for inſtance, be quite deprived of ſalt; ſince air will always accompany it, and air has always ſalt. See AIR, and ATMOSPHERE.

Water *in all places and bodies*.— *Water* ſeems to be diffuſed every where, and to be preſent in all ſpace where there is matter.— Not a body in all nature but will yield *water*: it is even aſſerted, that fire itſelf is not without *water*.— A ſingle grain of the moſt fiery ſalt, which in a moment's time will penetrate through a man's hand, readily imbibes half its weight of *water*, and melts, even in the drieſt air imaginable.— Thus, ſalt of tartar, placed near the hotteſt fire, will attract or imbibe *water*; and, by that means, increaſe conſiderably its weight, in a ſmall time: ſo, in the drieſt ſummer's day, a pewter veſſel with ice in it, brought up from ſome cold ſubterraneous place, into the hotteſt room, will immediately be covered over with little drops of *water*, gathered from the contiguous air, and condenſed by the coldneſs of the ice.

It is ſurprizing to conſider the plenteous ſtock of *water* which even dry bodies afford.— Oil of vitriol, being expoſed a long time to a violent fire, to ſeparate all the *water*, as much as poſſible, from the ſame, will, afterwards, by only ſtanding a few minutes in the air, contract freſh *water* ſo faſt, as ſoon to afford it as plenteouſly as at firſt.— Hartſhorn, kept forty years, and turned as hard and dry as any metal, ſo that if ſtruck againſt a flint, it will yield ſparks of fire; yet, being put into a glaſs veſſel, and diſtilled, will afford one eighth part of its quantity of *water*.— Bones dead and dried twenty-five years, and thus become almoſt as hard as iron; yet, by diſtillation, have afforded half their weight of *water*. — And the hardeſt ſtones, ground and diſtilled, do always diſcover a portion thereof.

Eels, by diſtillation, yielded Mr. Boyle ſome oil, ſpirit, and volatile ſalt, beſides the caput mortuum; yet all theſe were ſo diſproportionate to the *water*, that they ſeemed to have been nothing but that coagulated: the ſame ſtrangely abounds in vipers, though eſteemed very hot in operation; and will, in a convenient air, ſurvive, for ſome days, the loſs of their heads and hearts.— Human blood itſelf, as ſpirituous and elaborate a liquor as it is reputed, ſo abounds in *water*, that out of ſeven ounces and an half, the ſame author, by diſtillation, drew near ſix of phlegm, before ever any of the other principles began to riſe. See PHLEGM.

Whether water *be the common matter of all bodies?*— From conſiderations of this kind, Thales, and ſome other philoſophers, have been led to hold, that all things were made of *water*: which opinion, probably, had its riſe from the writings of Moſes, where he ſpeaks of the ſpirit of God moving upon the face of the *waters*.— But Mr. Boyle does not conceive the *water* here mentioned by Moſes as the univerſal matter, to be our elementary *water*: we need only ſuppoſe it an agitated congeries of a great variety of ſeminal principles, and of other corpuſcles fit to be ſubdued and faſhioned by them; and it may yet be a body fluid like *water*, in caſe the corpuſcles it was made up of were, by their creator, made ſmall enough, and put into ſuch an actual motion, as might make them roll, and glide eaſily over one another.— However, Baſil Valentine, Paracelſus, Van Helmont, Sendivogius, and others, have maintained the ſame principle, *viz.* that *water* is the elemental matter, or ſtamen of all things, and ſuffices alone for the production of all the viſible creation.— Thus Sir Iſaac Newton, “All birds, beaſts, and fiſhes, inſects, trees, and vegetables, with their ſeveral parts, do grow out of *water*, and *watery* tinctures, and ſalts; and, by putrefaction, return again to *watery* ſubſtances.”

Helmont endeavours to prove this doctrine from an experiment; wherein, burning a quantity of earth, till all the oil was conſumed, and then mixing it up with *water*, to draw out all the ſalt; and putting this earth, thus prepared, into an earthen pot, which nothing but *rain-water* could enter; yet a willow, planted therein, grew up to a conſiderable heighth and bulk, without any ſenſible diminution of the earth: whence he concluded, that the *water* was the only nutriment of the vegetable kind, as vegetables are of the animal.— The ſame thing is inferred by Mr. Boyle, from a parallel experiment: and the whole is countenanced by Sir Iſaac Newton, who obſerves, that *water*, ſtanding a few days in the open air, yields a tincture; which, like that of malt, by ſtanding longer, yields a ſediment, and a ſpirit; but before putrefaction, is fit nouriſhment for animals and vegetables.

But Dr. Woodward endeavours to ſhew the whole a miſtake: *water* containing extraneous corpuſcles, ſome of theſe, he ſhews, are the proper matter of nutrition; the *water* being ſtill found to afford ſo much the leſs nouriſhment, the more it is purified by diſtillation.— Thus, a plant in diſtilled *water* will not grow ſo faſt as in *water* not diſtilled; and if the *water* be diſtilled three or four times over, the plant will ſcarce grow at all, or receive any nouriſhment from it. So that *water*, as ſuch, does not ſeem the proper nutriment of vegetables; but only the vehicle thereof, which contains the nutritious particles, and carries them along with it, through all the parts of the plant. See VEGETATION.

Hence, a *water-plant*, e. gr. a naſturtium, brought up in a veſſel of *water*, will be found to contain the more ſalt and oil, the muddier the *water* is: in effect, *water* nouriſhes the leſs, the more it is purged of its ſaponaceous ſalts; in its pure ſtate, it may ſuffice to extend or ſwell the parts, but affords no new vegetable matter. See VEGETABLE, NUTRITION, &c.

Helmont, however, carries his ſyſtem ſtill further, and imagines, that all bodies may be re-converted into *water*.— His alkaheſt, he affirms, adequately reſolves plants, animals, and minerals, into one liquor, or more, according to their ſeveral internal differences of parts: and the alkaheſt, being abſtracted from theſe liquors, in the ſame weight, and with the ſame virtues as when it diſſolved them, the liquors may, by frequent cohobations from chalk, or ſome other proper matter, be totally deprived of their ſeminal endowments, and return at laſt to their firſt matter, inſipid *water*.

Thus much is confeſſed, that mixed bodies do all reſolve by fire, into phlegm or *water*, oil, ſpirit, ſalt, and earth; each of which is found to contain *water*.

Spirits, for inſtance, cannot be better repreſented, than by ſpirit of wine; which, of all others, ſeems freeſt from *water*: yet, Helmont affirms, it may be ſo united with *water*, as to become *water* itſelf.— He adds, that it is materially *water*; only under a ſulphurous diſguiſe.— According to him, in making Paracelſus's balſamum-ſamech, which is nothing but ſal tartari dulcified, by diſtilling ſpirit of wine from it, till the ſalt be ſufficiently ſaturated with its ſulphur, and till it ſuffers the liquor to be drawn off, as ſtrong as it was poured on; when the ſalt of tartar, from which it is diſtilled, hath retained, or deprived it of the ſulphurous parts of the ſpirit of wine, the reſt, which is incomparably the greateſt part of the liquor, will turn to phlegm. In effect, corroſive ſpirits, according to Mr. Boyle's obſervation, abound in *water*; which may be obſerved, by entangling, and ſo fixing their ſaline parts, as to make them corrode ſome proper body; or elſe by mortifying them with ſome contrary ſalt: which will turn them into phlegm. See SPIRIT.

And as to ſalts; ſalt of tartar well calcined, being laid to liquify in the air, will depoſite an earth; and if it be then committed to diſtillation, will yield a conſiderable quantity of inſipid *water*; inſomuch, that if it be urged with a vehement fire, the ſalt will almoſt all vaniſh, and nothing ſaline remain, either in the *water*, or the earth.— Whence Helmont concludes, that all ſalts might be converted into *water*. Add, that ſea-ſalt, recovered from its own acid ſpirit, and oil of tartar, reſolves into *water*, as much as into oil of tartar. See SALT.

Laſtly, oils run, in great meaſure, into *water*; and it is probable, might be converted wholly into the ſame. See OIL, SULPHUR, &c.

No ſtandard for the weight and purity of water.— *Water* ſcarce ever continues two moments exactly of the ſame weight, by reaſon of the air and fire contained therein. Thus, a piece of pure limped ice, laid in a nice balance, never continues in equilibrio.— In effect, the expanſion of *water* in boiling, ſhews what effect the different degree of fire has, on the gravity of *water*.— This makes it difficult to fix the ſpecific gravity of *water*, in order to ſettle its degree of purity; but this we may ſay in the general, that the pureſt *water* we can procure, is that which is 880 times as heavy as air.— However, neither have we any tolerable ſtandard in air; for *water* being ſo much heavier than air, the more water is contained in the air, the heavier of courſe muſt it be: as, in effect, the principal part of the weight of the atmoſphere ſeems to ariſe from the *water*. See AIR, and ATMOSPHERE.

Properties and effects of water.— 1°. *Water* is found the moſt penetrative of all bodies, after fire, and the moſt difficult to confine; ſo that a veſſel through which *water* cannot paſs, may retain any thing. Nor is it any objection, that ſyrups and oils will ſometimes paſs through bodies which will hold *water*; this not being owing to the greater ſubtilty and penetration of their particles, but to the reſin, wherewith the wood of ſuch veſſels abounds, to which oils and ſyrups are as menſtruums; ſo that diſſolving the reſin, they make their way through the ſpaces left thereby: whereas *water*, not acting on reſins, is retained. See RESIN.

And yet, *water* gradually makes its way, even through all woods, and is only retainable in glaſs and metals; nay, it was found by experiment at Florence, that when ſhut up in a ſpherical veſſel of gold, and then preſſed with a huge force, it made its way through the pores even of the gold: ſo that the moſt ſolid body in nature, is permeable to *water*. See GOLD.

Water is even found more fluid than air; a body being reputed more fluid than another, when its parts will find way through ſmaller pores: now air, it is known, will not paſs through leather, as is evident in the caſe of an exhauſted receiver covered therewith; whereas *water* paſſes with eaſe.— Again, air may be retained in a bladder, but *water* oozes through. In effect, it is found, that *water* will paſs through pores ten times ſmaller than air will. See PORE.

It muſt not be omitted, however, that M. Homberg accounts for this paſſage of *water* through the narrow pores of animal ſubſtances which will not admit the air, on another principle, *viz.* its moiſtening and diſſolving the glutinous matter of the fine fibres of the membranes, and rendering them more pliable and diſtractile; which are things that the air, for want of a wetting property, cannot do.— As a proof of this doctrine, he filled a bladder, and compreſſed it with a ſtone, and found no air to come out; but placing the bladder thus compreſſed in *water*, the air eaſily eſcaped. *Hiſt. de l' Acad.* An. 1700. p. 45.

2°. *Water*, then, may even hence, *viz.* from its penetrative power, be argued to enter the compoſition of all bodies, both vegetable, animal, and foſſil; with this peculiar circumſtance, that it is eaſily, and with a gentle heat, ſeparable again from bodies it had united with: which cannot be ſaid of any other body.— Fire, indeed, will penetrate more than *water*; but it is difficult to procure it again from the bodies it is once fixed in, as is evident in red lead, *&c.* See MINIUM, VERMILION, *&c.*

This property of *water*, joined with its ſmoothneſs and lubricity, fits it to ſerve as a vehicle for the commodious and eaſy conveyance of the nutritious matter of all bodies: being ſo fluid, and paſſing and repaſſing ſo readily, it never ſtops up the pores, but leaves room for the following *water*, to bring on a new ſupply of nutritious matter. See NUTRITION.

3°. And yet the ſame *water*, as little coheſive as it is, and as eaſily ſeparated from moſt bodies, will cohere firmly with ſome others, and bind them together into the moſt ſolid maſſes: though it appears wonderful, that *water*, which will be ſhewn an almoſt univerſal diſſolvent, ſhould withal be a great coagulator.

Water, we ſee, mixed up with earth or aſhes, gives them the utmoſt firmneſs and fixity.— The aſhes, *e. gr.* of an animal, incorporated with pure *water* into a paſte, and baked with a vehement fire, grow into a coppel; which is a body remarkable for this, that it will bear the utmoſt effort of a refiner's furnace.— It is, in effect, upon the glutinous nature of *water* alone that our houſes ſtand: for take but this out of wood, and it becomes aſhes; or out of tyles, and they become duſt.

Thus, a little clay dried in the ſun, becomes a powder, which, mixed with *water*, ſticks together again, and may be faſhioned at pleaſure; and this dried again by a gentle fire, or in the ſun, and then baked in a potter's oven, by an intenſe fire, becomes little other than a ſtone.— So the Chineſe earth, whereof our porcelain veſſels are made, which hold all liquors, and even melted lead itſelf, is diluted and wrought up with *water*. See PORCELAIN.

To ſay no more, all the ſtability and firmneſs ſeen in the univerſe, is owing to *water* alone.— Thus, ſtone would be an incoherent ſand, did not *water* bind it together; and thus, again, of a fat gravelly earth, wrought up with *water*, and baked or burnt, we make bricks, tyles, and earthen veſſels, of ſuch exceeding hardneſs and cloſeneſs, that *water* itſelf cannot paſs through them. And theſe bodies, though to appearance perfectly dry, and deſtitute of *water*, yet, being pulverized and put in a retort, and diſtilled, yield an incredible quantity of *water*.

The ſame holds of metals; for the parings or filings of lead, tin, antimony, *&c.* by diſtillation, yield *water* plentifully; and the hardeſt ſtones, ſea-ſalt, nitre, vitriol, ſulphur, *&c.* are found to conſiſt chiefly of *water*, into which they reſolve by force of fire.

The *lapis calcarius*, or lime-ſtone, being expoſed to the fire, affords a prodigious quantity of pure *water*; and the more of this *water* is expreſſed, the more friable does it become, till at length it commences a dry calx or lime, wherein, in lieu of the *water* ſo expelled, the fire, in the courſe of calcination, enters; which is expelled again, in its turn, by pouring on cold *water*. Yet, the ſame *water* and calx, tempered together, produce a maſs ſcarce inferior, in point of ſolidity, to the primitive lime-ſtone. See LIME, MORTAR, *&c.*

4°. That *water* is not elaſtic, is evident hence, that it is incompreſſible, or incapable, by any force, of being reduced into leſs compaſs: this eaſily follows from that famous experiment abovementioned, made by order of the great duke of Tuſcany.— The *water*, being incapable of condenſation, rather than yield, tranſmuted through the pores of the metal, ſo that the ball was found wet all over the outſide; till at length, making a cleft in the gold, it ſpun out with great vehemence.— From this laſt circumſtance, indeed, ſome have weakly concluded it was elaſtic. For the impetus wherewith the *water* darted forth, was more probably owing to the elaſticity of the gold, which communicated that impreſſion to the *water*.

And hence we ſee the reaſon why blocks of marble ſometimes burſt in cold weather; and why a veſſel filled with *water*, and afterwards, by any means, reduced to a leſs compaſs, burſts the veſſel, though ever ſo ſtrong.— This is obſervable in a piece of braſs cannon, which being filled with *water*, and the mouth exactly ſtopped, ſo as to prevent all egreſs of *water*; if a cold night happens, ſufficient to contract and conſtipate bodies; the metallic matter undergoing the common fate, and the *water* refuſing to give way, the cannon is burſt aſunder with incredible violence.

Some bring an argument for the elaſticity of *water* hence, that hot *water* takes up more room than cold; but no legitimate concluſion can be formed from hence: for in the hot *water* there is a good quantity of fire contained, which interpoſing between the particles of the *water*, makes it extend to a greater ſpace, without any expanſion of parts from its own elaſticity. This is evident hence, that if *water* be once heated, there is no reducing it to its former dimenſions, but by letting it cool again: which plainly ſhews, that the expanſion depends not on the elaſticity of parts, but on the preſence of fire.— *Water*, then, though incapable of compreſſion or condenſation, may yet be rarefied by heat, and contracted by cold. See RAREFACTION, *&c.*

It may be added, that a further degree of cold, that is, ſuch a one as congeals *water*, or turns it into ice, does expand it. — There are other ways to manifeſt this expanſion of *water*, by freezing.— Mr. Boyle having poured a proper quantity of *water* into a ſtrong cylindrical earthen veſſel, expoſed it, uncovered, both to the open air in froſty nights, and the operation of ſnow and ſalt; and found, that the ice produced in both caſes, reached higher than the *water* before it was froze. Add, that it has been found, that the rain ſoaking into marble, and violent froſts coming on, have burſt the ſtones: and even implements made of bell-metal, careleſly expoſed to the wet, have been broken and ſpoiled by the *water*; which entering at little cavities of the metal, was there afterwards froze, and expanded into ice.

From the whole we may be enabled to ſettle ſomething, as to the nature of the component particles of *water*; and, 1°. That they are, as to our ſenſes, infinitely ſmall; whence their penetrative power: 2°. Exceedingly ſmooth and ſlippery, void of any ſenſible aſperities; witneſs their fluidity, and their being ſo eaſily ſeparable from other bodies which they adhere to: 3°. Extremely ſolid: 4°. Perfectly tranſparent, and as ſuch inviſible; which we gather hence, that pure *water*, incloſed in a veſſel hermetically ſealed, projects no ſhadow; ſo that the eye ſhall not be able to diſcover whether the veſſel have *water* in it or not; and in that the cryſtals of ſalts, when the *water* is ſeparated from them, loſe their tranſparency.— 5°. Hard, rigid, and inflexible; as appears from their not being compreſſible.— If it be aſked, how a body ſo light, fluid, and volatile, and which ſo eaſy a fire ſuffices to rarefy, ſhould be ſo ſtubborn and incompreſſible? We ſee no other cauſe to aſſign, but the homogeneity of its parts.— If *water* be conſidered as conſiſting of ſpherical, or cubical particles, hollow withinſide, and of a firm texture; here will be enough to account for the whole: Its firmneſs and ſimilarity will make it reſiſt ſufficiently; and its vacuity renders it light enough, *&c* — The little contact between ſpherules, will account for the weakneſs of its coheſion, *&c.* See PARTICLE, COHESION, *&c.*

Salt melted in *water*, does not fill the veſſel in proportion to its own bulk: whence it follows, that there are little ſpaces between the particles of water, to admit thoſe of the ſalt.— And hence, again, we gather, that the *watry* particles are extremely ſolid and inflexible; ſince, though they have intermediate ſpaces, no force or weight can compreſs, or crowd them nearer. See SALT.

5°. *Water* is the moſt inſipid of all bodies; the taſte we ſometimes obſerve therein, ariſing not from the mere *water*; but from ſalt, vitriol, or other bodies mixed therewith: and accordingly, all the ſapid *waters*, recommended for medicinal uſes, are found to depoſite a quantity of ſome of thoſe foſſils.

6°. *Water* is perfectly inodorous, or void of the leaſt ſmell. — *Water*, then, neither affects ſight, taſte, nor ſmell, provided it be pure; and conſequently might remain for ever imperceptible to us, but for the ſenſe of feeling.

Whether water *be convertible into air?*— It has been diſputed, whether or no *water* be convertible into air; there being numerous inſtances of, at leaſt, an apparent tranſmutation.— In the vapours daily raiſed, we find *water* rarefied to ſuch a degree, as to take place in the atmoſphere, and help to compoſe a conſiderable part of what we call *air*; and even to contribute to many of the effects aſcribed to the air. See VAPOUR, AIR, and ATMOSPHERE.— But ſuch a vapour-air has not the characters of true permanent air, being eaſily reducible into *water* again. So, in digeſtions and diſtillations, though *water* may be rarefied into vapours, yet it is not really changed into air, but only divided by heat, and diffuſed into very minute parts; which, meeting together, preſently return to ſuch *water* as they conſtituted before.

Yet, *water* rarefied into vapour in an æolipile, will, for a while, have an elaſtic power, the great and laſt characteriſtic of true air, and ſtream out perfectly like a blaſt of air: The elaſtic power of this ſtream, is manifeſtly owing to nothing elſe but the heat, that expands and agitates the aqueous particles thereof; and when the heat is gone, the elaſticity, and other aerial properties diſappear likewiſe. See ELASTICITY.

Rapid winds thus made, ſeem to be no more than mere *water*, broke into little parts, and put into motion; ſince, by holding a ſolid, ſmooth, and cold body againſt it, the vapours condenſing thereon, will preſently cover the body with *water*.— Indeed, though no heat intervenes, motion alone, if vehement, may perhaps ſuffice to break *water* into minute parts, and make them aſcend upwards in form of air.— Mr. Boyle obſerves, that between Lyons and Geneva, where the Rhone is ſuddenly ſtraitened by two rocks very near each other, that rapid ſtream, daſhing with great impetuoſity againſt them, breaks part of its *water* into minute corpuſcles, and gives it ſuch a motion, that a miſt may be obſerved at a conſiderable diſtance, ariſing from the place, and aſcending high into the air.

WATER, in geography and hydrography, is a common, or general name applied to all liquid tranſparent bodies, gliding or flowing on the earth. See FLUID, LIQUID, *&c.*

In this ſenſe, *water* and earth are ſaid to conſtitute our terraqueous globe. See EARTH.

Some authors have raſhly and injuriouſly taxed the diſtribution of *water* and earth in our globe as unartful, and not well proportioned: ſuppoſing that the *water* takes up too much room. See TERRAQUEOUS.

An inundation, or overflowing of the *waters*, makes a deluge. See DELUGE.

Cataract of WATER. See the article CATARACT.

Water is diſtinguiſhed, with regard to the places where it is found, into marina, *ſea-water*; pluvialis, *rain-water*; fluviatilis, *river-water*; fontana, *ſpring-water*; putealis, *well-water*; ciſternina, that of *ciſterns*; paluſtris, that of *lakes*, *moraſſes*, &c.— which are each more impure, and heterogeneous than other.

Sea-WATER, is an aſſemblage of bodies, wherein *water* can ſcarce be ſaid to have the principal part: it is an univerſal colluvies of all the bodies in nature, ſuſtained and kept ſwimming in *water*, as a vehicle. See SEA, OCEAN, *&c.*

Dr. Liſter conſiders it as the fund or ſource, out of which all bodies ariſe. He gives, in ſome meaſure, into the opinion of Thales, and Van Helmont; and imagines the *ſea-water* to have been the only element created at the beginning, before any animal, or vegetable; or even before the ſun himſelf. — *Freſh-water*, he ſuppoſes to have roſe accidentally after the creation of theſe, and to owe its origin to the vapours of plants, the breath of animals, and the exhalations raiſed from the ſun. *De Font. Med. Ang.*

Dr. Halley is of another opinion.— He takes it for granted, that the ſaltneſs of the ſea, ariſes from the ſaline matter diſſolved and imbibed by the rivers in their progreſs, and diſcharged, with their *waters*, into the ocean; and conſequently, that the degree of ſaltneſs is continually and gradually increaſing.— On this hypotheſis, he even propoſes a method for determining the age of the world: for two experiments of the degree of ſaltneſs, made at a large interval of time, will, by the rule of proportion, give the time wherein it has been acquiring its preſent degree. *Philoſ. Tranſact.* N°. 344.

The *water* of the ſea is liable to ſeveral periodical changes. See TIDES.

High-WATER. }
Low-WATER. } See the articles FLUX, EBB, *&c.*
Ebb-WATER. }

Rain-WATER, is the *water* of the ſea, purified by a ſort of diſtillation: or rather, it is the *watery* vehicle, ſeparated from the ſaline, and other matters reſiding therein, by evaporation. See RAIN, and EVAPORATION.

The *water* which deſcends in rain and ſnow, is, of all others, the pureſt, in a cold ſeaſon, and a ſtill ſky; and this we muſt be contented to take for elementary *water*.

The *rain-water*, in ſummer, or when the atmoſphere is in commotion, it is certain, muſt contain infinite kinds of heterogeneous matter: Thus, gathering the *water* that falls after a thunder-clap, in a ſultry ſummers day, and letting it ſettle, a real ſalt is found ſticking at the bottom. But in winter, eſpecially when it freezes, the exhalations are but few, ſo that the rain falls without much adulteration: and hence, what is thus gathered in the morning-time, is found of good uſe for taking away ſpots in the face; and that gathered from ſnow, againſt inflammation of the eyes. See SNOW.

Yet this *rain-water*, with all its purity, may be filtered and diſtilled a thouſand times, and it will ſtill leave ſome fæces behind it.

Spring-WATER is the next, in point of purity.— This, according to Dr. Halley, is collected from the air itſelf; which being ſatured with *water*, and coming to be condenſed by the evening's cold, is driven againſt the cold tops of the mountains; where, being further condenſed and collected, it gleets down, or diſtils, much as in an alembic. See SPRING, *&c.*

This *water*, which before floated in the atmoſphere, in form of a vapour, being thus brought together, at firſt forms little ſtreams; ſeveral of which meeting together, form rivulets; and theſe, at length, rivers.

River-WATER, on ſome occaſions, is to be eſteemed purer than that of ſprings.— If the ſtream, in deſcending from its ſpring, chance to flow over ſtrata, or beds, wherein there is ſalt, ſulphur, vitriol, iron, or the like, it diſſolves and imbibes part thereof.— Otherwiſe, ſpring-*water* becomes purer and better; for while the river drives on its *waters* in an uninterrupted ſtream, all its ſalts, with the vegetable and animal matters drained into it, either from exhalations, or from the ground it waſhes, gradually either ſink to the bottom, or are driven to the ſhore: and hence, the antient poets and painters repreſent the deities of ſprings and rivers, as combing and carding their *waters*. See RIVER.

With regard to the qualities of *water*, it is further diſtinguiſhed into ſalina, *ſalt-water*; dulcis, *freſh-water*, &c.

Salt-WATER, or *Sea*-WATER. See SALT, and SEA-*Water*.

Freſh-WATER.— It is generally granted, that thoſe *waters*, cæteris paribus, are the beſt, as well for wholſomneſs, as various other œconomical uſes, *&c.* that are freeſt from ſaltneſs; which is an adventitious, and, in moſt caſes, a hurtful quality in *waters*.— Mr. Boyle, therefore, contrived a very extraordinary method of examining the freſhneſs and ſaltneſs of *waters*, by a precipitant, which could diſcover one part of ſalt in 1000, nay, 2 or 3000 parts of *water*. See FRESH-*Water*.

The thawed ice of ſea-*water* is often uſed in Amſterdam for brewing; and Bartholine, in his book *De Nivis Uſu*, confirms the relation: “ It is certain, ſays he, that if the ice of the ſea-*water* be thawed, it loſes its ſaltneſs; as has been lately tried by a profeſſor in our univerſity.”

Uſes of WATER.— The uſes of *water* are infinite; in food, in medicine, in agriculture, in navigation, in divers of the arts, *&c.*

As a *food*, it is one of the moſt univerſal drinks in the world; and, if we may credit many of our lateſt and beſt phyſicians, one of the beſt too.— For this uſe, that which is pureſt, lighteſt, moſt tranſparent, ſimple, colourleſs, void of taſte and ſmell, and which warms and cools faſteſt, and wherein herbs and pulſe infuſe and boil the ſooneſt, is beſt. See DRINK.

Hippocrates, in his treatiſe *De Aëre, Aquis & Locis*, ſpeaks much in behalf of light *water*.— Herodotus relates, that, among the antients, ſome nations drank a *water* ſo very light, that all woods readily ſunk therein.— And Mr. Boyle mentions ſome *water* brought out of Africa into England, which was ſpecifically lighter than ours, by four ounces in a pint, *i. e.* by one third. See WATERPOISE.

It is eſteemed a good quality in *water*, to bear ſoap, and make a lather therewith.— This our river-*waters* readily do, but the pump and ſpring-*waters* are found too hard for it; yet may theſe be remedied, by barely letting them ſtand for four or five days.

As a *medicine*, it is found, internally, a powerful febrifuge; excellent againſt colds, coughs, ſtone, ſcurvy, *&c.* See FEBRIFUGE, *&c.* — Externally, its effects are no leſs conſiderable. See BATH.

In *agriculture*, and gardening, *water* is allowed abſolutely neceſſary to vegetation; whence Varro places it in the number of the divinities he invokes in his firſt book *de re Ruſtica: Etiam*, ſays he, *precor lympha, quoniam ſine aqua omnis miſera eſt agricultura.* See WATERING.

The changes *water* is liable to, and the different forms it appears under, are numerous.— Sometimes as ice, then as a vapour, then as a cloud, ſhower, ſnow, hail, fog, *&c.* See ICE, VAPOUR, CLOUD, SHOWER, SNOW, HAIL, FOG, FREEZING, *&c.*

Many naturaliſts have even maintained *water* to be the vegetable matter, or the only proper food of plants; but Dr. Woodward has overturned that opinion, and ſhewn, that the office of *water* in vegetation, is only to be a vehicle to a terreſtrial matter, whereof vegetables are formed; and does not itſelf make any addition to them.— All *water*, he allows, contains more or leſs of this terreſtrial matter; ſpring and rain-*water* near an equal quantity, and river-*water* more than either of them. See VEGETATION.

Water is of the laſt uſe in chymiſtry; being one of the great inſtruments by means whereof its operations are all performed. See CHYMISTRY, and OPERATION.

It acts in various manners and capacities; as a menſtruum, a ferment, a putrefacient, a vehicle, a medium, *&c.*

1°. As a *menſtruum*, it diſſolves all kinds of ſalts. See SALT, DISSOLVENT, DISSOLUTION, *&c.*— Air alſo ſeems to diſſolve ſalts; but it is only by virtue of the *water* it contains.— Nor has any other body the power of diſſolving ſalts, further than as it ſhares in this fluid. See AIR, *&c.*

The particles of ſalts, we have obſerved, inſinuate themſelves into the interſtices between the particles of *water*; but when thoſe interſtices are once filled, the ſame *water* will not any longer diſſolve the ſame ſalt; but it will diſſolve a ſalt of another kind, by reaſon of the different figure of the particles, which enter and occupy the vacancies left by the former: and thus it will diſſolve a third, or fourth ſalt, *&c.*— So, when *water* has imbibed its fill of common ſalt, it will ſtill diſſolve nitre; and when ſaturated with nitre, it will diſſolve ſal armoniac, and ſo on.

Water alſo diſſolves all ſaline bodies, it being the conſtituent character of this claſs of bodies, that they are uninflammable, and diſſoluble in *water*.— Hence, *water* may diſſolve all bodies, even the heavieſt and moſt compact, as metals; inaſmuch as thoſe are capable of being reduced into a ſaline form: in which ſtate they may be ſo intimately diſſolved by *water*, as to be ſuſtained therein.

Water diſſolves all ſaponaceous bodies, *i. e.* all alkalious ſalts and oils blended together: though oil itſelf be not diſſoluble in *water*, the admixture of ſalt herewith, rendering it ſaline, brings it under the power of *water*.

Now, all the humours in the human body are apparently ſaline, though none of them are ſalt itſelf; and the ſame may be ſaid of the juices of all vegetables, excepting the oils; and accordingly, they all diſſolve in *water*.

Water diſſolves glaſs itſelf.— This being melted with ſalt of tartar, becomes ſoluble in *water*. See GLASS.

It diſſolves all gums, and gummous bodies; it being a characteriſtic of a gum, that it diſſolves in *water*; in contradiſtinction from a *reſin*. See GUM, *&c.*

Further, *water* mixed with alkali ſalts, diſſolves oil and oily bodies. — Thus, though mere *water* poured on greaſy wool, be repelled thereby; yet a ſtrong lixivium, or alkali ſalt being mixed with the *water*, it readily diſſolves and abſorbs all that was greaſy and oleaginous: and thus it is that woollen cloths are ſcoured.

But, *water* does not diſſolve reſins; as we conceive a reſin to be no other than an inſpiſſated, or concentrated oil. See RESIN.

Oils and ſulphurs *water* leaves untouched; and what is more extraordinary, it repels them; and by repelling, drives the oily particles into eddies.— Add, that it ſeems to repel all oleaginous, ſulphurous, fatty, and adipous bodies, wherein oil predominates; and hence alſo it is, that the fatty parts in our bodies eſcape being diſſolved by *water*.— And it is, in all probability, by this means that fat is collected in the adipoſe cells of all animals. See FAT.

Nor does it diſſolve terrene or earthy bodies, but rather unites and conſolidates them; as we ſee in tyles, *&c.* See EARTH.

After diſſolving a body, the *water* unites and hardens together with it; and, if the body be of the ſaline kind, forms cryſtals, and retains the ſalts in that form. See CRYSTAL.

Salts, while thus joined with *water*, aſſume various figures; the cryſtals of ſea-ſalt, *e. gr.* are pyramidal; thoſe of nitre, priſmatical; thoſe of ſal gemmæ, cubical, *&c.* But, that *water* is the cauſe of theſe ſalts being in cryſtals, is evident hence, that upon ſeparating the *water*, the cryſtals are no more; their form is loſt, and their tranſparency ceaſes. See CRYSTALLIZATION.

2°. Without *water*, there can no fermentation be raiſed.— Thus, if you grind a plant into a duſt, or farina, it will never ferment; even though you add yeaſt, or ſpirit of wine thereto: but *water* being poured on it, the fermentation readily ariſes. See FERMENTATION.

3°. All putrefactions, both of animal and vegetable bodies, are likewiſe performed by means of *water* alone; and without it, there would be no ſuch effect in all nature. See PUTREFACTION.

4°. *Water* is indiſpenſibly required to efferveſſence; which is an inteſtine motion, ariſing between contrary ſalts: for no ſuch motion can ariſe from a mixture of contrary ſalts, unleſs there be *water* to diſſolve and keep them in ſolution.

5°. A farther uſe is in the making ſeparations of oily from ſaline parts, which is a thing of the laſt ſervice: thus, any oleaginous ſubſtance, incorporated with ſalt, being ſhook ſome time in a proper quantity of *water*, the ſalts diſſolving, will be extracted from the oil, and imbibed by the *water*: and thus is the body dulcified.— So butter, by a continued lotion in fair *water*, becomes inſipid; and aromatic oils, agitated a long time in warm *water*, lay aſide their ſaline ſpirituous parts, and become inert, and inodorous.

Spirit of wine, mixed with oil, makes one body therewith; but if you pour *water* thereon, it will repel the oil, and draw all the ſpirit to itſelf: nay, frequently, what the ſpirit had diſſolved in other bodies, *water* will ſeparate from them, by diluting the ſpirit, and letting the other matters precipitate.

6°. *Water* is of great ſervice in directing and determining the degree of fire, or heat.— This was firſt diſcovered by M. Amontons, from an obſervation, that *water* over the fire grows gradually more and more hot, till it comes to boil; but then ceaſes to increaſe, and only maintains its preſent degree of heat, even though the fire were ever ſo much enlarged, or were continued ever ſo long.— This, therefore, affords a ſtandard, or fixed degree of heat all over the world; boiling *water*, provided it be equally pure, being of the ſame heat in Greenland, as under the equator.

By means hereof, they make baths of divers degrees of heat, accommodated to the various occaſions. See BATH, FIRE, HEAT, *&c.*

Water is of the utmoſt uſe in divers of the mechanical arts, and occaſions of life; as, in the motion of mills, and other machines.— And the laws, properties, *&c.* of this fluid with reſpect thereto; as its motion, gravitation, preſſion, elevation, action, *&c.* And the conſtruction of divers engines ſubſervient thereto, or founded thereon; as ſiphons, pumps, *&c.* make the ſubject of *hydraulics*, and *hydroſtatics.* See HYDRAULICS, FLUID, ASCENT, &c.

The quantity of *water* on this ſide our globe, Dr. Cheyne ſuſpects to be daily decreaſing; " ſome part thereof being
" continually turned into animal, vegetable, metalline, or
" mineral ſubſtances; which are not eaſily diſſolved again
" into their component parts.— Thus, if you ſeparate a few
" particles of any fluid, and faſten them to a ſolid body, or
" keep them aſunder one from another, they are no fluid;
" to produce fluidity, a conſiderable number of ſuch particles
" is required." See FLUIDITY.

" Moſt of the fluids or liquids we know of, are formed by
" the coheſion of particles of different figures, magnitudes,
" gravities, and attractive powers, ſwimming in pure *water*,
" or an aqueous fluid; which ſeems to be the common baſis
" of all.— Wine is only *water* impregnated with particles of
" grapes; and beer with particles of barley: all ſpirits ſeem
" to be nothing but *water*, ſaturated with ſaline or ſulphur-
" ous particles: and all liquids are more or leſs fluid, accord-
" ing to the greater or ſmaller coheſion of the particles,
" which ſwim in the aqueous fluid.— And there is hardly
" any fluid without this coheſion of particles: not even pure
" *water* itſelf; as is apparent from the bubbles which ſome-
" times will ſtand on its ſurface, as well as on that of ſpirits,
" and other liquors." *Philoſoph. Princip. of Relig.*

WATER, in natural hiſtory, *&c.* is diſtinguiſhed into *pure*, called alſo *elemental*; *mineral*; and *artificial*, or *factitious*.

As to the *pure*, we have already obſerved, that there is, perhaps,

haps, none abſolutely ſo: all *water* being found to contain more or leſs particles ſuch as thoſe in terreſtrial bodies; not earthly particles, we mean, but oils, ſalts, &c.

Mineral WATERS, are thoſe which contain ſuch, and ſo many particles of different nature from *water*, as thence to derive ſome notable property beyond what common *water* has: or, *mineral waters* are thoſe which have contracted ſome virtue extraordinary, by paſſing through beds of minerals, as allum, vitriol, ſulphur, &c. or by receiving the fumes thereof. See MINERAL.

The kinds of *mineral waters* are various, as are the kinds of compoſitions of the minerals they are impregnated withal. See FOSSIL.

Some are *ſimple*, as only containing mineral particles of one ſort; others *mixed*, of two, three, four, or more ſorts.

Hence, we have, 1°. *Metallic waters*, in different parts, *golden*, *ſilver*, *copper*, *tin*, *leaden*, and *iron waters*. See METAL, FERRUGINOUS, CHALYBEAT, &c.

2°. *Saline waters*, viz. *nitrous*, *aluminous*, *vitriolate*, and thoſe of common ſalt. See SALT.

3°. *Bituminous*, *ſulphurous*, *antimonial*, *carbonaceous*, and *amber waters*. See BITUMEN, &c.

4°. *Earthy* and *ſtony waters*, viz. *lime*, *chalk*, *oker*, *cinnabar*, *marble*, and *alabaſter waters*.

To which ſome add *mercurial waters*. See MERCURY, &c.

This diviſion of *mineral waters*, is taken from their eſſences; that is, from the mineral particles they contain: but the moſt uſual and celebrated diviſion, is borrowed from the manner wherein they affect our ſenſes; with regard to which there are ten kinds; *viz. acid*, *bitter*, *hot*, *cold*, *oily*, and *fat*, *poiſonous*, *coloured*, *boiling*, *petrifying*, *incruſtating*, and *ſaline*.

Acid WATERS, called alſo *acidulæ*, ariſe from the admixture of vitriol, nitre, allum, and ſalt.— Theſe are cold, and very frequent, there being not reckoned leſs than 1000 in Germany alone: ſome of which are ſaid to be ſour as vinegar, and uſed inſtead thereof; others vinous, and ſerving for wine; others aſtringent, &c. See ACIDULÆ.

Hot WATERS, called *thermæ*, ariſe from the admixture of ſulphurous particles and fumes.— Of theſe, the hotteſt is that in Japan, which, it is ſaid, no fire can bring *water* to equal; and which keeps hot thrice as long as our boiled *water*. See THERMÆ, &c.

Oily, and *Fat* WATERS, ariſe from a bituminous and ſulphurous matter; as amber, petroleum, pitch, naphtha, &c. See NAPHTHA, PETROL, &c.

Bitter WATERS, are produced from an impure ſulphur, bitumen, nitre, and copper.— Such is the lacus aſphaltites.

Very cold WATERS, have their riſe from a mixture of nitre and allum; or of mercury, iron, &c. The depth of the ſource or ſpring too, have ſome effect.

WATERS *which change the nature of bodies*.— Of theſe there is great variety.

1°. Near Armagh in Ireland, is a lake, wherein a ſtaff being fixed ſome months, the part that ſtuck in the mud will be turned into iron; and that part incompaſſed with the *water* into hone; the reſt remaining as before.— Thus Gyraldus, and Maginus; but Brietius denies it.

2°. In the northern part of Ulſter is a ſpring, which, in the ſpace of ſeven years, petrifies wood, or converts it into ſtone.— The like are found in divers other parts, as in Hungary, Burgundy, &c. Vitruvius mentions a lake in Cappadocia, which converts wood into ſtone in one day. See PETRIFACTION.

3°. There are alſo *waters* ſuppoſed to tranſmute, or turn iron into copper. See TRANSMUTATION.

4°. Others are ſaid to change the colour of the hair.— Gyraldus mentions a ſpring in Ireland, wherein if a perſon were waſhed, he inſtantly became grey. See HAIR.

Poiſonous WATERS, are occaſioned by their creeping through arſenical, antimonial, and mercurial earths; or being impregnated by their fumes.— Such is the lacus aſphaltites, and divers others about the Alps, &c. which immediately kill thoſe who drink of them: but theſe are moſt of them filled up with ſtones; which is one reaſon ſo few are known.

Saline WATERS, are generated two ways; either they are derived from the ſea, by ſome ſubterraneous paſſage; or are generated from mineral ſalts, which they meet withal in their paſſage, ere they arrive at their ſprings. See SEA, and SALT.

Boiling, or *Bubbling* WATERS, are produced either by a ſulphurous, or a nitrous ſpirit, mixed with the *water* in the earth: if it be ſulphurous, the *water* is hot; if nitrous, cold. For all the *waters* that boil as if hot are not ſo, but ſome few are cold: we read both of thermæ and acidulæ that boil.

There are divers other *waters* which have very ſingular properties not reducible to any of theſe claſſes: ſuch— 1°. is that ſpring in Portugal, which abſorbs all bodies caſt into it, though the lighteſt: and not far from it there was anciently another, in which no bodies, not the heavieſt, could ſink. — 2°. In Andaluſia, we are aſſured by Euſeb. Nierembergenſis, there is a lake which foretels approaching ſtorms, by making a terrible bellowing, that may be heard 18 or 20 miles diſtance— 3°. In Granada is a well, whoſe *water* diſſolves ſtones.— 4°. We read of a ſpring in Arcadia, which rendered thoſe who drank of it abſtemious.— In the iſland of Chio is a ſpring, which converts thoſe who drink of it into fools.— 6°. There are ſprings in divers parts of England, Wales, Spain, &c. which ebb and flow daily with the flux and reflux of the ſea; and ſome are even ſaid to ebb and flow againſt the tide.— Add, 7°. *ſtalactical waters*. See STALACTITES.

Bath-WATER } See article { BATH.
Spaw-WATER. } See article { SPAW.
Petrifying-WATER. } See article { PETRIFYING.

Interdiction of Fire and WATER. See INTERDICTION.

WATER, in chymiſtry, by the chymiſts called more uſually *phlegm*; is the fourth of the five chymical principles, and one of the paſſive ones. See PRINCIPLE, and PHLEGM.

It is never drawn pure, and unmixed; which, Dr. Quincy obſerves, makes it uſually a little more deterſive than common *water*.

This principle, probably, contributes much to the growth of bodies, in that it both renders and keeps the active principles fluid; ſo that they are capable of being conveyed by circulation into the pores of the mix'd: and alſo becauſe it tempers their exorbitant motion, and keeps them together; ſo that they are not ſo eaſily and ſoon diſſipated.

In all ſuch bodies whoſe active ſubſtances are joined and united pretty cloſely together; as in common ſalt, tartar, all plants that are not odoriferous, and in many animal bodies, this principle is the firſt that comes in diſtillation: but when *water* is mixed with volatile ſalts, or with ſpirit of wine, or is in any odoriferous mixture; then the volatile particles will riſe and come away firſt. See PRINCIPLE, ELEMENT, &c.

WATERS, in medicine, pharmacy, chymiſtry, &c. called alſo *artificial*, and *medicated waters*; are a kind of liquors, produced or prepared by art from divers bodies, principally of the vegetable tribe; having various properties, and ſerving various purpoſes.

Theſe *waters* are either *ſimple*, or *compound*.

Simple WATERS, are thoſe procured from ſome one vegetable body. See VEGETABLE, PLANT, &c.

A *ſimple water* is not ſuppoſed to be the mere *water*, or phlegm of the body it is drawn from, as is evident from the taſte and ſmell thereof.— The intention of making ſuch *water*, is to draw out the virtues of the herb, ſeed, flower, root, or the like, ſo as it may be more conveniently given in that form, than any other. But the phlegm, or *watery* part of any medicinal ſimple, is no better than common *water* undiſtilled: ſo that all thoſe ingredients, which in diſtillation raiſe nothing but phlegm, as may be diſcovered from the ſcent and taſte of what comes over, are not fit for the ſtill.— On this principle, a great part of the *waters* retained in the diſpenſatories, will appear good for nothing, at leaſt not worth diſtilling.

The means whereby this ſeparation is effected, are either *evaporation*, *infuſion*, *decoction*, or *diſtillation*.— The firſt is performed by expoſing the vegetable in a cold ſtill, to a gentle heat, like that of a ſummer's ſun; and catching the effluvia which exhale from it. See HEAT, EVAPORATION, &c.

The effect of this operation, is a *water*, or fluid matter, which is the moſt volatile, fragrant, and aromatic part of the plant; and that wherein its ſpecific virtue reſides.— And thus is it, that the aromatic or odoriferous *waters* of vegetables are procured. See AROMATIC.

The ſecond means, *viz. infuſion*, is performed by putting the vegetable in hot rain-*water*, below the degree of boiling; keeping it to this degree by an equable heat, for the ſpace of half an hour; and then ſtraining or pouring it off. See INFUSION.— The only *waters* procured this way, in much uſe in the modern practice, are thoſe of frog-ſpawn, and oak-buds.

The third means, *viz. decoction*, only differs from the ſecond in this, that the *water* is kept to the degree of boiling. See DECOCTION.

The fourth means, *viz. diſtillation*, is performed by infuſing the ſubject in an alembic, with a gentle warmth, for ſome time; and, then increaſing the heat, ſo as to make it boil; and laſtly, catching and condenſing the ſteam, or vapour ariſing therefrom. See DISTILLATION.

This proceſs furniſhes what we call the *diſtilled waters*, of ſo much uſe in medicines, &c.— The vegetable ſubjects beſt fitted for it, are the ſapid and odorous, or thoſe of the aromatic tribe; as angelica, aniſeed, baum, carraway, coriander, cumin, dittany, fennel, hyſſop, marjoram, mint, roſes, roſemary, ſaffron, ſage, ſcurvygraſs, thyme, cinnamon, citron, juniper, lime, myrtle, orange, peach, &c.

The medicinal virtues of *waters* prepared after this manner, are

are the ſame as thoſe of the reſpective plants, *&c.* they are drawn from.— Thus, the diſtilled *water* of mint is ſtomachic; that of worm-wood, vermifugous, *&c.*

The materia medica, it may be obſerved, affords no remedies in this way, but for the intentions either of cordials, diuretics, or diaphoretics.— Were it practicable to raiſe a balſamic cathartic, or opiate in this way, yet would thoſe properties be much more conveniently brought forth by other proceſſes; ſo that nothing is to be looked for in a diſtilled *water*, but ſuch ſubtile and light parts of a medicinal ſimple, as may fall in with the forementioned intentions: indeed, very little comes over, under that diviſion, weighty enough to affect even the urinary ſecretions.

The *ſimple waters*, of chief virtue, are the following ones, *viz. Dill-water*, aqua anethi; *baum-water*, aqua meliſſæ; *angelica-water*, aqua angelicæ; *mint-water*, aqua menthæ; *roſemary-water*, aqua anthos; *orange-flower-water*, aqua naphæ; *black-cherry-water*, aqua ceraſor. nig. *parſly-water*, aqua petroſelini; *camomile*, chamom. *pennyroyal*, pulegii; *fennel-water*, aqua fæniculi; *damaſk-roſe-water*, aqua roſarum dam. *hyſſop-water*, aqua hyſſopi; *rue-water*, aqua rutæ; *juniper-water*, aqua juniperi bacc. *elder-water*, aqua ſambuci flor. *lovage-water*, aqua leviſtici; *carminative-water*, aqua carminativa, *&c.*

It may be here proper to note, that whatever properties any ſimple has from the groſſneſs or ſolidity of its parts, which make it act as an emetic, cathartic, or aſtringent; the reſidue left after diſtillation, will remain in full poſſeſſion thereof.— Thus, the purging ſyrup of roſes, is as well made after the damaſk-roſe-*water* is drawn off, as if the flowers were put into infuſion; becauſe nothing of a cathartic quality riſes with the *water*.

Sometimes, the ſubject is fermented, by the addition of yeſt, honey, or the like ferment, to the hot *water*, before the diſtillation begin: in which caſe, if the ferment added were in ſufficient quantity to effect a thorough fermentation, the liquid afterwards exhaled and drawn off, would be thin and inflammable; which makes what we call a *ſpirit*; otherwiſe, thick, white, ſapid, *&c.* and called a *water*. See FERMENTATION, SPIRIT, &c.

The *waters* procured in this manner, contain the oil of the plant in great perfection; which makes them of conſiderable uſe in medicine, further than thoſe raiſed without fermentation; beſide that they keep better and longer; the ſpirit in them preventing their corrupting or growing mothery.

Compound WATERS, or thoſe wherein ſeveral ingredients are uſed, are very numerous, and make a large article in commerce; ſome prepared by the apothecaries, according to the diſpenſatory preſcripts, for medicinal uſes; others by the diſtillers, to be drank by way of dram, *&c.* and others by the perfumers, *&c.*

They are diſtinguiſhed by different epithets, taken from the Latin, Greek, Arabic, Engliſh, *&c.* in reſpect either of the ſpecific virtues of the *waters*; or the parts of the body, for the cure whereof they are intended; or the diſeaſes they are good againſt; or the ingredients they are compounded of; or their different uſes, *&c.*

The moſt conſiderable among the claſs of *compound-waters*, we ſhall here enumerate.— The manner of making them, it is true, is not always the ſame; eſpecially thoſe intended for drinking; for which, every one gives his own method as the beſt.— Thoſe we here deliver, are taken from ſuch as have the greateſt reputation in preparing theſe things; or from thoſe who have wrote beſt of them.

We have only three general remarks to add, with regard to thoſe intended for drinking: 1°. That ſuch wherein any thing is infuſed, as bruiſed fruits, pounded herbs, or ground ſpices, are always paſſed through a ſtrainer, to make them finer and purer.— 2°. That thoſe made with brandy, or ſpirit of wine, are uſually diſtilled after mixing their ingredients; which renders thoſe liquors exceedingly ſtrong and dangerous, and confirms the proverb; *Plures occidit gula quam gladius.* In effect, ſome of them are ſo penetrating, that they burn the tongue when taken.— 3°. That the *waters* which take their name from any particular thing, as *cinnamon*, &c. have always ſome other ingredients joined with them, according to the taſte or ſmell required.

Alexipharmic, or *Alexiterial* WATERS, are *waters* that reſiſt poiſons and the plague.— Such are thoſe of angelica, ſcorzonera, citron, orange, ſcordium, rue, *&c.* See ALEXIPHARMIC.— Such alſo are *treacle-water*, *plague-water*, *milk-water*, *poppy-water*, &c.

Allum-WATER, is a vulnerary *water*, thus called, by reaſon the baſis, or principal ingredient thereof, is allum. See ALLUM, and VULNERARY.

Angelica-WATER, is uſually prepared of brandy, angelica-roots and ſeeds, carduus, baum, fennel-ſeed, *&c.* the whole beat together in a mortar; infuſed for a night in French brandy, and then diſtilled.— It is reputed a good carminative, and cordial; as alſo a cephalic, *&c.* See ANGELICA.

Aniſeed-WATER.— To eight parts of eſſence of aniſeed diſtilled, put three parts of brandy, with one of *water* boiled; mix the whole together: and if you require it ſugared, add half a pint of clarified ſugar; but many prefer it without: and ſtrain the whole.

Apricot-WATER.— To a quart of *water*, put ſix or eight apricots, ſliced; boil the whole, to extract the taſte; and when cold, add four or five ounces of ſugar.— When that is diſſolved ſtrain it.

Aromatic-WATERS, we have already ſpoke of among the ſimple *waters*.

Arthritic-WATERS, are *waters* good againſt the gout, palſy, tremors, pains in the joints, *&c.*— Such are thoſe of piony, chamæpitys, betony, roſemary, *&c.*

Bryony-WATER, is one of the *compound waters* preſcribed in the college diſpenſatory, prepared from bryony-roots, rue, mugwort, ſavin, feverfew, dittany, *&c.* It is a good hyſteric, opens menſtrual obſtructions, *&c.*

Carduus-WATER, is made from carduus benedictus pounded in a mortar, and put in an alembic.— Then, a ſufficient quantity of the juice of the ſame ſort of plant, drawn by expreſſion, is poured into the alembic, that the herbs ſwimming in the juice, may be in no danger of ſticking to the bottom of the cucurbit in diſtillation. Laſtly, fitting on a capital, and luting the joints, diſtil half as much juice as you put in.— This *water* is ſudorific, and good againſt the plague, malignant fevers, *&c.* See CARDUUS.

WATER *of ſeparation*, or *depart*, is only *aqua fortis*; thus called, becauſe ſerving to ſeparate gold from ſilver. See DEPART. It is alſo called

Cauſtic-WATER, and is prepared of a mixture of ſpirit of nitre and vitriol, drawn by force of fire; to which are ſometimes added allum, *&c.*

It diſſolves all metals, gold only excepted.— The invention of aqua fortis, is uſually referred to the thirteenth century: though ſome hold it to have been known in the time of Moſes. See AQUA *Fortis*, AURUM *Potabile*, &c.

Cephalic-WATERS, are *waters* proper to ſtrengthen and comfort the brain.— Such are thoſe of roſemary, marjoram, ſage, pyony, betony, baum, *&c.* See CEPHALIC.

Chalybeat-WATER, is a *water* wherein red-hot ſteel has been quenched.— It is aſtringent, and good, like ferruginous, or iron *waters*, for diarrhœas, *&c.* CHALYBEAT, and MARTIAL.

Cherry-WATER.— In a quart of *water* cruſh half a pound of cherries, with four or five ounces of ſugar. Strain the whole through a cloth, till it be very clear.

Cinnamon-WATER.— In a quart of *water* boil half an ounce of broken cinnamon; and taking it off the fire, add a quarter of a pound of ſugar: let it cool, and ſtrain it.— Or thus: take a pound of cinnamon, three pounds of *roſe-water*, and as much white-wine: bruiſe the cinnamon, infuſe it fourteen days, then diſtil it.— The firſt *water* that riſes is the beſt; then the ſecond; then the third. See CINNAMON.

Clary-WATER, is compoſed of brandy, ſugar, and cinnamon, with a little ambergreaſe diſſolved in it.— It helps digeſtion, and is cardiac.— This *water* is rendered either purgative or emetic, by adding reſins of jallop and ſcammony, or crocus metallorum.— Some make *clary-water* of brandy, juice of cherries, ſtrawberries and gooſeberries, ſugar, cloves, white pepper, and coriander-ſeeds, infuſed, ſugared, and ſtrained.

Clove-WATER, is prepared of brandy, and cloves bruiſed therein, and diſtilled. See CLOVE.

Cordial, or *Cardiac* WATERS, are *waters* proper to ſtrengthen and comfort the heart.— Such are thoſe of endive, chicory, bugloſs, burrage, marigolds, *&c.* See CARDIAC, and CORDIAL.

Coſmetic-WATERS, are *waters* proper to cleanſe, ſmoothen, and beautify the ſkin. See COSMETIC.

Fennel-WATER.— Infuſe a handful of fennel in a pint of cold *water*, for an hour, or an hour and a half: add three or four ounces of Sugar. Strain it, and drink it.

Gentian-WATER.— Take four pounds of gentian roots, either green, or dried; mince them ſmall, infuſe them in white-wine, or only ſprinkle them therewith; then diſtil them, with the addition of a little centaury the leſſer. See GENTIAN.

It is frequently uſed as a ſtomachic, and is alſo commended for a deterger; ſerving in dropſies, jaundice, obſtructions of the viſcera, *&c.*

Gum-WATER, is that made by letting gum-arabic, incloſed in a linen rag, infuſe in common *water*.— The ladies alſo make *water* to gum their hair, of quince-kernels ſteeped in *water*. See GUM, and ARABIC.

Hepatic-WATERS, are thoſe uſed to cleanſe, ſtrengthen, and refreſh the liver.— Such are thoſe of chicory, capillaries, purſlain, agrimony, fumitory, *&c.*

Honey-WATER, is a *water* prepared in places where much honey is made, by waſhing out the honey-combs, and the veſſels they have been in, in common *water*.— This gives it a honey-taſte, and it afterwards becomes very clear, and the people uſe it as their common drink. See HONEY.

Horſe-raddiſh WATER, *aqua raphani*, is prepared of the juices of ſcurvygraſs, brook-lime, water-creſſes, white-wine, lemon-juice, bryony-root, horſe-raddiſh, winter's-bark and nutmeg, digeſted and diſtilled.— It is a good diuretic; cleanſing, and removing obſtructions of the viſcera, promoting perſpiration, *&c.*

Hungary-WATER, is a liquor diſtilled in balneo mariæ, from roſemary-flowers, and ſpirit of wine well rectified.— It has its name from the wonderful effects it is ſaid to have had on a queen of Hungary, at the age of 72 years.— It is good againſt faintings, palſies, lethargies, apoplexies, and hyſterical diſorders.— There are divers ways of preparing it. See HUNGARY.

Hyſteric-WATERS, are thoſe proper to ſtrengthen the matrix, or womb, and remedy the diſorders that befal it.— Such are thoſe of bryony, matricary or motherwort, hyſſop, fennel, baum, mugwort, ſmallage, *&c.* See HYSTERIC.

Iced, or *Frozen* WATERS, are certain agreeable and wholeſom *waters*, as *orange-water*, or the like, artificially froze in ſummer-time, particularly in hot Countries, to be uſed in collations, *&c.* as coolers.— The way of making them is thus: the veſſels containing the liquors deſigned to be froze, are firſt ſet in a pail, in ſuch manner, as not to touch each other; then covered up, and the void ſpace in the pail filled with common ice, beaten, and mixed with ſalt.— Every half hour they clear out what *water* the thawing ice ſends to the bottom of the pail, by means of a hole at bottom; and at the ſame time ſtir up the liquors with a ſpoon, that they may freeze into ſnow: for were they to ſhoot in form of ice, or icicles, they would have no taſte.— Then, covering the veſſels again, they fill up the pail with more beaten ice, and ſalt, in lieu of that diſſolved and evacuated. The more expeditious the freezing is required to be, the more ſalt is to be mixed with the ice. See FREEZING.

Imperial-WATER, *Aqua imperialis*, is a *water* diſtilled from cinnamon, nutmeg, citron-bark, cloves, calamus aromaticus, ſantal, and divers other ſimples, infuſed in white-wine and *baum-water*.— It is a pleaſant cordial-dram, good againſt diſeaſes of the brain, ſtomach, and womb.

Juniper-WATER, is a compound *water*, made of brandy, and juniper-berries beaten therein, and diſtilled. See JUNIPER, and GENEVA.

Lime-WATER, is common *water*, wherein quick-lime has been ſlaked; and afterwards filtered. See LIME.

Milk-WATER, *Aqua lactis*, is prepared of mint, wormwood, carduus benedictus, goat's-rue, and meadow-ſweet, bruiſed, infuſed in milk, and drawn off by infuſion.— It is held alexipharmic, and cephalic.

Aqua Mirabilis, or *the wonderful* WATER, is prepared of cloves, galangals, cubebs, mace, cardomums, nutmeg, ginger, and ſpirit of wine, digeſted twenty-four hours, then diſtilled.— It is a good and agreeable cordial, carminative, *&c.*

Nephritic-WATERS, are ſuch as ſtrengthen the reins, and help them to diſcharge, by urine, any impurities therein.— Such are thoſe of the honeyſuckle, pellitory, raddiſh, beans, mallows, *&c.* See NEPHRITIC.

The *nephritic-water* of Dr. Radcliff, popularly called *Dr. Radcliff's water*, is taken into the laſt edition of the college diſpenſatory.— It is prepared from the kernels of black cherries, peaches, and bitter almonds, beaten in a mortar into a paſte, with rheniſh wine; and ſeeds of ſmallage, treacle, muſtard, gromwel, and parſly, beaten likewiſe, and added thereto: to the mixture are put juniper-berries, garlic, onions, leeks, pimpernel, horſe-raddiſh, calamus aromaticus, cinnamon, wall-rue, mace, and nutmegs: the whole macerated in rheniſh, ſpirit of black cherries, *&c.* and thus diſtilled.— It is one of the moſt powerful detergers and cleanſers known; good in the dropſy, jaundice, aſthma, pleuriſy, *&c.*

Ophthalmic, or *Eye*-WATERS, are ſuch as are good in diſorders of the eyes.— ſuch are thoſe of eye-bright, fennel, vervain, plantain, celandine, cyanus, *&c.* See OPHTHALMIC.

Orange-flower WATER, is made of common *water*, ſugar, and orange-flowers, infuſed for about two hours.— After the like manner, one may make *waters* of divers other flowers; as violets, jonquils, jeſſamies, tuberoſes, *&c.*

Peach-WATER, is made after the ſame manner as *apricot-water*; only with peaches.

Phagedænic-WATER, is *lime-water*, to every pound whereof, is added twenty or thirty grains of corroſive ſublimate, in powder.— It ſerves to cleanſe old ulcers, to eat off fungous fleſh, *&c.* See PHAGEDÆNIC.

Plague-WATER, *Aqua epidemica*, is prepared from the roots of maſterwort, angelica, pyony, and butter-bur; vipergraſs, Virginia ſnake-root, rue, roſemary, baum, carduus, water-germander, marigold, dragon, goat's rue, and mint; the whole infuſed in ſpirit of wine, and diſtilled. See PLAGUE. — It is of frequent uſe, as an alexipharmic: it revives the ſpirits, and promotes a diaphoreſis. It is the baſis of moſt juleps now preſcribed, eſpecially in feveriſh caſes.

Poppy-WATER, is prepared from the flowers of wild poppies, infuſed in white-wine, or brandy, and drawn off in a cold ſtill.— It is a cordial, good againſt the colic, and by ſome called *red plague-water*.

Pyony-WATER, is made of pyony and lime-flowers, and lilly of the valley ſteeped in canary, and diſtilled: to the *water* thus procured, are added the root of male pyony, white dittany, birthwort, miſletoe, rue, caſtor, cubebs, cinnamon, betony, *&c.*— It is a good cordial, and much uſed in nervous caſes.

Roſe-WATER.— Take of roſes three parts, and of fennel and rue each, one part; chop them ſmall, and mix them well together; then diſtil them. See ROSE.— This *water* is excellent for the eyes, *&c.*

Scordium-WATER, is prepared from the juices of goats-rue, ſorrel, ſcordium, citrons, and venice treacle, digeſted and diſtilled.— It is an alexipharmic.

Second-WATER. See the article SECUNDA *Aqua*.

Specific-WATERS, are ſuch as have ſome peculiar virtue, appropriate to certain diſeaſes. Thus *purſlain-water*, wherein mercury has been infuſed, is a ſpecific againſt worms in young children. See SPECIFIC.

Splenetic-WATERS, are thoſe proper againſt diſeaſes of the ſpleen. Such are thoſe of the tamariſk, cuſcuta, hartſtongue, hops, *&c.* See SPLEEN.

Stephens's-WATER, *Aqua Stephani*, is made from cinnamon, ginger, galangals, cloves, nutmegs, paradiſe-grains, aniſſeeds, ſweet-fennel, carraway, thyme, mint, ſage, pennyroyal, pellitory, roſemary, red roſes, camomile, origany, and lavender, ſteeped in french brandy, or ſpirit of wine, and diſtilled.— It is a good cephalic and cardiac, and is alſo reputed hyſterical.

Stomachic-WATERS, are ſuch as have the virtue to cleanſe, ſtrengthen, and confirm the ſtomach.— As red *roſe-water*, *mint-water*, *aniſeed-water*, &c. See STOMACHIC.

Stygian-WATER. See the article AQUA *Regalis*.

Styptic-WATER, is a diſſolution of rubified vitriol, or the colcothar remaining in the retort, after the ſpirit has been extracted; with burnt allum and ſugar-candy.— With thirty grains of each of theſe three Drugs, ſome mix half an ounce of urine of a young man, as much *roſe-water*, and two ounces of *plantain-water*.— Its uſe is to ſtop bleeding. See STYPTIC.

Surfeit-WATER. See the article SURFEIT.

Treacle-WATER, *Aqua Theriacalis*, is directed by the college diſpenſatory to be made of green walnuts, rue, carduus, marigold, baum, butter-bur-roots, burdock, angelica, maſterwort, water-germander, Venice-treacle, mithridate, canary-vinegar, and lemon-juice, ſteeped and diſtilled.— It is the moſt uſed of any in the ſhops; though Dr. Quincy decries it as one of the worſt concerted of all.— Its intention is to be an alexipharmic, and ſudorific.

Other diſpenſatories give a more ſimple *treacle-water*, made from venice treacle, with an equal quantity of brandy and vinegar.— It is good for ulcers, and eroſions of the mouth; eſpecially if a little Armenian bole be diſſolved therein. See THERIACA.

Vulnerary-WATER, is a *water* proper for the healing of wounds, prepared from the juice of vulnerary plants. See VULNERARY.

WATER, in anatomy, *&c.* is applied to divers liquors, or humours in the human body. See HUMOUR, FLUIDS, *&c.*

Such is the aqua phlegmatica, *phlegmatic-water*; which is a ſoft ſerous humour contained in the pericardium, and wherein the heart ſwims. See PERICARDIUM.

Anatomiſts are divided about it: ſome will not have it natural, but ſuppoſe it ſeparated forcibly during the pangs of death: their reaſon is, the difficulty they meet withal in tracing its paſſage, or how it is carried off.— The lateſt anatomiſts, however, ſeem to agree to its being a natural and neceſſary humour: and one reaſon is, that it is found even in the pericardiums of fœtus's.

It has likewiſe been diſputed whence it ſhould be ſeparated. —The freſheſt opinion is, that it is ſecreted by ſome glands about the baſis of the heart; and that it diſtils thence, drop by drop, into the cavity of the pericardium, in ſuch quantity, as juſt to ſupply what is expended daily by the motion and warmth of the heart; and ſo needs no evacuation.— Its uſe is to moiſten, lubricate, and cool the heart, and prevent any inflammation that might ariſe from the dry friction of the heart and pericardium.— So that it does the ſame office to the heart, that the *water* does wherein the fœtus ſwims; which, without it, would not have liberty to move at all. See HEART.

WATER is alſo uſed in divers ceremonies, both civil and religious.— Such is the *baptiſmal water*, *holy water*, &c. See BAPTISM, &c.

Holy WATER, is a *water* prepared every Sunday in the Romiſh church, with divers prayers, exorciſms, *&c.* uſed by the people to croſs themſelves withal at their entrance, and going out of church; and pretended to have the virtue of waſhing away venial ſins, driving away devils, preſerving from thunder, diſſolving charms, ſecuring from, or curing diſeaſes, *&c.*

The uſe of *holy water* appears to be of a pretty antient ſtanding

ing in the church: witneſs S. Jerom, in his life of S. Hilarion, and Gretſer *de Benedict.* cap. x, &c.— M. Godeau attributes its original to pope Alexander, a martyr under the emperor Adrian.

Many of the reformed take the uſe of *holy water* to have been borrowed from the *luſtral water* of the antient Romans. See LUSTRAL.— Though it might as well be taken from the ſprinklings in uſe among the Jews. See *Numbers* xix. 17.

Urban Godfrey Siber, a German, has a diſſertation printed at Leipſic, to ſhew, by proofs brought from church-hiſtory, that one may give *holy water* to drink, to brutes.

Bitter WATERS *of Jealouſy.*— In the Levitical law, we find mention made of a *water*, which ſerved to prove whether or no a woman were an adultreſs.— The formula was this: the prieſt, offering her the holy *water*, denounced,— " If thou haſt gone aſide to another, inſtead of thy huſband, and if thou be defiled, &c. the Lord make thee a curſe and an oath among thy people, by making thy thigh to rot, and thy belly to ſwell: and this *water* ſhall go into thy bowels, to make thy belly to ſwell, and thy thigh to rot." And the woman ſhall ſay, *Amen.*— " Theſe curſes the prieſt ſhall write in a book, and blot them out with the *bitter water.*— " When he hath made her drink the *bitter-water*, it ſhall come to paſs, that, if ſhe be defiled, the *water* ſhall enter into her, and become bitter, and her belly ſhall ſwell, &c."— " If ſhe be not defiled, ſhe ſhall be free, and conceive ſeed." *Numbers*, ch. v.

WATER *Ordeal*, or *Trial*, was of two kinds; by hot, and by cold *water*. See ORDEAL, &c.

Trial or Purgation by boiling, or hot WATER.— Among our anceſtors, there was a way of proving crimes, by immerging the body, or the arm in hot *water*, with divers religious ceremonies. See PURGATION, &c.

In the judgment by *boiling water*, the accuſed, or he who perſonated the accuſed, was obliged to put his naked arm into a cauldron full of *boiling water*, and to draw out a ſtone thence, placed at a greater or leſs depth, according to the quality of the crime— This done, the arm was wrapped up, and the judge ſet his ſeal on the cloth; and at the end of three days they returned to view it; when, if it were found without any ſcald, the accuſed was declared innocent.

The nobles and great perſons purged themſelves thus by *hot water*; and the populace by *cold water*.

F. Mabillon will have this ceremony to have been introduced by pope Eugenius II. in lieu of making oath with the hand laid on the relicks of ſome ſaint; which, having been abuſed, was prohibited by Innocent III. at the council of Lateran.

" Theotberge, wife of Lothaire of France, having been accuſed of inceſt, committed before marriage with her brother duke Hubert; as ſhe could not be convicted by any witneſſes, certain of the biſhops were conſulted as to the manner wherein the judges ſhould proceed, in an affair where the crime, though very dubious, did diſhonour to the king.— The biſhops were of opinion, they ſhould have recourſe to the proof by *boiling water*; which conſiſted in this: that the accuſed, to prove her innocence, ſhould plunge her hand into a baſon of *boiling water*, and take out a ring put therein.— Sometimes, indeed, they ſubſtituted another perſon to make the trial, in the room of the accuſed: accordingly, the rank and quality of Theotberge excuſing her from making the proof herſelf, ſhe choſe a man to do it for her; who, either out of zeal for the life and honour of the princeſs, or for money, ſtood the teſt, and drew out his hand and the ring, without harm." *F. Daniel's Hiſt. of France.*

Trial or Purgation by cold WATER.— After certain prayers, and other ceremonies, the accuſed was ſwaddled, or tied up all in a pelotoon, or lump; and thus caſt into a river, lake, or veſſel of *cold water*; where, if he ſunk, he was held criminal; if he floated, innocent. See JUDICIUM, PURGATION, PROOF, DUEL, &c.

WATER, among jewelers, is properly the colour or luſtre of diamonds, and pearls; thus called, by reaſon theſe were antiently ſuppoſed to be formed, or concreted of *water*. See GEM, &c.

Thus, they ſay, ſuch a pearl is of a fine *water*. See PEARL.

The *water* of ſuch a diamond is muddy. See DIAMOND.

The term is ſometimes alſo uſed, though leſs properly, for the colour or hue of other precious ſtones. See PRECIOUS *Stone*, GEM, &c.

WATER-*Bailiff*, is an officer anciently eſtabliſhed in all port-towns, for the ſearching of ſhips; as appears from 28 Hen. VI. cap. v.

There is ſuch an officer ſtill on foot in the city of London, who ſuperviſes and ſearches all fiſh brought thither; and gathers the toll ariſing from the river of Thames.— He attends alſo on the lord-mayor in his expeditions by *water*, and hath the principal care of marſhalling the gueſts at the table.— He alſo arreſts men for debt, or other perſonal or criminal matters on the river of Thames, by warrant of his ſuperiors, &c.

WATER-*Born*, in the ſea language.— A ſhip is ſaid to be *water-born*, when ſhe is where there is no more *water* than will barely bear her from ground; or when lying even with the ground, ſhe firſt begins to float, or ſwim.

WATER-*Camblets*. See the article CAMBLET.

WATER-*Colours*, in painting, are ſuch colours as are only diluted and mixed up with *gum-water*.— In contradiſtinction to *oil-colours*. See COLOUR.

The uſe of *water-colours*, makes what we call *limning*; as that of oil-colours does *painting*, properly ſo called. See LIMNING, and PAINTING.

Cut-WATER. See the article CUT-*Water*.

Dead-WATER, in the ſea language, is the *eddy water* that follows the ſtern of the ſhip, not paſſing away ſo faſt as that which ſlides by her ſides. See DEAD.

WATER-*Farcin*. See the article FARCIN.

WATER-*Gage*, an inſtrument to meaſure the depth, or quantity of any *water*.

WATER-*Gang*, a channel cut to drain a place, by carrying off a ſtream of *water*. See CANAL, TRENCH, &c.

WATER-*Gilding*. See the article GILDING.

WATER-*Line*, of a ſhip, is a line which diſtinguiſhes that part of her under *water*, from that above, when ſhe is duly laden.

WATER-*Meaſure*.— Salt, ſea-coal, &c. while aboard veſſels in the pool, or river, are meaſured with the corn-buſhel heaped up; or elſe five ſtriked pecks are allowed to the buſhel.— This is called *water-meaſure*; and exceeds Wincheſter-meaſure by about three gallons in the buſhel. See MEASURE, CHALDRON, &c.

WATER-*Poiſe*. See the article HYDROMETER.

Dr. Hooke has contrived a *water-poiſe*, which may be of good ſervice in examining the purity, &c. of *water*.— It conſiſts of a round glaſs ball, like a bolt-head, about three inches in diameter, with a narrow ſtem or neck, $\frac{1}{24}$ of an inch diameter; which being poiſed with red lead, ſo as to make it but little heavier than pure ſweet *water*, and thus fitted to one end of a fine balance, with a counterpoiſe at the other; upon the leaſt addition, of even $\frac{1}{2000}$th part of ſalt to a quantity of *water*, half a inch of the neck will emerge above the *water*, more than did before. *Philoſophical Tranſact.* N°. 197.

WATER-*Rocket*. See the article ROCKET.

WATER-*Scape*, of the Saxon *waterſchap*, denotes an aquæduct, drain, or paſſage for *water*. See AQUÆDUCT.

WATER-*Shoot*, a young ſprig, which ſprings out of the root or ſtock of a tree. See SUCKERS, STOCK, &c.

WATER-*Shot*, in the ſea language, a ſort of riding at anchor, when a ſhip is moored neither croſs the tide, nor right up and down; but quartering betwixt both.

WATER-*Table*, in architecture, is a ſort of ledge, left in ſtone or brick walls, about 18 or 20 inches from the ground: from which place, the thickneſs of the wall begins to abate. See WALL.

WATER-*Way*, in a ſhip, is a ſmall ledge of timber, lying fore and aft on the deck, cloſe by her ſides; to keep the *water* from running down there.

WATER-*Wheel*, an engine for raiſing *water* in great quantity out of a deep well. See PERSIAN *Wheel*.

WATERING, in gardening, &c. the application of *water* to the ſoil of plants, &c. when not ſufficiently moiſtened with rain, dew, &c. See SOIL, VEGETATION, &c.

After ſowing ſeed of any kind, though the ground be ever ſo dry, they ſhould never be *watered* till they have been forty-eight hours in the ground, and the ground is a little ſettled about them; otherwiſe, a too great glut of nouriſhment at firſt will be apt to burſt them. See SEED, and SEMINATION.

Care is to be taken, that the leaves of young and tender plants be not *watered* at all while the weather is cold; only the ground to be wet about them.— For hardy plants and ſeeds, if the nights be cold, *water* in the forenoon; otherwiſe, in the evening.

Water that comes out of deep pits, or wells, ſhould ſtand a day in an open veſſel, ere it be applied to tender plants in the ſpring.— Dung of ſheep, pidgeons, or hens, or aſhes, lime, &c. infuſed in the water, will forward the growth of plants. See MANURING.

WATERING, in the manufactures.— *To* WATER *a Stuff*, is to give it a luſtre, by wetting it lightly, and then paſſing it through the preſs, or the calender, whether hot or cold. See CALENDER, TABBY, PRESSING, &c.

WATERY *Humour*. See the articles AQUEOUS, and HUMOUR.

WATTLES, among huſbandmen, grates or hurdles, for folds for ſheep. See HURDLES, PARK, &c.

The word is alſo uſed for the gills of a cock— and for the naked red fleſh that hangs under a turkey's neck.

WAVE, *Unda*, in phyſics, a cavity in the ſurface of water, or other fluid, with an elevation aſide thereof. See FLUID, and WATER.

The origin of *waves* may be thus conceived.— The ſurface of a ſtanding water being naturally plain, and parallel to the horizon; if by any means it be rendered hollow, as at A, (*Tab. Hydroſtatics. fig.* 30.) its cavity will be ſurrounded with an elevation B B; this raiſed water will deſcend by its gravity, and with the celerity acquired in deſcending, form a new cavity; by which motions, the water will aſcend at the ſides of this cavity, and fill the cavity A, while there is a new elevation towards C; and when this laſt is depreſſed, the water riſes a-new towards the ſame part.— Thus ariſes a ſucceſſive motion in the ſurface of the water; and a cavity, which carries an elevation before it, is moved along from A towards C.— This cavity, with the elevation next it, is called a *wave*; and the ſpace taken up by the *wave* on the ſurface of the water, and meaſured according to the direction of the *wave*'s motion, is called the *breadth of the wave.* See RIVER, and UNDULATION.

The Motion of WAVES makes an article in the new philoſophy; and the laws thereof being now pretty well determined, we ſhall give the reader the ſubſtance of what is taught thereon.

1°. Then, the cavity, as A, is incompaſſed every way with an elevation; and the motion above-mentioned expands itſelf every way: therefore the *waves* are moved circularly.

2°. Suppoſe, now, A B, (*fig.* 31.) an obſtacle, againſt which the *wave*, whoſe beginning is at C, ſtrikes; and we are to examine what change the *wave* ſuffers in any point, as E, when it is come to the obſtacle in that point.— In all places through which the *wave* paſſes in its whole breadth, the *wave* is raiſed; then a cavity is formed, which is again filled up; which change while the ſurface of the water undergoes, its particles go and return through a ſmall ſpace: the direction of this motion is along C E, and the celerity may be repreſented by that line.— Let this motion be contrived to be reſolved into two other motions, along G E and D E, whoſe celerities are reſpectively repreſented by thoſe lines.— By the motion along D E, the particles do not act againſt the obſtacle; but after the ſtroke, continue their motion in that direction with the ſame celerity; and this motion is here repreſented by E F, ſuppoſing E F and E D to be equal to one another: but by the motion along G E, the particles ſtrike directly againſt the obſtacle, and this motion is deſtroyed; for though the particles are elaſtic, yet, as in the motion of the *waves* they run through but a ſmall ſpace, going backward and forward, they proceed ſo ſlowly, that the figure of the particles cannot be changed by the blow; and ſo are ſubject to the laws of percuſſion of bodies perfectly hard. See PERCUSSION.

But there is a reflection of the particles from another cauſe: the water which cannot go forward beyond the obſtacle, and is puſhed on by that which follows it, gives way where there is the leaſt reſiſtance; that is, aſcends: and this elevation, which is greater in ſome than other places, is cauſed by the motion along G E; becauſe it is by that motion alone that the particles impinge againſt the obſtacle.— The water, by its deſcent, acquires the ſame velocity with which it was raiſed; and the particles of water are repelled from the obſtacle, with the ſame force in the direction E G, as that with which they ſtruck againſt the obſtacle.— From this motion, and the motion above-mentioned along E F, ariſes a motion above E H, whoſe celerity is expreſſed by the line E H, which is equal to the line C E: and by the reflection, the celerity of the *wave* is not changed; but it returns along E H, in the ſame manner, as if, taking away the obſtacle, it had moved along E *h*.

If from the point C, C D be drawn perpendicular to the obſtacle, and then produced, ſo that D *c* ſhall be equal to C D, the line H E continued will go thorough *c*: and as this demonſtration holds good in all points of the obſtacle, it follows, that the reflected *wave* has the ſame figure on that ſide of the obſtacle, as it would have had beyond the line A B, if it had not ſtruck againſt the obſtacle.— If the obſtacle be inclined to the horizon, the water riſes and deſcends upon it, and ſuffers a friction, whereby the reflection of the *wave* is diſturbed, and often wholly deſtroyed: and this is the reaſon why very often the banks of rivers do not reflect the *waves*.

If there be a hole, as I, in the obſtacle B L, the part of the *wave* which goes through the hole continues its motion directly, and expands itſelf towards Q Q; and there is a new *wave* formed, which moves in a ſemicircle, whoſe centre is the hole. For the raiſed part of the *wave*, which firſt goes through the hole, immediately flows down a little at the ſides; and by deſcending, makes a cavity, which is ſurrounded with an elevation on every part beyond the hole, which moves every way in the ſame manner as was laid down in the generation of the firſt *wave*.

In the ſame manner, a *wave* to which an obſtacle, as A O, is oppoſed, continues to move between O and N; but expands itſelf towards R, in a part of a circle, whoſe centre is not very far from O— Hence, we may eaſily deduce what muſt be the motion of a *wave* behind an obſtacle, as M N.

Waves are often produced by the motion of a tremulous body, which alſo expand themſelves circularly, though the body goes and returns in a right line; for the water which is raiſed by the agitation, deſcending, forms a cavity, which is every where ſurrounded with a riſing.

Different *waves* do not diſturb one another, when they move according to different directions.— The reaſon is, that whatever figure the ſurface of the water has acquired by the motion of the *waves*, there may in that be an elevation and depreſſion; as alſo ſuch a motion as is required in the motion of a *wave*.

To determine the celerity of the *waves*, another motion, analogous to theirs, muſt be examined.— Suppoſe a fluid in the bent cylindric tube E H, (*fig.* 32.) and let the fluid in the leg E F, be higher than in the other leg by the diſtance *l* E; which difference is to be divided into two equal parts at *i*.— The fluid, by its gravity, deſcends in the leg E F, while it aſcends equally in the leg E H: ſo that when the ſurface of the fluid is arrived at *i*, it is at the ſame heighth in both legs; which is the only poſition wherein the liquid can be at reſt: but by the celerity acquired in deſcending, it continues its motion, and aſcends higher in the tube G H; and in E F is depreſſed quite to *l*. except ſo much as it is hindered by the friction againſt the ſides of the tube.— The fluid in the tube G H, which is higher, alſo deſcends by its gravity, and ſo the fluid in the tube riſes and falls, till it has loſt all its motion by the friction.

The quantity of matter to be moved, is the whole fluid in the tube; the moving force, is the weight of the column *l* E, whoſe heighth is always double the diſtance E *i*; which diſtance, therefore, increaſes and diminiſhes in the ſame ratio with the moving force.— But the diſtance E *i*, is the ſpace to be run through by the fluid, in order to its moving from the poſition E H, to the poſition of reſt; which ſpace, therefore, is always as the force continually acting upon the fluid: but it is demonſtrated, that it is on this account that all the vibrations of a pendulum, oſcillating in a cycloid, are iſochronal; and therefore, here alſo, whatever be the inequality of the agitations, the fluid always goes and returns in the ſame time.— The time in which a fluid thus agitated aſcends, or deſcends, is the time in which a pendulum vibrates, whoſe length is equal to half the length of the fluid in the tube, or to half the ſum of the lines E F, F G, G H. This length is to be meaſured in the axis of the tube. See PENDULUM.

From theſe principles, to determine the celerity of the *waves*, we muſt conſider ſeveral equal *waves* following one another immediately; as A, B, C, D, E, F, (*fig.* 33.) which move from A towards F: the *wave* A has run its breadth, when the cavity A is come to C; which cannot be, unleſs the water at C aſcends to the heighth of the top of the *wave*, and again deſcends to the depth C; in which motion, the water is not agitated ſenſibly below the line *h i*: therefore, this motion agrees with the motion in the tube abovementioned; and the water aſcends and deſcends, that is, the *wave* goes through its breath, while a pendulum of the length of half B C performs two oſcillations, or while a pendulum of the length B C D, that is, four times as long as the firſt, performs one vibration. Therefore, the celerity of the *wave* depends upon the length of the line B C D; which is greater, as the breadth of the *wave* is greater, and as the water deſcends deeper in the motion of the *waves*.— In the broadeſt *waves*, which do not riſe high, ſuch a line as B C D, does not much differ from the breadth of the *wave*; and in that caſe, a *wave* moves its breadth, while a pendulum, equal to that *wave*, oſcillates once. See OSCILLATION.

In every equable motion, the ſpace gone through increaſes with the time and the celerity; wherefore, multiplying the time by the celerity, you have the ſpace gone through: whence it follows, that the celerities of the *waves*, are as the ſquare roots of their breadths: for as the times in which they go through their breadths are in that ratio, the ſame ratio is required in their celerities, that the products of the times, by their celerities, may be as the breadths of the *waves*, which are the ſpaces gone through.

WAVE *Camblets*. See the article CAMBLET.

WAVED, or WAVY, a term in heraldry, when a bordure, or any ordinary or charge in a coat of arms, has its outlines indented, in manner of the riſing and falling of *waves*. — This is alſo called *undy*, *undé*, or *ondé*.

To **WAVE**, is uſed in the ſea language, for the making ſigns for a veſſel to come near, or keep off. See SIGNAL.

WAVESON, in the admiralty law, a term uſed for ſuch goods, as, after ſhipwreck, appear ſwimming on the waves. See FLOTSON, &c.

WAVY. See the article WAVED.

WAX, *Cera*, a ſoft yellowiſh matter, whereof the bees form cells to receive their honey. See HONEY-COMB, CELLS, &c.

Wax is not the excrement of this laborious inſect, as the antients, and after them many of the moderns, have imagined. — It is properly a juice, exuding out of the leaves of plants, and adhering to the ſurface thereof; from which it is ſcraped off by the bees, with their rough thighs, to build their combs withal.— It is chiefly afforded by lavender and roſemary; from which laſt, any body may gather *wax*; and, with the aſſiſtance of the microſcope, the *wax* may be plainly ſeen ſticking on the leaves of the plant.— So that *wax* is not an animal, but a vegetable ſubſtance.

Naturaliſts have generally imagined *wax* to be gathered from the flower, ſome from the petala, and others from the apices; but Boerhaave affirms it a juice peculiar to the leaves, and not afforded by the flowers, which only yield honey. See HONEY.

The honey is formed of a liquid matter, ſucked into the body; and only ſeems to arrive at its perfection, in the entrails of the little animal: whereas the *wax*, being a hard ſubſtance, is gathered only with the fore legs and chaps; conveyed thence to the middle legs, and thence to the middle joint of the hind legs, where there is a ſmall cavity, like the bowl of a ſpoon, to receive it; and where it is collected into heaps, of a ſhape and ſize of lentils.

The bee arrived at the hive with its load of *wax*, finds ſome difficulty in unburdening himſelf of ſo tenacious a matter.— Frequently, being unable to lay it down himſelf, he calls for aſſiſtance, by a particular motion of the legs and wings; upon which, a number of his companions ſtreight run to his ſuccour, and each with his jaws takes off a ſmall quantity of the *wax*; others ſucceeding; till their laden fellow be quite diſburdened. See HONEY.

Wax makes a very conſiderable article in commerce; the conſumption thereof, throughout the ſeveral parts of Europe, being incredible.— There are two kinds, *white*, and *yellow*; the yellow is the native *wax*, juſt as it comes out of the hive, after expreſſing the honey, *&c.* the white is the ſame *wax*, only purified, waſhed, and expoſed to the air. The preparation of each follows.

Yellow WAX.—To procure the *wax* from the combs for uſe; after ſeparating the honey from them, in the manner deſcribed under the article HONEY; they put all the matter remaining in a large kettle, with a ſufficient quantity of water; where, with a moderate fire, they melt it, and then ſtrain it through a linen cloth, by a preſs: ere cold, they ſcum it with a tyle, or a piece of wet wood, and caſt it, while yet warm, in wooden, earthen, or metalline moulds; having firſt anointed them with honey, oil, or water, to prevent the *wax* from ſticking.—Some, to purify it, make uſe of Roman vitriol, or copperas; but the true ſecret is to melt, ſcum it, *&c.* properly, without any ingredients at all.

The beſt is that of a high colour, an agreeable ſmell, brittle, and that does not ſtick to the teeth when chewed. It is often ſophiſticated with roſin, or pitch coloured with rocou, or turmeric.

By chymiſtry, *wax* yields a white thick oil, reſembling butter; whence the chymiſts call it *butter of wax.*— From this oil is drawn a ſecond, as clear as water; both the one and the other are excellent for chilblains.— The fæces remaining in the bag, after expreſſing the *wax*, is uſed both by ſurgeons and farriers, with ſucceſs, againſt ſtrains.

White WAX.— The whitening or blanching of *wax*, is performed by reducing the yellow ſort, firſt, into little bits or grains, by melting it, and throwing it, while hot, into cold water, or elſe by ſpreading it into very thin leaves, or ſkins. See WHITE.

This *wax*, thus granulated, or flatted, is expoſed to the air on linen cloths; where it reſts night and day, having equally need of ſun and dew.— Then they melt and granulate it over again ſeveral times; ſtill laying it out to the air, in the intervals, between the meltings.

When the ſun and dew have at length perfectly blanched it, they melt it, for the laſt time, in a large kettle; out of which they caſt it, with a ladle, upon a table, covered over with little round dents or cavities, of a form of the cakes of *white wax* ſold by the apothecaries, *&c.* having firſt wet thoſe moulds with cold water, that the *wax* may be the eaſier got out.— Laſtly, they lay out theſe cakes to the air for two days and two nights, to render it more tranſparent, and drier.

This *wax* is uſed in the making of torches, tapers, flambeaux, figures, and other *wax*-works. See TAPER, FLAMBEAU, &c.

It is alſo an ingredient in plaiſters, cerats, and divers pomatums, and unguents, for the complexion. See CERATE, &c.

Yellow *wax* is made ſoft with turpentine, yet retains its natural colour.— Red *wax*, is only the white melted with turpentine, and reddened with vermilion or orcanette.— Verdegreaſe makes it green; and burnt paper, or lampblack, black.— Some travellers tell us of a natural black *wax*; aſſuring us there are bees, both in the Eaſt and Weſt-Indies, that make an excellent honey, included in black cells.— Of this *wax* it is, that the Indians make thoſe little vaſes, wherein they gather their balſam of Tolu.

Chafe WAX. See the article CHAFE.

Virgin WAX, *Propolis*, is a ſort of reddiſh *wax*, uſed by the bees to ſtop up the clefts, or holes of the hive.— It is applied juſt as taken out of the hive, without any art, or preparation of boiling, *&c.*— It is the moſt tenacious of any, and is held good for the nerves. See PROPOLIS, and VIRGIN.

Sealing WAX, or *Spaniſh* WAX, is a compoſition of gumlacca, melted and prepared with roſin and chalk, and coloured red with ground cinnabar. See LACCA.

WAX-*Candles*. See the article CANDLE.

WAX-WORK.— Here we muſt not forget that pretty invention of M. Benoiſt, a man famous at Paris for his figures of *wax.*— Being, by profeſſion, a painter, he found the ſecret of forming moulds on the faces of living perſons, even the faireſt and moſt delicate, without any danger, either to their health, or complexion: in which moulds he caſt maſks of *wax*; to which, by his colours, and glaſs eyes imitated from nature, he gave a ſort of life: inſomuch, as when clothed in proper habits, they bore ſuch a reſemblance, that it was difficult diſtinguiſhing between the copy and the original.

Grafting WAX, is a compoſition ſerving to bind or fix the bud, or graft in the cleft of the ſtock. See ENGRAFTING.

Inſtead of *grafting wax*, the country gardeners, *&c.* only uſe clay, which they lay over a piece of linen cloth, and ſo keep it moiſt; and to prevent its cracking with the heat of the ſun, tie moſs over it.— But the *wax* ordinarily uſed, is a compoſt of one pound and a half of pitch, a quarter of a pound of *wax*, and an ounce of oil of almonds, melted and mixed together; with the addition, in ſpring or autumn, of a moderate quantity of turpentine. See MUMMY.

For cleft-grafting, whip-grafting, and grafting by approach, Mr. Mortimer recommends tempered clay, or ſoft *wax*; but for rind-grafting, clay and horſe-dung.

WAXING, *Ceratio*, in chymiſtry, the preparation of any matter to render it fit and diſpoſed to liquify, or melt, which of itſelf it was not.

This is frequently done, to enable things to penetrate into metals, or other ſolid bodies.

WAX-SCOT, or WAX-SHOT, *Ceragium*, in our antient cuſtoms, money paid twice a year towards the charge of maintaining lights, or candles in the church.

WAY, *Via*. See ROAD, and VIA; ſee alſo WEIGH.

Roman *ways* are divided into *conſular*, *prætorian*, *military*, and *public*. See MILITARY, &c.

We have four notable ones in England; antiently called *chimini quatuor*, and entitled to the privileges of pax regis. The firſt *Watling-ſtreet*, or *Watheling-ſtreet*, leading from Dover to London, Dunſtable, Touceſter, Atterſton, and the Severn, near the Wrekin in Shropſhire, extending as far as Angleſea in Wales.— The ſecond, called *Hikenild*, or *Ikenild-ſtreet*, ſtretches from Southampton, over the river Iſis at Newbridge, thence by Camden and Lichfield, then paſſes the Derwent near Derby, ſo to Bolſover-Caſtle, and ends at Tinmouth.— The third, called *Foſſe-Way*, becauſe in ſome places it was never perfected, but lies as a large ditch; leads from Cornwal through Devonſhire, by Tetbury near Stow in the Wolds; and beſide Coventry to Leiceſter, Newark, ſo to Lincoln.— The fourth, called *Erming*, or *Erminage-ſtreet*, ſtretches from S. David's in Weſt-Wales, to Southampton.

Milky WAY. See the article GALAXY.

WAY *of a ſhip*, is ſometimes uſed for the ſame with the *rake*, or run of her, forward and afterward on. See RUN.

But the term is more commonly underſtood, in reſpect of her ſailing.— When ſhe goes apace, they ſay, *ſhe has a good way*; and they call the account how faſt ſhe ſails by the log, *keeping an account of her way*. See LOG.

And becauſe moſt ſhips are apt to fall a little to the lee-ward of their true courſe; they always, in caſting up the log-board, allow ſomething for her *leeward way:* which is one point, or more, according to her *way* of ſailing. See LEE-WAY.

WAY *of the rounds*, *chemin des rondes*, in fortification, is a ſpace left for the paſſage of the rounds, between the rampart, and the wall of a fortified town. See ROUND.

This is not now much in uſe; becauſe the parapet not being above a foot thick, it is ſoon overthrown by the enemy's cannon.

Covert-WAY.	See the article	COVERT.
Foſſe-WAY.		FOSSE-*Way*.
Gang-WAY.		GANG-*Way*.
Hatch-WAY.		HATCH-*Way*.
Spur-WAY.		SPUR-*Way*.
Water-WAY.		WATER-*Way*.

WAY-WISER, an inſtrument for meaſuring the road, or diſtance gone; called alſo *perambulator*, and *podometer*, or *pedometer*. See PERAMBULATOR, and PEDOMETER.

WAYWODE, is properly a title given the governors of the chief places in the dominions of the czar of Muſcovy.

The palatines, or governors of provinces in Poland, alſo bear the quality of *waywodes*, or *waiwodes*. See PALATINE.

The Poles likewiſe call the princes of Walachia and Moldavia, *waywodes*; as eſteeming them no other, than on the foot of governors; pretending that Walachia and Moldavia are provinces of Poland, which have withdrawn themſelves from the obedience of the republic.— Every where elſe theſe are called *hoſpodars*. See HOSPODAR.

Du Cange ſays, that the name *waywode* is uſed in Dalmatia, Croatia, and Hungary, for a *general of an army*: and Leunclavius, in his *Pandects of Turkey*, tells us, it uſually ſignifies *captain*, or *commander*.

WEAK *Pulſe*. See the article PULSE.

WEALD, or WELD, the woody part of a country; as the *Weald* of Kent.— It is miſ-printed in ſome books and maps, The *Wilds* of Kent, Suſſex, and Surry.

WEANEL, a country word for a young beaſt newly weaned, or taken from ſucking its dam.

WEANING, *Ablactation*. See ABLACTATION.

WEAPONS. See the articles ARMS, and ARMOUR.

WEAPON-*Salve*, a kind of unguent, ſuppoſed to cure wounds ſympathetically, by being applied, not to the wound, but to the *weapon* that made it. See SYMPATHETIC *Powder*, TRANSPLANTATION, &c.

WEAR, or WEER, a great ſtank, or dam in a river; fitted for the taking of fiſh, or for conveying the ſtream to the mill. See FISHING.

WEATHER, the ſtate or diſpoſition of the atmoſphere, with regard to moiſture or drought, heat or cold, wind or calm, rain, hail, froſt, ſnow, fog, *&c.* See ATMOSPHERE, RAIN, HEAT, WIND, HAIL, FROST, *&c.*

As it is in the atmoſphere that all plants and animals live and breathe, and as that appears to be the great principle of moſt animal and vegetable productions, alterations, *&c.* (See AIR.)— There does not ſeem any thing in all philoſophy, of more immediate concernment to us, than the ſtate of the *weather*.— In effect, all living things are only aſſemblages, on bundles of veſſels, whoſe juices are kept moving by the preſſure of the atmoſphere; and which, by that motion maintain life. So that any alterations in the rarity or denſity, the heat, purity, *&c.* of that, muſt neceſſarily be attended with proportionable ones in theſe.

What vaſt, yet regular alterations, a little turn of *weather* makes, in a tube filled with mercury, or ſpirit of wine, or in a piece of ſtring, *&c.* every body knows, in the common inſtance of barometers, thermometers, hygrometers, *&c.* and it is owing partly to our inattention, and partly to our unequal, intemperate courſe of living, that we do not feel as great and as regular ones in the tubes, chords, and fibres, of our own bodies.

It is certain, a great part of the brute creation have a ſenſibility, and ſagacity this way, beyond mankind; and yet, without any means or diſpoſition thereto, more than we; except that their veſſels, fibres, *&c.* being, in other reſpects, in one equable habitude; the ſame, or a proportionable cauſe from without, has always a like, or proportionable effect on them: that is, their veſſels are regular barometers, *&c.* affected only from one external principle, *viz.* the diſpoſition of the atmoſphere; whereas ours are acted on by divers from within, as well as without; ſome of which check, impede, and prevent the action of others. See BAROMETER, THERMOMETER, HYGROMETER, &c.

We know of nothing more wanting than a juſt theory of the *weather*, on mechanical principles.— But, in order to that, a compleat hiſtory of the *weather* will be required.

Were regiſters carefully kept in divers parts of the globe, for a good ſeries of years, we ſhould be enabled to determine the directions, breadth, and bounds of the winds, and of the *weather* they bring with them; the correſpondence between the *weather* of divers places, and the dependance between one ſort and another at the ſame place.— In time, no doubt, we might learn to foretel divers great emergencies; as, extraordinary heats, rains, froſts, droughts, dearths, plagues, and other epidemical diſeaſes, *&c.*

The members of our Royal ſociety, the French academy of ſciences, and divers other authors of note, have made ſome eſſays this way; but the drineſs and quaintneſs of the ſubjects, has induced them all to drop it.

Eraſ. Bartholin, for inſtance, has obſervations of the *weather* for every day throughout the year 1671: Mr. W. Merle made the like at Oxford, for ſeven years, *viz.* the years 1337, 1338, 1339, 1340, 1341, 1342, 1343. Dr. Plot did the ſame at the ſame place, for the year 1684: Mr. Hillier, at Cape Corſe, for the years 1686, 1687: Mr. Hunt, *&c.* at Greſham College, for the years 1695, 1696; Mr. Derham, at Upminſter in Eſſex, for the years 1691, 1692, 1697, 1698, 1699, 1703, 1704, 1705; Mr. Townley, in Lancaſhire, in 1697, 1698; Mr. Cunningham, at Emin in China, for the years 1698, 1699, 1700, 1701; Mr. Locke, at Oats in Eſſex, 1692; Dr. Scheuchzer, at Zurich, in 1708; and Dr. Tilly, at Piſa, the ſame year. See the *Philoſoph. Tranſact.*

The form of Mr. Derham's obſervation, we give as a ſpecimen of a journal of this kind; obſerving that he notes the ſtrength of the winds, by 0, 1, 2, 3, *&c.* and the quantity of rain, as it fell through a tunnel, in pounds and centeſimals.

Phænomena of the WEATHER, October 1697.

Day.	Hour.	Weather.	Wind.		Barometer.		Rain.

	9	Stormy		0	29	88	0	29

As a ſpecimen of the uſe of ſuch hiſtories, we ſhall add ſome general remarks, drawn from them by Mr. Derham; and,

—1°. That foggy *weather* makes the mercury riſe in the barometer, as well as the north wind.— The cauſe, he ſuggeſts, probably enough, to be the acceſſion of the load of vapour, to the former weight of the atmoſphere. See FOG. *Miſling weather*, he likewiſe obſerves to have the like effect. See BAROMETER.

2°. The colds and heats in England and Switzerland, begin and end nearly about the ſame time: nay, and any remarkable *weather*, eſpecially if it continue any while, affects one place as well as the other. See HEAT.

3°. That the remarkably cold days in June, anno 1708, were found, in Switzerland, to precede ours, commonly by about five days, or more; and that the remarkable heats in the following months, began to abate in both places about the ſame time; only ſomewhat ſooner here than there. See COLD.

4°. That though the winds in both places frequently agree, yet they oftener differ. See WIND.

5°. That the barometer is always lower at Zurich than at Upminſter, by ſometimes one, and ſometimes above two Engliſh inches; but the common difference is about half an inch. Which may be ſolved, either by ſuppoſing Zurich ſituate one fourth of a mile higher above the level of the ſea than Upminſter; or elſe, by ſuppoſing that part of the terraqueous globe, as lying nearer the line, to be higher, and more diſtant from the centre than ours is, which lies nearer the pole. See EARTH, MOUNTAIN, *&c.*

6°. That the barometers generally riſe and fall together at far diſtant places: though this agreement of the barometer is not ſo conſtant between Zurich and Upminſter, as in places nearer home, *viz.* at London and Paris; where, again, the agreement is not ſo great as between Upminſter and Lancaſhire.

7°. That the variations of the barometer are greateſt, as the places are neareſt the pole.— Thus, *e. gr.* the mercury at London has a greater range by two or three lines than at Paris; and at Paris, a greater than at Zurich.— In ſome places near the equinoctial, there is ſcarce any variation at all. See BAROMETER.

8°. That the rain in Switzerland and Italy is much greater in quantity, throughout the year, than that in Eſſex; yet the rains are more frequent, *i. e.* there are more rainy days in Eſſex, than at either of thoſe places.— The proportion of the annual rains that fall in ſeveral places we have any good obſervations of, ſtand thus: At Zurich, the depth of the annual rain, at a medium, is about 32 $\frac{1}{2}$ Engliſh inches; at Piſa, 43 $\frac{1}{4}$; at Paris, 23; at Liſle in Flanders, 23 $\frac{1}{2}$ inches; at Townley in Lancaſhire, 42 $\frac{1}{2}$; at Upminſter, 19 $\frac{1}{4}$. See RAIN.

9°. That cold contributes greatly to rain; and that, apparently, by condenſing the ſuſpended vapours, and making them deſcend.— Thus, very cold months, or ſeaſons, are generally followed immediately by very rainy ones; and cold ſummers are always wet ones. See COLD, and VAPOUR.

10°. That high ridges of mountains, as the Alps, and the ſnows they are covered withal, not only affect the neighbouring places by the colds, rains, vapours, *&c.* they produce, but even diſtant countries, as England, often partake of their effects.— Thus, the extraordinary colds, December 1708, and the relaxations thereof, were felt in Italy and Switzerland, ſeveral days ere they reached us: an indication, Mr. Derham thinks, that they were derived from them to us.

Prognoſtics of the WEATHER.— We do not here mean to obtrude the idle, arbitrary obſervations of fanciful people upon our reader.— That cloud of popular predictions from the brute world, which partly the ſagacity, and partly the credulity of our countrymen have eſtabliſhed, we ſet aſide, as not flowing from any natural, neceſſary relations, that we know of, in the things themſelves.— Such is the foretelling of rain and wind, from water-fowls flocking to land, or land-fowls to the water; from birds pruning their feathers, geeſe gaggling, crows cawing loud, and flying in companies, ſwallows chattering, and flying low, peacocks crying much, aſſes braying, deer fighting, foxes and wolves howling, fiſhes playing, ants and bees keeping within doors, moles caſting up earth, earthworms creeping out, *&c.*— We ſhall offer nothing on this head, but what has ſome viſible foundation in the nature of things; and which lets ſome light into the cauſe and reaſon of *weather* itſelf, or diſcovers ſome notable effects thereof.

1°. Then, *a thick, dark ſky, laſting for ſome time, without either ſun or rain, always becomes firſt fair, then foul,* i. e. changes to a fair clear ſky, ere it turns to rain.— This, the rev. Mr. Clarke, who kept a regiſter of the *weather* for 30 years, ſince put into Mr. Derham's hands by his grandſon the learned Dr. Samuel Clarke; this, he ſays, he ſcarce ever knew to fail: at leaſt, when the wind was in any of the eaſterly points: but Mr. Derham has obſerved the rule to hold good, be the wind where it will. And the cauſe is obvious.— The atmoſphere is replete with vapours, which, though ſufficient to reflect and intercept the ſun's rays from us, yet want denſity to deſcend; and while the vapours continue in the ſame ſtate, the *weather* will do ſo too.— Accordingly, ſuch *weather* is generally attended with moderate warmth, and with little or no wind to diſturb the vapours, and an heavy atmoſphere to ſuſtain them; the barometer being commonly high.— But when the cold approaches, and, by condenſing, drives the vapours into clouds or drops, then, way is made for the ſun-beams; till the ſame vapours, being by further condenſation formed into rain, fall down in drops.

2°. *A change in the warmth of the* weather, *is generally followed by a change in the wind.*— Thus, the northerly and ſoutherly winds, commonly eſteemed the cauſes of cold and warm *weather*, are really the effects of the cold or warmth of the atmoſphere: of which Mr. Derham aſſures us he has had ſo many confirmations, that he makes no doubt of it.— Thus, it is common to ſee a warm ſoutherly wind ſuddenly changed to the north, by the fall of ſnow or hail; or to ſee the wind, in a cold froſty morning, north, when the ſun has well warmed the earth and air, wheel towards the ſouth; and again turn northerly or eaſterly in the cold evening.

3°. *Moſt vegetables expand their flowers and down in ſunſhiny* weather, *and towards the evening; and againſt rain, cloſe them again*; eſpecially at the beginning of their flowering, when their ſeeds are tender and ſenſible.— This is viſible enough in the down of dandelion, and other downs: and eminently in the flowers of pimpernel; the opening and ſhutting of which, Gerard obſerves, are the countryman's *weatherwiſer*, whereby he foretels the *weather* of the following day.— The rule is, if the flowers be cloſe ſhut up, it betokens rain and foul *weather*: if they be ſpread abroad, fair *weather*. Ger. Herb. Lib. II.

Eſt & alia [arbor in Tylis] *ſimilis, folioſior tamen, roſeique floris; quem noctu comprimens, aperire incipit ſolis exortu, meridie expandit. Incolæ dormire eum dicunt.* Plin. Nat. Hiſt. Lib. XII. cap. 11.

The ſtalk of trefoil, my lord Bacon obſerves, ſwells againſt rain, and grows more upright: and the like may be obſerved, though not ſo ſenſibly, in the ſtalks of moſt other plants.— He adds, that in the ſtubble fields there is found a ſmall red flower, called, by the country-people, *wincopipe*; which opening in a morning, is a ſure indication of a fine day.

That vegetables ſhould be affected by the ſame cauſes that affect the *weather*, is very conceivable; if we conſider them as ſo many hygrometers, and thermometers, conſiſting of an infinite number of tracheæ, or air-veſſels; by which they have an immediate communication with the air, and partake of its moiſture, heat, *&c.*— Theſe tracheæ are very viſible in the leaf of the ſcabioſe, vine, *&c.* See PLANT, VEGETABLE, *&c.*

Hence it is, that all wood, even the hardeſt and moſt ſolid, ſwells in moiſt *weather*; the vapours eaſily inſinuating into the pores thereof; eſpecially of that which is lighteſt and drieſt.— And hence we derive a very extraordinary uſe of wood, *viz.* for breaking rocks and mill-ſtones. See WOOD.

The method at the quarries is this.— Having cut a rock into a cylinder, they divide that into ſeveral leſſer cylinders, by making holes at proper diſtances round the great one: theſe holes they fill with ſo many pieces of ſallow wood, dried in an oven; which, in moiſt *weather*, becoming impregnated with the humid corpuſcles of the air, ſwell; and, like wedges, break or cleave the rock into ſeveral ſtones.

Predictions of the WEATHER *from the barometer.* See BAROMETER.

WEATHER-COCK, or WEATHER-VANE, a moveable vane, in form of a cock, or other ſhape, placed on high, to be turned round according to the direction of the wind, and point out what quarter the wind blows from. See WIND, and ANEMOMETER.

WEATHER-GLASSES, are inſtruments contrived to indicate the ſtate, or diſpoſition of the atmoſphere, as to heat, cold, gravity, moiſture, *&c.* to meaſure the changes befalling in thoſe reſpects; and, by thoſe means, to predict the alteration of *weather*, as rains, winds, ſnow, *&c.*

Under the claſs of *weather-glaſſes*, are comprehended *barometers, thermometers, hygrometers, manometers,* and *anemometers*, of each whereof there are divers kinds: ſee their theories, conſtructions, uſes, kinds, *&c.* under the reſpective articles, BAROMETER, THERMOMETER, HYGROMETER, &c.

WEATHER-BOARD, in the ſea language, that ſide of a ſhip which is to the windward.

WEATHER GAGE at ſea.— A ſhip is ſaid to have the *weather-gage* of another, when ſhe is to windward of her. See GAGE.

WEATHERING, a doubling, or ſailing by a point, or place.

To *weather a ſhip*, is to get to the windward of her.

The WEATHERING *of a hawk*, among falconers, is the ſetting her abroad to take the air. See HAWK, and HAWKING.

WEAVING, the art or act of working a web of cloth, ſilk, linen, or other ſtuff, on a loom, with a ſhuttle. See LOOM, SHUTTLE, WEB, *&c.*

It is difficult to ſay, with any aſſurance, who it is we owe this admirable invention to, unleſs we chuſe to aſcribe it to the ſpider, that poiſonous, but ingenious little inſect, which draws certain infinitely fine threads from its own ſubſtance through papillæ near its *anus*. See SILK, and WEB.

WEAVING *of Cloth.*	See	CLOTH.
WEAVING *of Tapeſtry*, &c.		TAPESTRY, &c.
Stocking WEAVING.		STOCKINGS.

WEB, a ſort of tiſſue, or texture, formed of threads interwoven with each other; ſome whereof are extended in length, and called the *warp*; and others drawn acroſs them, called the *woof*. See TEXTURE, WOOF, WARP, *&c.*

Spider's WEB, or *Cob*-WEB, is a very delicate and wonderful tiſſue, which that inſect ſpins out of its own bowels; ſerving it as a ſort of toil, or net to catch flies, *&c.* withal.— For the manner wherein the ſpider ſpins his *web*, the admirable mechaniſm of the parts ſubſervient thereto, and the uſes thereof, ſee SILK.

Dr. Liſter tells us, that attending nearly to a ſpider weaving a net, he obſerved it ſuddenly to deſiſt in the mid-work; and turning its tail to the wind, darted out a thread, with the violence and ſtream we ſee water ſpout out of a jet: this thread, taken up by the wind, was immediately emitted ſome fathoms long; ſtill iſſuing out of the belly of the animal.— By and by the ſpider leaped into the air, and the thread mounted her up ſwiftly.— After this diſcovery, he made the like obſervation in near thirty different ſorts of ſpiders; and found the air filled with young and old, ſailing on their threads, and doubtleſs ſeizing gnats and other inſects in their paſſage: there being often manifeſt ſigns of ſlaughter, legs and wings of flies, *&c.* on theſe threads, as well as in their *webs* below.

Dr. Hulſe diſcovered the ſame thing about the ſame time.— In a letter of Dr. Liſter to Mr. Ray, he thinks there is a fair hint of the darting of ſpiders in Ariſtotle, *Hiſt. An.* Lib. IX. cap. 39. and in Pliny, Lib. X. cap. 74. But for their ſailing, the antients are ſilent, and thinks it was firſt ſeen by him.— In another letter to Mr. Ray, dated January 1670, ſpeaking of the heighth ſpiders are able to fly to, he ſays, "Laſt October, *&c.* I took notice that the air was very full of *webs*; I forthwith mounted to the top of the higheſt ſteeple on the Minſter, [in York] and could there diſcern them yet exceeding high above me."

Pin and WEB. See PANNUS.

WEDGE, *Cuneus*, in mechanics, the laſt of the five powers, or ſimple machines. See MECHANICAL *Power*.

The *wedge* is a triangular priſm, whoſe baſes are equilateral acute-angled triangles. See PRISM.

Authors are divided about the principle whence the *wedge* derives its power.— Ariſtotle conſiders it as two levers of the firſt kind, inclined toward each other, and acting oppoſite ways.— Guido Ubaldus, Merſennus, *&c.* will have them levers of the ſecond kind.— But Fr. de Lanis ſhews, that the *wedge* cannot be reduced to any lever at all. See LEVER.

Others refer the *wedge* to the inclined plane.— Others, again, with De Stair, deny the *wedge* to have ſcarce any force at all; and aſcribe much the greateſt part to the mallet that drives it.— But the lateſt Authors agree to refer the effect of the *wedge*, to the cochlea, or ſcrew. See SCREW.

Its doctrine is contained in this propoſition.— "If a power be applied to a *wedge*, in ſuch manner, as that the line of direction CD, (*Tab. Mechanics, fig.* 53.) perpendicular to AB, is to the reſiſtance to be overcome, as AB to CD; the power will be equal to the reſiſtance."

Or thus: "If the power directly applied to the head of the *wedge*, be to the reſiſtance to be overcome by the *wedge*, as the thickneſs of the *wedge* is to its heighth; then the power will be equivalent to its reſiſtance; and, if increaſed, will overcome it."

For the firmneſs whereby the parts of the obſtacle, ſuppoſe wood, adhere to one another, is the reſiſtance to be overcome by the *wedge*. See FIRMNESS, and RESISTANCE.

Now it is evident, that while the *wedge* is drove into the wood, the way or length it has gone is BA, (*fig.* 54.) and DC is the way or length gone in the ſame time, by the impediment; that is, the parts C and D of the wood, are ſo far divided aſunder: and according as the *wedge* is drove down farther and farther along its heighth; ſo the parts C and D of the wood, are divided more and more, along the thickneſs of the *wedge*.

Hence, if the thickneſs of the *wedge* (that is, the way of the impediment, and conſequently its velocity) be to the heighth of the *wedge* (that is, the way, and conſequently the velocity of the power) as the power to the impediment, or reſiſtance; then the momentum of the power, and the impediment, will be equal the one to the other; and conſequently the power, being increaſed, will overcome the reſiſtance.

Hence, 1°. the power equivalent to half the reſiſtance, is to it as A C to D C, *fig.* 53. that is, as the whole ſine to the cotangent of half the angle of the *wedge* A D C.— And, 2°. as the tangent of a leſs angle is leſs than that of a greater, the power muſt have a greater proportion to half the reſiſtance, if the angle be greater, than if leſs.— Conſequently, the acuter the *wedge* is, the more does it increaſe the power.

To the *wedge* may be referred all edge-tools, and inſtruments which have a ſharp point, in order to cut, cleave, ſlit, chop, pierce, bore, or the like; as knives, hatchets, ſwords, bodkins, &c.

WEDLOCK. See Marriage, Wife, Husband, &c.

WEDNESDAY. See the article Month, Day, &c.

Aſh-Wednesday. See the article Ash-*Wedneſday*.

WEED, a common name for all rank and wild herbs, that grow of themſelves, to the detriment of other uſeful herbs they grow among. See Plant, Herb, &c.

Dyer's Weed, *woodwax*, or *geniſta tinctoria*, See Dying.

Fuller's Weed. See the articles Thistle, and Teazle.

Weed, in the miners language, denotes the degeneracy of a load or vein of fine metal, into an uſeleſs marcaſite. See Vein, Mine, Metal, Marcasite, &c.

Weeds, alſo denote a peculiar habit, wore by the relicts of perſons deceaſed, by way of mourning. See Mourning.

WEEK, *Septimana*, *Hebdomada*, in chronology, a diviſion of time, compriſing ſeven days. See Time, and Day.

The origin of this diviſion of *weeks*, or of computing time by ſevenths, is greatly controverted.— Some will have it to take its riſe from the four quarters or intervals of the moon, between her changes of phaſes, which being about ſeven days diſtant, gave occaſion to the diviſion. See Moon, Quarter, &c.

Be this as it will, the diviſion is certainly very antient.— The Syrians, Egyptians, and moſt of the oriental nations, appear to have uſed it from all antiquity: though it did not get footing in the weſt, till Chriſtianity brought it in: the Romans reckoned their days not by ſevenths, but by ninths; and the antient Greeks by decads, or tenths.

Indeed, the Jews divided their time by *weeks*, but it was upon a different principle from the other eaſtern nations.— God himſelf having appointed them to work ſix days, and to reſt the ſeventh, in order to keep up the ſenſe and remembrance of the creation; which being effected in ſix days, he reſted the ſeventh. See Sabbath.

Some authors will even have the uſe of *weeks*, among the other eaſtern nations, to have proceeded from the Jews; but with little appearance of probability.— It is with better reaſon that others ſuppoſe the uſe of *weeks* among the heathens of the eaſt, to be a remain of the tradition of the creation, which they had ſtill retained with divers others.

This is the opinion of Grotius, *De Veritat. Relig. Chriſt.* Lib. I. who likewiſe proves, that not only throughout the eaſt, but even among the Greeks, Italians, Celtæ, Sclavi, and even the Romans themſelves, the days were divided into *weeks*; and that the ſeventh day was in extraordinary veneration.— This appears from Joſeph. *adv. Appion.* II. Philo *De Creatione*, Clem. Alexand. *Strom.* Lib. V.— Though Helmoldus, Lib. I. cap. 84. Philoſtratus, Lib. III. cap. 13. Dion. Lib. XXXVIII. Tibullus, Lucian, Homer, Callimachus, Suetonius, Herodotus, &c. who mention the ſeptenary diviſion of days as very antient, ſuppoſe it to have been derived from the Egyptians.

The *Days of the Week* were denominated by the Jews, from the order of their ſucceſſion from the ſabbath.— Thus, the day next after the ſabbath, they called the *firſt* of the ſabbath, the next, the *ſecond* of the ſabbath, and ſo of the reſt; except the ſixth, which they called *paraſceve*, or preparation of the ſabbath. See Parasceve.

The like method is ſtill kept up by the Chriſtian Arabs, Perſians, Ethiopians, &c.— The antient heathens denominated the days of the *week* from the ſeven planets; which names are ſtill generally retained among the Chriſtians of the weſt.— Thus, the firſt day was called *ſun-day*, dies ſolis; the ſecond *moon-day*, dies lunæ, &c. a practice the more natural on Dion's principle, who ſays, the Egyptians took the diviſion of the *week* itſelf from the ſeven planets.

In effect, the true reaſon of theſe denominations ſeems to be founded in aſtrology.— For the aſtrologers, diſtributing the government and direction of all the hours in the *week* among the ſeven planets, ♄ ♃ ♂ ☉ ♀ ☿ ☽, ſo as that the government of the firſt hour of the firſt day fell to Saturn, that of the ſecond day to Jupiter, &c. they gave each day the name of the planet which preſided over the firſt hour thereof: and that, according to the order ſpecified above; and which is included in the following technical verſe:

Poſt SIM SUM *ſequitur, pallida Luna ſubeſt.*

Wherein, the capital letters SIM SUM and L, are the initial letters of the planets.— So that, the order of the planets in the *week*, bears little relation to that in which they follow in the heavens: the former being founded on an imaginary power each planet has, in its turn, on the firſt hour of each day. See Planet, Hour, House, Ascendent, Horoscope, &c.

Dion. Caſſius gives another reaſon of the denomination, fetched from the celeſtial harmony.— For it being obſerved that the harmony of the diateſſaron, which conſiſts in the ratio of 4 to 3, is of great force and effect in muſic; it was judged meet to proceed directly from Saturn to the Sun; becauſe there are three planets between Saturn and the Sun, and four from the Sun to the Moon. See Diatessaron, Harmony *of the Spheres*, &c.

To find the accompliſhment of Daniel's prophecy of the Meſſiah, the deſtruction, rebuilding, &c. of the temple, chap. ix. ver. 24, &c. the critics generally agree to underſtand *weeks of years*, inſtead of *weeks of days*. See Prophecy, Year, &c.

Ember Weeks. See the article Ember.

Paſſion Week, or *the holy* Week, is the laſt *week* in Lent, wherein the church celebrates the myſtery of our Saviour's death and paſſion. See Lent, Passion, &c.

This is ſometimes alſo called *the great week*.— Its inſtitution is generally referred, both by Proteſtants and Papiſts, to the times of the apoſtles.— All the days of that *week* were held as faſts: no work was done on them; no juſtice diſtributed; but the priſoners were ordinarily ſet at liberty, &c. even pleaſures otherwiſe allowed, but now prohibited.

The oſculum charitatis was now forborn; and divers mortifications practiſed by all ſorts of people, and even the emperors themſelves.

Rogation Week. See the article Rogation.

Week, or Wieck *of a candle*, &c. the cotton match in a candle or lamp. See Candle, Lamp, &c.

WEEPING. See the article Tears.

WEER. See the article Wear.

WEFT, a kind of web, or thing woven: as, a *weft* or treſs of hair. See Web, Hair, Tissue, &c.

WEIF. See the article Waif.

WEIGH*, Way, or Wey, *Waga*, a weight of cheeſe, wool, &c. containing 256 pounds averdupois.— Of corn, the *weigh* contains 40 buſhels; of barley or malt, 6 quarters. — In ſome places, as Eſſex, the *weigh* of cheeſe is 300 pounds. See Measure.

* — *Et decimam caſei ſui de Herting, præter unam peiſam quæ pertinet ad eccleſiam de* A. Mon. Angl. where *peiſa* ſeems to be uſed for a *weigh*.— Coke alſo ſpeaks of *weighs* of bay ſalt.

WEIGHER, an officer in divers cities, appointed to *weigh* the commodities bought or ſold, in a public balance, &c.

Theſe *weighers* are generally obliged by oath, to do juſtice to both parties; and to keep a regiſter of the things they weigh.— In Amſterdam there are twelve *weighers*, eſtabliſhed into a kind of office.

As it was formerly allowed them to touch the ſtrings of the balance of *weighing*, it was eaſy for them to favour either the buyer or ſeller, according as the one gave them more money than the other.— To prevent which abuſe, it was charged on them, by an ordinance of the burgomaſters, in 1719, not to touch the balance in any manner whatever.

WEIGHING, the act of examining a body in the balance, to find its *weight*. See Balance, and Weight.

The diſtillers in London *weigh* their veſſels when full; and for half a hogſhead, which is 31 gallons and an half, allow 200 one quarter and 11 pounds for the caſk and liquor.— For a puncheon, they allow 600 one quarter and 2 pounds: for a canary pipe 800 a half and 17 pounds.

Weighing-*Chair*, a machine contrived by Sanctorius, to determine the quantity of food taken at a meal, and to warn the feeder when he had eat his quantum.

That ingenious author having obſerved, with many others, that a great part of our diſorders ariſe from the exceſs in the quantity of our foods, more than in the quality thereof; as alſo how much a fixed portion, once well adjuſted, would, if kept to regularly, contribute to health; bethought himſelf of an expedient to that purpoſe.— The reſult was the *weighing-chair:* which was a chair fixed at one arm of a ſort of balance, wherein a perſon being ſeated at meat, as ſoon as he had eat his allowance, the increaſe of *weight* made his ſeat preponderate: So that, deſcending to the ground, he left his table, victuals, and all out of reach. See Perspiration.

Weighing *of the air*. See the article Weight *of air*.

Weighing *Anchor*, in the ſea language, is the drawing up the anchor out of the ground it had been caſt into; in order to ſet ſail, or quit a port, road, or the like. See Anchor.

The anchor is ordinarily *weighed* or recovered by means of the capſtan; ſometimes by a windlaſs. See Windlass, and Capstan.

WEIGHT, *Gravity*, *Pondus*, in phyſics, a quality in natural bodies, whereby they tend downwards, toward the centre of the earth. See BODY, DESCENT, EARTH, &c.

Or, *weight* may be defined, in a leſs limited manner, to be a power inherent in all bodies, whereby they tend to ſome common point, called the *centre of gravity*; and that with a greater or leſs velocity, as they are more or leſs denſe, or as the medium they paſs through is more or leſs rare. See CENTRE, DENSITY, &c.

In the common uſe of language, *weight* and *gravity* are conſidered as one and the ſame thing.— Some authors, however, make a difference between them; and hold *gravity* only to expreſs a *niſus*, or endeavour to deſcend; but *weight* an actual deſcent.

But there is room for a better diſtinction.— In effect, one may conceive gravity to be the quality, as inherent in the body; and *weight*, the ſame quality, exerting itſelf, either againſt an obſtacle, or otherwiſe. See QUALITY, &c.

Hence, *weight* may be diſtinguiſhed, like gravity, into *abſolute*, and *ſpecific*. See GRAVITY.

Sir Iſaac Newton demonſtrates, that the *weights* of all bodies, at equal diſtances from the centre of the earth, are proportionable to the quantities of matter each contains.— Whence it follows, that the *weights* of bodies have not any dependance on their forms, or textures; and that all ſpaces are not equally full of matter. See VACUUM.

Hence alſo it follows, that the *weight* of the ſame body is different, on the ſurface of different Parts of the earth; by reaſon its figure is not a ſphere, but a ſpheroid. See PENDULUM.

The law of this difference, the ſame author gives in the following theorem.— "The increaſe of *weight*, as you proceed "from the equator to the poles, is, nearly, as the verſed "ſine of double the latitude; or, which amounts to the "ſame, as the ſquare of the right ſine of the latitude."

Therefore, ſince the latitude of Paris is 48° 50′, that of a place under the equator 00° 00′; and that of a place under the pole 90° 00′; and the verſed ſines of the double latitudes are 11334,00000 and 20000, the radius being 10000; and the *weight* at the pole, is to the *weight* at the equator, as 230 to 229; and the exceſs of *weight* at the pole, to that at the equator, as 1 to 229: the exceſs of gravity in the latitude of Paris, to that under the equator, will be as $1 \times \frac{11334}{20000}$ to 229, or as 5667, to 2290000; and therefore, the whole *weights* in thoſe places, will be to each other as 2295667, to 2290000.

Hence alſo, as the lengths of pendulums that perform their vibrations in equal times, are as their *weights*; and the length of a pendulum, which in the latitude of Paris vibrates ſeconds, is three Paris feet, and eight lines $\frac{5}{9}$: the length of a pendulum, that vibrates ſeconds under the equator, will be ſhort of a ſynchronous pendulum at Paris, by one line, and an 87000th part of a line. *Phil. Nat. Princ. Math.* Lib. III. p. 382, &c. See PENDULUM.

A body immerged in a fluid ſpecifically lighter than itſelf, loſes ſo much of it *weight*, as is equal to the *weight* of a quantity of the fluid of the ſame bulk with itſelf. See FLUID.

Hence, a body loſes more of its *weight* in a heavier than in a lighter fluid; and therefore weighs more in a lighter, than a heavier fluid. See SPECIFIC *Gravity*.

To find the weight *of any quantity of a fluid*, *e. gr.* of the wine contained in a hogſhead.— Find the bulk or quantity of the liquor by the rules of gauging. See GAUGING.

Suſpend a cubic inch of lead therein by a horſe-hair; and by a balance note the *weight* loſt.— This will be the *weight* of a cubic inch of the fluid.

Wherefore, ſince in a homogeneous fluid, the *weight* is proportionable to the bulk; the *weight* of the fluid will be found by the rule of three.— Thus, if the capacity of the Hogſhead be 88 cubic feet, and the cubic foot of wine 68 pounds, the whole *weight* of the wine will be 5984.

The *weight* of a cubic foot of water, has been determined by ſeveral; but as in different ſprings, &c. the *weight* of the water is different, and there is even a difference in the ſame water at different times; it is no wonder the obſervations of the ſeveral authors ſhould be found very different.— Dr. Wiberd, by repeated experiments, found a cubic foot of water to weigh 76 pounds troy. See WATER.

WEIGHT, *Pondus*, in mechanics, is any thing to be raiſed, ſuſtained, or moved by a machine; or any thing that in any manner reſiſts the motion to be produced. See MOTION, &c.

In all machines, there is a natural ratio between the *weight*, and the moving power.— If the *weight* be increaſed, the power muſt be ſo too; that is, the wheels, &c. are to be multiplied, and ſo the time increaſed, or the velocity diminiſhed. See POWER and MACHINE.

"The centre of gravity F, (*Tab. Mechanics, fig.* 55.) of a "body I H, together with the *weight* of the body, being given; "to determine the point M, in which, lying on an horizontal plane, a given *weight* G, hung in L, cannot remove "the body I H out of its horizontal ſituation."

Conceive a *weight* hung in the centre of gravity F, equal to the *weight* of the whole Body I H, and find the common centre of gravity M, of that and the given *weight* G.— If the point M be laid on the horizontal plane, the *weight* G will not be able to move the body H I out of its place.

Suppoſe, *e. gr.* F the centre of gravity of the ſtaff, which is diſtant from its extremity, by the ſpace I F 20 inches; the bucket of water to weigh 24 pounds, and the *weight* of the ſtaff to be 2 L F = 18 ounces: we ſhall find L M = L F. F. (G + F) = 18. 2 : 22 :: 18 : 11 = $\frac{4}{1}$; ſo that it is no wonder the bucket hung on the ſtaff I H, laid on the table, does not fall.

"The centre of gravity C, (*fig.* 56.) of a body A B, together with its *weight* G, being given; to determine "the points L and M, wherein props N and O are to be "placed, that each may bear any given proportion of the "*weight*."

In the horizontal line A B, paſſing through the centre of gravity C, aſſume the right lines M C and C L in the given ratio.— Props, then, N, O, placed in theſe points, will be preſſed in the given ratio.

Hence, if in the points M, L, in lieu of props, you place the ſhoulders, or arms of porters, &c. they will be able to bear the burden alike; if their ſhares be proportioned to their ſtrengths.— Thus we have a way of diſtributing a burden in any given ratio.

WEIGHT *of the atmoſphere.* See ATMOSPHERE.

WEIGHT in commerce, denotes a body of a known weight, appointed to be put in the balance againſt other bodies, whoſe weight is required. See WEIGHING, BALANCE, &c.

Theſe *weights* are uſually of lead, iron, or braſs; though in divers parts of the Eaſt-Indies they are common flints, and in ſome places, a ſort of little beans.

The ſecurity of commerce depending, in good meaſure, on the juſtneſs of theſe *weights*; there is ſcarce any nation, but has taken proper meaſures to prevent the falſification thereof. — The ſureſt means are the ſtamping, or making them by proper officers, from ſome original or ſtandard, depoſited where recourſe may be had to them.

This expedient is very antient; and many authors are of opinion, that what among the Jews was called *ſhekel of the ſanctuary*, was not any particular kind of *weight*, different from the common one; but a ſtandard or original *weight*, preſerved by the prieſts in the ſanctuary. See SHEKEL, and SANCTUARY.

Thus, alſo, in England, the ſtandard of *weights* is kept in the Exchequer, by a particular officer, called the *clerk*, or *comptroller of the market*.— In France the ſtandard *weight* is kept under ſeveral keys, in the cabinet of the cour des Monnoyes. See STANDARD.

Moſt nations, wherein there is any thing of commerce flouriſhing, have their particular *weights*; and even ſometimes different *weights* in the different provinces, and for the different kinds of commodities.

This diverſity of *weights*, makes one of the moſt perplexing articles in commerce; but it is irremediable.— The reducing the *weights* of different nations to one, is not only impracticable; but even the reduction of thoſe of the ſame nation: witneſs thoſe vain attempts made for reducing the *weights* in France by ſo many of their kings, Charlemaign, Philip the long, Louis XI. Francis I. Henry II. Charles IX. Henry III. Louis XIV.

Weights may be diſtinguiſhed into *antient*, and *modern*, *foreign*, and *domeſtic*.

Modern **WEIGHTS**, *uſed in the ſeveral parts of Europe, and the Levant.*

Engliſh **WEIGHTS**.— By the twenty-ſeventh chapter of *Magna Charta*, the *weights* are to be the ſame all over England; but for different commodities there are two different ſorts, *viz. troy weight*, and *averdupois weight*.

The origin from which they are both raiſed, is the grain of wheat, gathered in the middle of the ear. See GRAIN.

In Troy **WEIGHT**, 24 of theſe *grains* make a *penny weight* ſterling; 20 *penny weight* make an *ounce*; and 12 ounces a *pound*. See OUNCE, POUND, &c.

By this *weight* we weigh gold, ſilver, jewels, grains, and liquors.— The apothecaries alſo uſe the *troy pound*, *ounce*, and *grain*; but they differ from the reſt, in the intermediate diviſions — They divide the ounce into 8 *drachms*; the drachm into 3 *ſcruples*; and the ſcruple into 20 *grains*. See DRACHM, SCRUPLE, &c.

In Averdupois **WEIGHT**, the *pound* contains 16 *ounces*; but the ounce is leſs by near $\frac{1}{12}$ than the troy ounce; this latter containing 490 grains, and the former only 448.— The ounce contains 16 drachms— 80 ounces averdupois, are only equal to 73 ounces troy; and 17 pounds troy, equal to 14 pounds averdupois. See POUND.

By *averdupois weight*, are weighed mercury and grocery wares, baſe metals, wool, tallow, hemp, drugs, bread, &c. See AVERDUPOIS.

Table of *Troy Weight*, as uſed by the

Goldſmiths, *&c.*

Grains.			
24	Penny-weight.		
480	20	Ounce.	
5760	240	12	Pound.

Apothecaries.

Grains.				
20	Scruple.

384	128	16	Pound.		
43008	14336	1792	112	Quintal, or Hundred.	
860160	286720	35840	2240	20	Tun.

The moneyers, jewellers, *&c.* have a particular claſs of *weights*, for gold and precious ſtones, *viz. carat*, and *grain*; and for ſilver, the *penny-weight*, and *grain.* See CARAT; ſee alſo GOLD, and SILVER.

The moneyers have alſo a peculiar ſubdiviſion of the *grain* troy: Thus;

$$\text{The}\left\{\begin{array}{l}\textit{Grain}\\ \textit{Mite}\\ \textit{Droit}\\ \textit{Perit}\end{array}\right\}\text{into}\left\{\begin{array}{l}20\ \textit{Mites.}\\ 24\ \textit{Droits.}\\ 20\ \textit{Perits.}\\ 24\ \textit{Blanks.}\end{array}\right.$$

The dealers in wool have likewiſe a particular ſet of *weights*, *viz.* the *ſack*, *weigh*, *tod*, *ſtone*, and *clove*. See WEIGH, &c.— The proportion of which, ſee under the article WOOL.

French WEIGHTS.— The common or *Paris pound*, is 16 ounces; which they divide two ways: the firſt diviſion is into two *marcs*, the marc into 8 *ounces*; the ounce into 8 *gros*; the gros into 3 *penny-weights*; the penny-weight into 24 *grains*; the grain equivalent to a grain of wheat. — The ſecond diviſion of the pound, is into 2 *half-pounds*; the half-pound into 2 *quarters*; the quarter into 2 *half-quarters*; the half-quarter into 2 *ounces*; and the ounce into two *half-ounces.*

The *weights* of the firſt diviſion are uſed to weigh gold, ſilver, and the richer commodities: and the *weights* of the ſecond diviſion, for commodities of leſs value.

Grains.					
24	Penny-weight.				
72	3	Gros.			
576	24	8	Ounce.		
7008	192	64	8	Marc.

16	8	4	2	Half pound.		
32	16	8	4	2	Pound.	
3200	1600	800	400	200	100	Quintal.

But the pound is not the ſame throughout France.— At Lyons, *e. gr.* the city pound is only 14 ounces: ſo that 100 Lyons pounds, make only 88 Paris Pounds.— But beſide the city pound, they have another at Lyons for ſilk, containing 16 ounces.— At Tholouſe, and throughout the Upper Languedoc, the pound is 13 ounces and $\frac{1}{2}$ of Paris *weight.*— At Marſeilles, and throughout Provence, the pound is 13 ounces of Paris *weight.*— At Rouen, beſide the common Paris pound and marc, they have the *weight* of the *vicomte*; which is 16 ounces and $\frac{1}{2}$ and $\frac{1}{6}$, of the Paris *weight.*

The *weights* enumerated under the two articles of Engliſh and French *weights*, are the ſame that are uſed throughout the greateſt part of Europe; only under ſomewhat different names, diviſions, and proportions. See POUND, GROS, MARC, PENNY-WEIGHT, &c.

Particular nations, have alſo certain *weights* peculiar to themſelves: Thus, Spain has its *arrobas*, containing 25 Spaniſh pounds, or $\frac{1}{4}$ of the common quintal: its *quintal macho*, containing 150 pounds, or 1$\frac{1}{2}$ common quintal, or 6 *arrobas*: its *adarme*, containing $\frac{1}{16}$ of its ounce.— and for gold, it has its *caſtillan*, or $\frac{1}{100}$ of a pound.— Its *tomin*, containing 12 grains, or $\frac{1}{8}$ of a caſtillan.— The ſame are in uſe in the Spaniſh Weſt-Indies.

Portugal has its *arroba*, containing 32 Liſbon *arratels*, or pounds: Savary alſo mentions its *faratelle*, containing two Liſbon pounds: and its *rottoli*, containing about 12 pounds. — And for gold, its *chego*, containing four *carats.*— The ſame are uſed in the Portugueze Eaſt-Indies.

Italy, and particularly Venice, have their *migliaro*, containing four mirres; the *mirre* containing 30 Venice pounds: the *ſaggio*, containing a ſixth part of an ounce.— Genoa has five kinds of *weights*, viz. *large weights*, whereby all merchandizes are weighed at the cuſtom-houſe: *caſh-weights*, for piaſters, and other ſpecies: the *cantara*, or *quintal*, for the coarſeſt commodities: the large balance, for raw ſilks; and the ſmall balance for the finer commodities.— Sicily has its *rottolo*, 32 and a half pounds of Meſſina. *Savar.*

Germany, Flanders, Holland, the Hanſe towns, Sweden, Denmark, Poland, *&c.* have their *ſchippondt*, which at Antwerp and Hamburgh is 300 pounds; at Lubeck, 320; and at Coningſberg, 400 pounds.— In Sweden, the *ſchippondt* for copper is 320 pounds; and the *ſchippondt* for proviſions 400 pounds.— At Riga, and Revel, the *ſchippondt* is 400 pounds; and at Dantzic, 340 pounds; in Norway, 300 pounds; at Amſterdam, 300; containing 20 *lyſpondts*, each weighing 15 pounds. *Id.*

In Muſcovy, they weigh their large commodities by the *bercheroct*, or *berkewits*, containing 400 of their pounds.— They have alſo the *poet*, or *poede*, containing 40 pounds, or $\frac{1}{10}$ of the *bercheroct.* *Id.*

In Turky, at Smirna, *&c.* they uſe the *batman*, or *battemant*, containing ſix occos; the *occo* weighing 3 pounds $\frac{4}{5}$ Engliſh.— They have another *batman* much leſs, conſiſting, as the former, of ſix occos: but the occo only containing 15 ounces Engliſh: 44 occos of the firſt kind, make the Turkiſh *quintal.*— At Cairo, Alexandretta, Aleppo, and Alexandria, they uſe the *rotto*, *rotton*, or *rotoli*. The *rotoli* at Cairo, and other parts of Egypt, is 144 drachms; being ſomewhat over an Engliſh pound.— At Aleppo there are three ſorts of *rottos*; the firſt 720 drachms, making about ſeven pounds Engliſh, and ſerving to weigh cottons, galls, and other large commodities: the ſecond is 624 drachms, uſed for all ſilks but white ones, which are weighed by the third *rotto* of 700 drachms.— At Seyda the *rotto* is 600 drachms.

The other ports of the Levant, not named here, uſe ſome of theſe *weights*; particularly the *occo*, or *ocqua*, the *rottoli*, and *rotto*.

To ſhew the proportion of theſe ſeveral *weights* to one another, we ſhall add a reduction of the divers *pounds* uſed throughout Europe, by which the other *weights* are eſtimated, to one ſtandard pound, *viz.* the pound of Amſterdam, Paris, and Bourdeaux; as calculated with great accuracy by M. Ricard, and publiſhed in the new edition of his excellent *Traite de Commerce*, in 1722.

Proportion of the WEIGHTS *of the chief cities in Europe, or thoſe of Amſterdam.*

An hundred pounds of Amſterdam, are equal to

108 Pounds of Alicant.
105 *lb.* of Antwerp.
120 *lb.* of Archangel, or three poedes.
105 *lb.* of Arſchot.
120 *lb.* of Avignon.
98 *lb.* of Baſil in Switzerland.
100 *lb.* of Bayonne in France.
166 *lb.* of Bergamo.
97 *lb.* of Berg ap zom.
95 *lb.* $\frac{1}{4}$ of Bergen in Norway.
111 *lb.* of Bern.
100 *lb.* of Beſancon.
100 *lb.* of Bilboa.
105 *lb.* of Bois le duc.

151 *lb.* of Bologna.
100 *lb.* of Bourdeaux.
104 *lb.* of Bourg en Breſſe.
103 *lb.* of Bremen.
125 *lb.* of Breſlaw.
105 *lb.* of Bruges.
105 *lb.* of Bruſſels.
105 *lb.* of Cadiz.
105 *lb.* of Cologne.
125 *lb.* of Coningſberg.
107 *lb.* and $\frac{1}{2}$ of Copenhagen.
87 Rottos of Conſtantinople.
113 *lb.* and $\frac{1}{2}$ of Dantzic.
100 *lb.* of Dort.
97 *lb.* of Dublin.
97 *lb.* of Edenburgh.
143 *lb.* of Florence.

An hundred pounds of Amſterdam, are equal to

98 *lb.* of Francfort on the Maine.
105 *lb.* of Gaunt.
89 *lb.* of Geneva.
163 *lb.* of Genoa, *caſh-weight.*
102 *lb.* of Hamburg.
106 *lb.* of Leiden.
105 *lb.* of Leipſic.
105 *lb.* and $\frac{1}{2}$ of Liege.
114 *lb.* of Liſle.
143 *lb.* of Leghorn.
106 *lb.* and $\frac{1}{2}$ of Liſbon.
109 *lb.* of London, *Averdupois weight.*
105 *lb.* of Lovaine.
105 *lb.* of Lubec.
141 *lb.* and $\frac{1}{2}$ of Lucca, *light-weight.*
116 *lb.* of Lyons, *city-weight.*
114 *lb.* of Madrid.
105 *lb.* of Malines.
123 *lb.* and $\frac{1}{2}$ of Marſeilles.
154 *lb.* of Meſſina, *light-weight.*
168 *lb.* of Milan.
120 *lb.* of Montpellier.
125 *Bercherocts* of Muſcovy.
100 *lb.* of Nantes.
106 *lb.* of Nancy.
169 *lb.* of Naples.
98 *lb.* of Nuremberg.
100 *lb.* of Paris.
112 *lb.* and $\frac{1}{2}$ of Revel.
109 *lb.* of Riga.
100 *lb.* of Rochel.
146 *lb.* of Rome.
100 *lb.* of Rotterdam.
96 *lb.* of Rouen, *Vicounty-weight.*
100 *lb.* of S. Malo.
100 *lb.* of S. Sebaſtian.
158 *lb.* and $\frac{1}{2}$ of Saragoſa.
106 *lb.* of Seville.
114 *lb.* of Smirna.
110 *lb.* of Stetin.
81 *lb.* of Stockholm.
118 *lb.* of Tholouſe, and Upper Languedoc.
151 *lb.* of Turin.
158 *lb.* and $\frac{1}{2}$ of Valencia.
182 *lb.* of Venice, *ſmall weight.*

WEIGHTS *uſed in the ſeveral parts of the Eaſt-Indies, China, Perſia*, &c.— The *Chineſe weights* are— The *pice*, for large commodities; it is divided into 100 *catis*, or *cattis*, though ſome ſay into 125: the cati into 16 *taels*, or *tales*; each tael equivalent to 1 $\frac{1}{3}$ of an ounce Engliſh, or the *weight* of one rial and $\frac{1}{12}$, and containing 10 *mas*, or *maſſes*; and each mas 10 *condrins*. So that the Chineſe *pice* amounts to 137 pounds Engliſh Averdupois, and the cati to 1 pound 8 ounces.— The *picol*, for ſilk, containing 66 *catis* and $\frac{3}{4}$: the *bahar*, *bakaire*, or *barr*, containing 300 catis.

Tonquin has all the ſame *weights*, meaſures, &c. as China. Japan has only one *weight*, *viz.* the *catti*; which, however, is different from that of China, as containing 20 *taels*.— At Surat, Agra, and throughout the ſtates of the great mogul, they uſe the *man*, or *maund*, whereof they have two kinds; the *king's man*, or *king's weight*; and the *man* ſimply: the firſt uſed for the weighing of common proviſions, containing 40 *ſeers*, or *ſerres*; and each ſeer a juſt Paris pound. Though Tavernier will have the ſeer near a ſeventh leſs than the Paris pound.— The common *man*, uſed in the weighing of merchandize, conſiſts likewiſe of 40 *ſeers*, but each ſeer is only eſtimated at 12 Paris ounces, or $\frac{3}{4}$ of the other ſeer.

The *man* may be looked on as the common *weight* of the Eaſt-Indies, though under ſome difference of name, or rather of pronunciation; it being called *mao* at Cambaya, and in other places *mein*, and *maun*.— The *ſeer* is properly the Indian pound, and of univerſal uſe: the like may be ſaid of the *bahar*, *tael*, and *catti* abovementioned.

The *weights* of Siam are the *pice*, containing two *ſchans*, or *cattis*; but the Siameſe *catti* is only half the Japoneſe, the latter containing 20 *taels*, and the former only 10: though ſome make the Chineſe catti only 16 taels, and the Siameſe 8. — The *tael* contains 4 *baats*, or *ticals*; each about a Paris ounce: the *baat* 4 *ſclings*, or *mayons*: the *mayon* 2 *fouangs*: the *fouang* 4 *payes*: the *paye* 2 *clams*: the *ſompaye*, half a *fouang*. Savar.

It is to be obſerved, that theſe are the names of their coins, as well as *weights*; ſilver and gold being, there, commodities, ſold, as other things, by their *weights*. See COIN, &c.

In the iſle of Java, and particularly at Bantam, they uſe the *gantan*, which amounts to near three Dutch pounds.— In Golconda, at Viſapour and Goa, they have the *furatelle*, containing 1 pound 14 ounces Engliſh: the *mangalis*, or *mangelin*, for weighing diamonds and precious ſtones; weighing at Goa 5 grains, at Golconda, &c. 5 $\frac{1}{2}$ grains.— They have alſo the *rotolo*, containing 14 $\frac{1}{4}$ ounces Engliſh: the *metricol*, containing the ſixth part of an ounce: the *vall*, for piaſtres and ducats; containing the 73d part of a rial.

In perſia, they uſe two kinds of *batmans*, or *mans*; the one, called *cabi*, or *cheray*, which is the king's *weight*; and the other *batman of Tauris*, from the name of one of the chief cities of Perſia.— The firſt weighs, according to Tavernier, 13 pounds 10 ounces Engliſh; the ſecond, 6 pounds $\frac{3}{4}$. According to Sir J. Chardin, the *king's batman* is 13 pounds 14 ounces, and the *batman of Tauris* 6 pounds $\frac{1}{2}$.— Its diviſions are the *ratel*, or a 16th; the *derhem*, or drachm, which is the 50th; the *meſchal*, which is half the derhem; the *dung*, which is the 6th part of the meſchal; being equivalent to 6 *carat-grains*; and laſtly, the *grain*, which is the 4th part of the dung.— They have alſo the *vakie*, which exceeds, a little, our ounce: the *ſah-cheray*, equal to the 1170th part of the derhem: and the *toman*, uſed to weigh out large payments of money, without telling: its *weight* is that of 50 *abaſſis*. Savar. See TOMAN.

African and American WEIGHTS.— We have little to ſay as to the *weights* of America: the ſeveral European colonies there, making uſe of the *weights* of the ſtates or kingdoms of Europe they belong to. For as to the *aroue* of Peru, which weighs 27 pounds, it is evidently no other than the Spaniſh *arroba*, with a little difference in the name.

As to the *weights* of Africa, there are few places have any, except Egypt and the coaſts of Africa, whoſe *weights* are enumerated among thoſe of the ports of the Levant, &c.

As to the coaſts beyond Cape Verde, *viz.* Guinea, Congo, to Soffola, Mozambica, &c. they have no *weights*; only the Engliſh, French, Dutch, Portugueze, and Danes have introduced their own *weights* in their reſpective ſettlements.

The iſle of Madagaſcar, indeed, has its particular *weights*; but it has none that exceed the drachm, nor are they uſed for any thing but gold and ſilver.— Other commodities they never weigh.

Antient WEIGHTS.

The Roman ounce is the Engliſh averdupoiſe ounce, which they divided into ſeven *denarii*, as well as eight *drachms*; and ſince they reckoned their denarius equal to the Attic drachm, this will make the Attic *weights* one eighth heavier than the correſpondent Roman *weights*. Arbuth.

Note, The Grecians divided their *obolus* into *chalci* and λεπτα. Some, as Diodorus, and Suidas, divided the *obolus* into ſix *chalci*, and every *chalcus* into ſeven λεπτα. Others divided the *obolus* into eight *chalci*, and every *chalcus* into eight λεπτα, or *minuta*.

WEIGHT *of the Air*, is equal to the elaſticity thereof. See AIR, and ELASTICITY.

To find the weight *of a cubit inch of Air.*— Weigh a round glaſs veſſel full of common air, very accurately: exhauſt the air out of it: weigh the exhauſted veſſel, and ſubtract the latter *weight* from the former; the remainder is the *weight* of the air exhauſted.

Find, then, the content of the veſſel by the laws of meaſuring, (ſee SPHERE:) — And the ratio of the remaining air to the primitive air. See AIR-*Pump*.

This done, the bulk of the remaining air is found by the rule of three; which being ſubtracted from the capacity of the veſſel, the remainder will be the bulk of air extracted.— Or, if the air-pump be very tight, and the exhauſtion continued as long as any air is got out, the remaining air will be ſo ſmall, that it may be ſafely neglected, and the content of the veſſel taken for the bulk of the exhauſted air.

Having, therefore, the *weight* and bulk of the whole exhauſted air, the *weight* of one cubic inch is eaſily had by the rule of three.

This method was firſt uſed by Otto Gueric, and afterwards by Burcher de Volder; who gives us the following particulars in his experiment.— 1°. That the *weight* of the glaſs ſpherical veſſel he made uſe of, full of common air, was 7 pounds, 1 ounce, 2 drams, 48 grains; when exhauſted of air, 7 *lb.* 1 *oz.* 1 *dr.* 31 *gr.* and when full of water, 16 *lb.* 12 *oz.* 7 *dr.* 14 *gr.* The *weight* of the air, therefore, was 1 *dr.* 12 *gr.* or 77 *gr.* the *weight* of the water 9 *lb.* 11 *oz.* 5 *dr.* 43 *gr.* or 74743 *gr.* Conſequently, the ratio of the ſpecific gravity between water and air is 74743 : 77 :: $970\frac{53}{77}$: 1.—Now, de Volder having found a cubic foot of water to weigh 64 pounds, by inferring, as 970 is to 1, ſo is 64 pounds to a fourth proportional; which, found by the rule of three, is the weight of a cubic foot of air, *viz.* one ounce, 27 gr. or 507 grains nearly. See AIR.

The *weight* of ſea-water is different in different climates.— Mr. Boyle having furniſhed a learned phyſician, going on a voyage to America, with a hydroſtatical balance, and recommended him to obſerve, from time to time, the difference of *weight* he might meet withal, this account was returned him: That the ſea-water increaſed in *weight* the nearer he came to the line, till he arrived at a certain degree of latitude, as he remembers, about the 30th; beyond which, it retained the ſame ſpecific *weight*, till he came to Barbados. *Philoſoph. Tranſact.* N° 18.

Penny WEIGHT.		PENNY.
Aſſay of WEIGHT.		ASSAY.
Auncel WEIGHTS.		AUNCEL *Weight*.

WELD, or WOLD, a plant uſed by the dyers to give a yellow colour; and for this reaſon called in Latin *luteola*, of *luteus*, yellow. See DYING, and YELLOW.

This plant is ſown in a light ground, in the month of March or September; and is ripe in June, or July.— In hot countries it is frequently dry enough when gathered; but in the colder, care muſt be taken to dry it.— Great circumſpection is to be uſed, that it be not gathered before thorough ripe; as alſo, to prevent its getting wet when gathered.

Weld is much cultivated in Kent, for the uſe of the London dyers.— With the help of pot-aſhes, it yields a deep lemon colour; but either by the ſmalneſs of the proportion put into the liquor, or by taking from it a ſlighter tincture, it ſerves to dye all colours between white and a deep yellow.— Its dye will hold well, except againſt urine and tartarous liquors.

WELD, or WEALD, in a chorographical ſenſe. See WEALD.

WELDING *Heat*, a degree of heat which ſmiths give their iron in the forge, when there is occaſion to double up the iron, and to *weld* a work in the doublings; ſo that the iron ſhould grow into a lump thick enough for the purpoſe. See IRON, FORGING, &c.

It is alſo uſed when two bars of iron are to be joined together at the ends to make a length.

WELL, a hole dug under ground, below the level or ſurface of the water collected in the ſtrata. See STRATA, and WATER.

It is uſually of a cylindrical figure, walled with ſtone, and lined with mortar. See SPRING.

M. Blondel informs the royal academy of ſciences of a device they uſe in the lower Auſtria, which is incompaſſed with the mountains of Stiria, to fill their *wells* with water, *viz.* That they dig in the earth to the depth of 20 or 25 feet, till they come to a clammy earth, which they bore through, till the waters break forcibly out: which water, in all probability, comes from the neighbouring mountains, in ſubterraneous channels.— Caſſini obſerves, that in many places of Modena, and Bologna, they make themſelves *wells* by the ſame artifice.— Mr. Derham adds, that the like has been ſometimes found in England, particularly in Eſſex.

In the *Philoſophical Tranſactions*, we are informed by Mr. Norwood, that in Bermudas, *wells* of freſh water are dug within twenty yards of the ſea, and even leſs, which ariſe and fall with the tides as the ſea itſelf does.— He adds, that in digging *wells* in that iſland, they dig till they come almoſt to a level with the ſurface of the ſea; and then they certainly find either freſh water or ſalt: if it prove freſh, yet by digging two or three feet deeper, they always come at ſalt-water. If it be ſandy ground, they uſually find freſh water; but if hard lime-ſtone rock, the water is ſalt or brackiſh. See FRESH *Water*, &c.

In the dioceſe of Paderborn in Weſtphalia, is a *well* which loſes itſelf twice in 24 hours; returning always, after ſix hours abſence, with great noiſe, and ſo forcibly, as to drive three mills not far off.— The inhabitants call it the *bolderbourn*, *q. d.* the boiſterous ſpring.— *Lay-well*, near Torbay, ebbs and flows very often every hour; though ſomewhat oftener in winter than in ſummer. Dr. Oliver obſerves, its flux and reflux ſometimes return every minute, though ſometimes not above 26, or 20 times in an hour. *Philoſoph. Tranſact.* N° 104. See TIDES.

WELL-*Water*. See the article WATER.

WELL, in the military art, denotes a depth which the miner ſinks into the ground, from which he runs out branches or galleries, either to prepare a mine, or find out, and diſappoint the enemy's mine. See MINE, SAP, &c.

WELL-HOLE, in building, is the hole left in a floor, for the ſtairs to come up through. See STAIRS.

WEN, a tumor, or excreſcence, growing on divers parts of the body; conſiſting of a cyſtis, or bag, filled with ſome peculiar matter. See TUMOR, and EXCRESCENCE.

Of this, phyſicians uſually reckon three kinds, according to the matter it is formed of, *i. e.* the humour contained therein.— If ſoft, reſembling a pulp, the *wen* is called *atheroma*; if honey, *meliceris*; and if ſuet, *ſteatoma*. See ATHEROMA, MELICERIS, and STEATOMA.

M. Littre, in *Mem. de l' Acad. des Sciences*, adds a fourth kind, which he calls *lipoma*; by reaſon, the *wen* is formed of ſoft fat.

Wens are all, uſually, of the like colour with the reſt of the body; begin from very little, and grow gradually. They are not dangerous, but frequently laſt a long while. Sometimes they degenerate into abſceſſes.— The cure is, to cut off the cyſtis by the root, which is always narrow.

In the *Philoſophical Tranſactions*, we have an account of a very extraordinary *wen*, on the lower jaw of one Alexander Palmar, of Keith in Scotland.— It was 27 years a growing: at length its enormous bulk, and the pain it gave him, together with its emaciating him exceedingly, determined him to have it cut off.— Dr. Bowers aſſures us, its baſis was five inches over, which ſhould ſeem too large for the whole face, and that, with blood and all, it weighed one or two and twenty pounds.— Its form was ſpheroidal; and when meaſured, was 34 inches about, one way, and 28 another.— It ſeemed to be an atheroma, being a glandulous ſubſtance, with ſeveral big blood-veſſels in it, and hair growing on it. It was as ſenſible as any other part.— The hæmorrhage, after cutting it off, was ſtopped by the vitriolic powder, and the ordinary dreſſing being uſed, a cure was compleated in ſix weeks time.

WENS *of pearl.* See the article PEARL.

WERE, WERA, in our old law-books, ſignifies as much as *æſtimatio capitis*, or *pretium hominis*; that is, ſo much as was antiently paid for killing a man. See ÆSTIMATIO *Capitis*, HINDENI, &c.

When ſuch crimes were puniſhed with pecuniary mulcts, not death; the price was ſet on every man's head, according to his condition and quality.— *Were ſuum*, id eſt, *pretium ſuæ redemptionis*, his ranſom. See RANSOM.

WERELADA, among our Saxon anceſtors, the denying a homicide on oath, in order to be quit of the fine, or forfeiture called *were*. See WERE.

Where a man was ſlain, the price at which he was valued was to be paid to the king and his relations. For in the time of the Saxons, the killing a man was not puniſhed by death, but by a pecuniary mulct, called *wera*. See WERGILD.

If the party denied the fact, he was to purge himſelf by the oaths of ſeveral perſons, according to his degree and quality. — If the guilt amounted to four pounds, he was to have eighteen jurors on his father's ſide, and four on his mothers: if to fourteen pounds, he was to have ſixty jurors. And this was called *werelada*.— *Homicidium* werâ *ſolvatur aut* wereladâ *negetur*.

WERGILD, WEREGELD, in our antient cuſtoms, the price of a man's head: *pretium ſeu valor hominis occiſi, homi-*

cidii pretium; which was paid partly to the king for the loſs of his ſubject, partly to the lord whoſe vaſſal he was; and partly to the next of kin. See WERE.

The *wergeld* of an archbiſhop, and of an earl, was 15000 thrimſa's. Selden's *Titles of Honour*.— That of a biſhop, or alderman, 8000; that of a general, or governour, 4000; that of a prieſt, or thane, 2000; that of a king, 30000; half to be paid to his kindred, and the other half to the nation.

WEST, *Occidens*, *Occaſus*, in coſmography, one of the cardinal points of the horizon; diametrically oppoſite to the eaſt. See CARDINAL *Point*, EAST, *&c.*

Weſt is ſtrictly defined, the interſection of the prime vertical with the horizon, on that ſide the ſun ſets in. See SETTING.— *To draw a true* weſt-*line*. See MERIDIAN.

WEST, in aſtronomy, is chiefly uſed for the place in, or towards which the ſun or ſtars ſink under the horizon.— Thus, we ſay, the Sun, Mars, *&c.* are in the *weſt*.

The point the ſun ſets in, when in the equator, is particularly called the *equinoctial weſt*, or *point of true weſt*. See EQUINOCTIAL.

WEST, and WESTERN, in geography, are applied to certain countries, *&c.* ſituate towards the point of ſun-ſetting with reſpect to certain others.

Thus, the empire of Rome, antiently, and of Germany, at preſent, is called the *empire of the weſt*, or *weſtern empire*; in oppoſition to that of Conſtantinople, which is called the *empire of the eaſt*. See EMPIRE.

The Latin or Roman church, is called the *weſtern church*; in oppoſition to the Greek church. See CHURCH, GREEK, &c.

The French, Spaniards, Italians, *&c.* are called *weſtern nations*, in reſpect to the Aſiatics; and America, the *Weſt-Indies*, in reſpect of the Eaſt-Indies.

WEST-WIND, is alſo called *zephyrus*, and *favonius*. See WIND.

WEST-SAXONLAGE, or the law of the Weſt-Saxons. See LAW.

WEST-*India Companies.*	See the article	COMPANY.
WEST *Dial.*		DIAL.
Mooring for WEST.		MOORING.
WESTERN *Amplitude.*		AMPLITUDE.
WESTERN *Church.*		CHURCH.
WESTERN *Horizon.*		HORIZON.
WESTERN *Ocean.*		OCEAN.

WESTPHALIA-*Ham*. See the article HAM.

WET-GLOVER, a dreſſer of the ſkins of ſheep, lambs, goats, *&c.* which are ſlender, thin, and gentle. See GLOVE, SKIN, &c.

WET *Dock*. See the article DOCK.

WEY. See the article WEIGH.

WHALE, in aſtronomy, one of the conſtellations. See CETUS.

WHALE-*Bone*, a commodity procured from the *whale*, uſed as ſtiffening in ſtays, fans, buſks, ſkreens, *&c.*

There are many kinds of *whales*; but two principal; one, retaining that name, the other called *cachalot*.— The difference conſiſts in this, that the cachalot has teeth, and the *whale* properly ſo called, inſtead of teeth, has a kind of whiſkers in his throat, about a ſpan broad, and 15 feet long, ending in a ſort of fringe, much like ſwine's briſtles.

They are ſet in the palate, and do, in ſome meaſure, the office of teeth. – Theſe whiſkers, ſplit and faſhioned, are what we call *whalebone*. — The pizzle, or genital member of the animal, ſerves likewiſe for the ſame purpoſe.

WHALE-*Fins*. See the article FIN.

WHALE-*Fiſhery*. See the article FISHERY.

WHARF, a ſpace on the banks of a haven, creek, or hithe; provided for the convenient loading and unloading of veſſels upon. See HAVEN, HITHE, &c.

The fee paid for the landing of goods on a *wharf*, or for ſhipping them off, is called *wharfage*. And the perſon who has the overſight and direction of the *wharf*, receives *wharfage*, &c. is called the *wharfinger*. See KEY.

WHARLES *of flowers*, among herbaliſts, are rows of leſſer flowers, ſet at certain diſtances about the main ſtalk or ſpike. See FLOWER.

WHEAT, *Triticum*. See the article CORN.

WHEEL, *Rota*, in mechanics, a ſimple machine conſiſting of a round piece of wood, metal, or other matter; which revolves on an axis. See AXIS.

The *wheel* is one of the principal mechanic powers.— It has places in moſt engines; in effect, it is of an aſſemblage of *wheels*, that moſt of our chief engines are compoſed.— Witneſs clocks, mills, *&c.* See CLOCK, MILL, &c.

Its form is various, according to the motions it is to have; and the uſe it is to anſwer.— By this it is diſtinguiſhed into *ſimple*, and *dented*.

Simple WHEELS, are thoſe whoſe circumference and axis is uniform, and which are uſed ſingly, and not combined.— Such are the *wheels* of carriages; which are to have a double motion; the one circular about their axis; the other rectilinear; by which they advance along the road, *&c.* which two motions they appear to have; though, in effect, they have but one: it being impoſſible the ſame thing ſhould move, or be agitated two different ways at the ſame time.

This one is a ſpiral motion; as is eaſily ſeen, by fixing a piece of chalk on the face of a *wheel*, ſo as it may draw a line on a wall, as the *wheel* moves.— The line it here traces is a juſt ſpiral, and ſtill the more curve, as the chalk is fixed nearer the axis.— For a very nice phænomenon, in the motion of theſe *wheels*, ſee ROTA *Ariſtotelica*.

We ſhall add, that in *wheels* of this kind, the heighth ſhould always be proportioned to the ſtature of the animal that draws or moves them.— The rule is, that the load, and the axis of the *wheels* be of the ſame heighth with the power that moves them: otherwiſe, the axis being higher than the beaſt, part of the load will lie on him; or, if it be lower, he pulls to diſadvantage, and muſt exert a greater force. Though Stevinus, Dr. Wallis, *&c.* ſhew, that to draw a vehicle, *&c.* over waſte, uneven places, it were beſt to fix the traces to the *wheels* lower than the horſes breaſt.

The power of theſe *wheels* reſults from the difference of the radii of the axis, and circumference.— The canon is this: "As the radius of the axis is to that of the circumference, "ſo is any power, to the weight it can ſuſtain hereby."

This is alſo the rule in the axis in the peritrochio; and, in effect, the *wheel*, and the axis in peritrochio, are the ſame thing; only, in theory, it is uſually called by the latter name, and in practice, by the former. See AXIS *in Peritrochio*.

Dented WHEELS, are thoſe either whoſe circumference, or axis, is cut into teeth, by which they are capable of moving and acting on one another, and of being combined together.

The uſe of theſe is very conſpicuous in clocks, jacks, *&c.* See CLOCKWORK, WATCHWORK, &c.

The power of the *dented wheel* depends on the ſame principle, as that of the ſimple one.— It is only that to the ſimple axis in peritrochio, which a compound lever is to a ſimple lever. See LEVER, and AXIS.

Its doctrine is compriſed in the following canon, *viz.*— "The ratio of the power to the weight," in order for that to be equivalent to this, "muſt be compounded of the ratios of the diameter of the axis of the laſt *wheel* to the diameter of the firſt; and of the ratio of the number of "revolutions of the laſt *wheel*, to thoſe of the firſt, in the "ſame time.— But this doctrine will deſerve a more particular explication."

1°. Then, if the weight be multiplied into the product of the radii of the axis, and that product be divided by the product of the radii of the *wheels*, the power required to ſuſtain the weight will be found.— Suppoſe, *e. gr.* the weight A, (*Tab. Mechanics*, *fig.* 63.) = 6000 pounds, BC = 6 inches, CD = 34 inches, EF = 5 inches, EG = 35 inches, HI = 4 inches, HK = 27 inches. Then will BC, EF, HI = 120; and CD, EG, IK = 32130. Hence the power, required to ſuſtain the weight, will be 6000. 120 : 32130 = $22\frac{1}{3}$ very nearly; a ſmall addition to which will raiſe it.

2°. If the power be multiplied into the product of the radii of the *wheels*, and the factum be divided by the product of the radii of the axis; the quotient will be the weight, which the power is able to ſuſtain.— Thus, if the power be $22\frac{1}{3}$ of a pound, the weight will be 6000 pounds.

3°. "A power and a weight being given, to find the num-"ber of *wheels*, and in each *wheel*, ſo, as that the radius of "the axis, to the radius of the *wheel*: ſo, as that the pow-"er being applied perpendicularly to the periphery of the "laſt *wheel*, may ſuſtain the given weight."

Divide the weight by the power: reſolve the quotient into the factors which produce it.— Then will the number of factors, be the number of *wheels*; and the radii of the axes will be to the radii of the *wheels*, as unity to the ſeveral *wheels*.— Suppoſe, *e. gr.* a weight of 3000 pounds, and a power of 60, is 500, which reſolves into theſe factors, 4.5.5.5. Four *wheels* are to be made, in one of which, the radius of the axis is to be the radius of the *wheel*, as 1 to 4.— In the reſt, as 1 to 5.

4°. If a power move a weight by means of two *wheels*, the revolutions of the ſlower *wheel*, are to thoſe of the ſwifter, as the periphery of the ſwifter axis, is to the periphery of the *wheel* that catches on it.

Hence, 1°. the revolutions are as the radius of the axis FE, to the radius of the *wheel* DC.— 2°. Since the number of teeth in the axis FD, is to the number of teeth in the circumference of the *wheel* M, as the circumference of that, to the circumference of this: the revolutions of the ſlower *wheel* M, are to the revolutions of the ſwifter N, as the number of teeth in the axis, to the number of teeth in the *wheel* M it catches into.

5°. If the factum of the radii of the *wheels* GD, DC be multiplied into the number of revolutions of the ſloweſt *wheel* M; and the product be divided by the factum of the radii of the axes which catch into them, GH, DE, &c. the quotient will be the number of revolutions of the ſwifteſt *wheel*

wheel O. *E. gr.* If $GE=8$, $DC=12$, $GH=4$, $DE=3$, and the revolution of the *wheel* M be one; the number of revolutions of the *wheel* O will be 8.

6°. If a power move a weight by means of divers *wheels*, the ſpace paſſed over by the weight, is to the ſpace of the power, as the power to the weight.— Hence, the greater the power, the faſter is the weight moved; and vice verſa.

7°. The ſpaces paſſed over by the weight and the power, are in a ratio compounded of the revolutions of the ſloweſt *wheel*, to the revolutions of the ſwifteſt; and of the periphery of the axis of that, to the periphery of this.— Hence, ſince the ſpace of the weight and the power are reciprocally as the ſuſtaining power to the weight; the power that ſuſtains a weight, will be to the weight, in a ratio compounded of the revolutions of the ſloweſt *wheel*, to thoſe of the ſwifteſt, and of the periphery of the axis of that, to the periphery of this.

8°. "The periphery of the axis of the ſloweſt *wheel*, with "the periphery of the ſwifteſt *wheel*, given; as alſo, the "ratio of the revolutions of the one, to thoſe of the other: "to find the ſpace which the power is to paſs over, while "the weight goes any given length."

Multiply the periphery of the axis of the ſloweſt *wheel*, into the antecedent term of the ratio, and the periphery of the ſwifteſt *wheel*, into the conſequent term; and to theſe two products, and the given ſpace of the weight, find a fourth proportional: this will be the ſpace of the power.— Suppoſe, *e. gr.* the ratio of the revolutions of the ſloweſt *wheel*, to thoſe of the ſwifteſt, to be as 2 to 7; and the ſpace of the weight 30 feet: and let the periphery of the axis of the ſloweſt *wheel*, be to that of the ſwifteſt, as 3 to 8. The ſpace of the power will be found 280.

9°. "The ratio of the peripheries of the ſwifteſt *wheel*, and "of the axis of the ſloweſt; together with the ratio of their "revolutions, and the weight, being given: to find the power "able to ſuſtain it."

Multiply both the antecedents, and the conſequents of the given ratios into each other: and to the product of the antecedents, the product of the conſequents, and the given weight, find a fourth proportional: that will be the power required. — Suppoſe, *e. gr.* the ratio of the peripheries 8 : 3. That of the revolutions 7 : 2; and the weight 2000: the power will be found $214\frac{2}{7}$.— After the ſame manner may the weight be found; the power and the ratio of the peripheries, *&c.* being given.

10°. "The revolutions the ſwifteſt *wheel* is to perform, "while the ſloweſt makes one revolution, being given; to"gether with the ſpace the weight is to be raiſed, and the "periphery of the ſloweſt *wheel*; to find the time that will "be ſpent in raiſing it."

Say, as the periphery of the axis of the ſloweſt *wheel* is to the ſpace of the weight given; ſo is the given number of revolutions of the ſwifteſt *wheel*, to a fourth proportional; which will be the number of revolutions, performed while the weight reaches the given heighth.— Then, by experiment, determine the number of revolutions the ſwifteſt *wheel* performs in an hour; and, by this, divide the fourth proportional found before.— The quotient will be the time ſpent in raiſing the weight.

WHEELS *of a clock*, &c. are the crown *wheel*, contrat *wheel*, great *wheel*, ſecond *wheel*, third *wheel*, ſtriking *wheel*, detent *wheel*, &c. See CLOCK, and WATCH.

WHEELS *of coaches, waggons*, &c.— In the *Philoſophical Tranſactions*, we have ſome experiments, ſhewing the advantages of high *wheels* in carriages of all kinds: the reſults of the experiments amount to this:

1°. That, four *wheels* of $5\frac{2}{3}$ inches high, *viz.* one half of the ordinary heighth of the *wheels of a* waggon, draw a weight of $50\frac{1}{2}$ *lb.* averdupoiſe up an inclined plane, with leſs power by ſix ounces, than two of them matched with two ſmaller ones of $4\frac{1}{3}$ inches heighth.

2°. That any vehicle might be much more eaſily drawn in rough ways, if the fore *wheels* were as high as the hind *wheels*, and the thills fixed under the axis.

3°. That ſuch a vehicle would likewiſe be drawn more eaſily where the *wheels* cut in clay, ſand, *&c.*

4°. That high *wheels* would not cut ſo deep as low *wheels*.

5°. That low *wheels* are indeed beſt for turning in a narrow compaſs.

Potter's **WHEEL**. See the article POTTERY.

Ariſtotle's **WHEEL**.	See the article	ROTA *Ariſtotelica*.
Meaſuring **WHEEL**.		PERAMBULATOR.
Perſian **WHEEL**.		PERSIAN.
Water **WHEEL**.		WATER.

WHEEL is alſo the name of a kind of puniſhment, which great criminals are put to in divers countries. See PUNISHMENT.

In France, their aſſaſſins, parricides, and robbers on the highway, are condemned to the *wheel*, *i. e.* to have their bones firſt broke with an iron bar on a ſcaffold, then to be expoſed, and left to expire on the circumference of a *wheel*.— In Germany, they break their bones on the *wheel* itſelf.

This cruel puniſhment was unknown to the antients; as is obſerved by Cujas.— It is not certain who was the inventor. — Its firſt introduction was in Germany. It was but rarely practiſed any where elſe, till the time of Francis I. of France; who, by an edict of the year 1534, appointed it to be inflicted on robbers on the highway. Richelet dates the edict in the year 1538, and quotes Brodæus, *Miſcell.* L. II. c. 10.

WHEEL, in the military art, is the word of command, when a battalion or ſquadron is to alter its front, either one way or the other. See EVOLUTION, QUARTER-*Wheeling*, &c.

To wheel to the right, the man in the right angle is to turn very ſlowly, and every one to *wheel* from the left to the right, regarding him as their centre: and vice verſa, when they are to *wheel to the left*.

When a diviſion of men are on the march, if the word be *wheel to the right*, or *to the left*, then the right or left-hand man keeps his ground, turning only on his heel, and the reſt of the rank move about quick, till they make an even line with the ſaid right or left-hand man.

Squadrons of horſe *wheel* much after the ſame manner.

WHEEL-*Barometer*. See the article BAROMETER.

WHEEL-*Fire*, among chymiſts, a fire uſed for fuſing of metals; properly called *ignis rotæ*. See FUSION, METAL, &c.

It is a fire which covers or incompaſſes the crucible, coppel, or melting-pot quite over; a-top, as well as around the ſides. See FIRE.

WHERLICOTES, a ſort of open chariots, of the antient Britons invention, uſed by perſons of quality, before the invention of coaches. See COACH, CARR, &c.

WHERRY. See the articles VESSEL, BOAT, &c.

WHETSTONE, *Cos*, a ſort of ſtone of a lax compoſition, and coarſe grain; ſerving for the whetting or ſharpening knives, and other tools upon. See STONE, and HONE.

WHEY, the ſerum or watery part of milk. See MILK, and SERUM.

WHIFFLER, of a company in London, a young freeman, who goes before, and waits on the company on occaſions of public ſolemnity. See COMPANY.

WHIGS, a party or faction in England, oppoſite to the *tories*. See FACTION, TORY, &c.

The origin of the names of theſe two mighty factions is very obſcure.— If ſome little trivial circumſtance, or adventure which eſcapes the knowledge of mankind, give the name to a party, which afterwards becomes famous, poſterity labours in vain to find the original of ſuch names: it ſearches the ſources, forms conjectures, invents reaſons, and ſometimes meets the truth, but always without knowing it aſſuredly.

Thus, in France, the Calviniſts are called *Huguenots*; yet no body was ever able certainly to aſſign the cauſe of that appellation. See HUGUENOT.

Whig is a Scotiſh, and ſome ſay, too, an Iriſh word, literally ſignifying *whey*.— *Tory* is another Iriſh word, ſignifying a *robber*, or *highwayman*.

Now, under the reign of king Charles the ſecond, while his brother, then duke of York, was obliged to retire into Scotland, there were two parties formed in that country.— That of the duke, which was ſtrongeſt, perſecuted the other, and frequently reduced them to fly into the mountains and woods, where thoſe unhappy fugitives had often no other ſubſiſtence for a long time, but cows milk.— Hence, their adverſaries they called *tories*, *q. d.* robbers; and the tories upbraiding them with their unhappineſs, from the milk whereof they lived, called them *whigs*.— From Scotland the two names came over with the duke into England.

Others give the origin and etymology of the two words thus: — During the unhappy war which brought king Charles I. to the ſcaffold, the partizans of that prince were at firſt called *cavaliers*; and thoſe of the parliament, *round-heads*.— Now, *tory* was a name for a kind of banditti in Ireland, who ſheltered themſelves in the mountains, and the iſlands formed by the bogs; as, then, the king's enemies charged him with favouring the rebellion in Ireland, which broke out at that time, they changed the name *cavalier* into that of *tory*.— And theſe laſt, to be even with their enemies, who were ſtrictly leagued with the Scots, changed *round-heads* for *whigs*, the name of a ſort of enthuſiaſts in Scotland, who living in the open fields and woods, fed much on milk.— *Diſſert. de M. Rapin Thoyras ſur les* wighs *&* *les* torys. *Haye An.* 1717.

WHINE, a hunting term, uſed in reſpect of the cry of an otter. See HUNTING.

WHIP, or **WHIP-STAFF**, in a ſhip, a piece of timber in form of a ſtrong ſtaff, faſtened into the helm, for the ſteersman, in ſmall ſhips, to hold in his hand; thereby to move the rudder, and direct the ſhip.— See *Tab. Ship. fig.* 2. *n.* 103; ſee alſo the articles HELM, and STEERING.

WHIP-*Grafting*.	See the article	ENGRAFTING.
WHIP-*Saw*.		*Whip*-SAW.

WHIPPER. See FISHING.

WHIPPING, a term uſed by anglers, when they faſten a line to the hook, or rod. See ANGLING.

The word is alſo taken for the caſting in of the hook, and drawing it gently on the water.

WHIPT *Syllabub.* See the article SYLLABUB.

WHIRL-POOL, an eddy, vortex, or gulph, where the water is continually turning round. See GULPH, EDDY, VORTEX, &c.

WHIRL-WIND, a wind that riſes ſuddenly, is exceedingly rapid, and impetuous, when riſen, but ſoon ſpent. See WIND, and HURRICANE.

There are divers ſorts of *whirl-winds*, diſtinguiſhed by their peculiar names; as the *preſter*, *typho*, *turbo*, *exhydria*, and *ecnephias*.

The *preſter* is a violent wind, breaking forth with flaſhes of lightning.— This is rarely obſerved; ſcarce ever without the *ecnephias*.— Seneca ſays, it is a *typho*, or *turbo* kindled or ignited in the air. See PRESTER.

The *ecnephias* is a ſudden and impetuous wind, breaking out of ſome cloud; frequent in the Æthiopic ſea, particularly about the Cape of Good Hope.— The ſeamen call them *travados*.

The *exhydria* is a wind burſting out of a cloud, with a great quantity of water.—This only ſeems to differ in degree from the *ecnephias*, which is frequently attended with ſhowers.

A *typho*, or *vortex*, moſt properly called a *whirl-wind*, or *hurricane*, is an impetuous wind, turning rapidly every way, and ſweeping all round the place.— It frequently deſcends from on high.— The Indians call it *orancan*, the Turks, *&c.* *oliphant*.— It is frequent in the eaſtern ocean, chiefly about Siam, China, *&c.* and renders the navigation of thoſe parts exceeding dangerous. See VORTEX, HURRICANE, SPOUT, &c.

WHISPERING. See HEARING, ATTENTION, &c.

WHISPERING-*Places* depend on this principle, that the voice being applied to one end of an arch, eaſily rolls to the other. See SOUND, ARCH, &c.

Accordingly, all the contrivance in a *whiſpering-place* is, that near the perſon who whiſpers there be a ſmooth wall, arched either cylindrically, or elliptically.— A circular arch will do, but not ſo well. See PHONICS.

Places famed for the conveyance of *whiſpers*, are the priſon of Dionyſius at Syracuſe, which increaſed a ſoft *whiſper* to a noiſe, the clap of one's hand to the ſound of a cannon, *&c.* — The aquæducts of Claudius, which carried a voice ſixteen miles; and divers others, enumerated by Kircher in his *Phonurgia*.

The moſt conſiderable in England, are, the dome of S. Paul's, London, where the ticking of a watch may be heard from ſide to ſide; and a very eaſy *whiſper* be ſent all round the dome.— This, Mr. Derham found to hold not only in the gallery below, but above upon the ſcaffold, where a *whiſper* would be carried over one's head round the top of the arch, though there be a large opening in the middle of it into the upper part of the dome.

The famous *whiſpering-place* in Glouceſter cathedral, is no other than a gallery above the eaſt end of the choir, leading from one ſide thereof to the other.— It conſiſts of five angles, and ſix ſides, the middlemoſt of which is a naked window; yet two *whiſperers* hear each other at the diſtance of twenty-five yards.

WHITE, one of the colours of natural bodies. See COLOUR.

White is not ſo properly ſaid to be any one colour, as a compoſition of all the colours; it being demonſtrated by Sir Iſaac Newton, that thoſe bodies only appear *white*, which reflect all the kinds of coloured rays alike. See WHITENESS.

Hevelius affirms it as a thing moſt certain, that in the northern countries, animals, as hares, foxes, bears, *&c.* become *white* in the winter-time; and in ſummer reſume their natural colours. See HAIR.

Black bodies are found to take heat ſooner than *white* ones; by reaſon the former abſorb or imbibe rays of all kinds and colours, and the latter reflect all. See BLACKNESS.

Thus, black paper is ſooner put into flame by a burning-glaſs, than *white*; and black clothes hung up by the dyers in the ſun, dry ſooner than *white* ones. See HEAT.

WHITE *Arſenic.*	See the article	ARSENIC.
WHITE *Aſhes.*		ASHES.
WHITE *Cinnamon.*		CINNAMON.
WHITE *Copperas.*		COPPERAS.
WHITE *Cordage.*		CORDAGE.
WHITE *Diachylon.*		DIACHYLON.
WHITE *Eagle.*		EAGLE.

WHITE *of the Eye*, denotes the firſt tunic or coat of the eye, called *albuginea*, and *conjunctiva*, becauſe ſerving to bind together, or incloſe the reſt. See CONJUNCTIVA, &c.

WHITE *Flag.*	See the article	FLAG.
WHITE *Froſt.*		FROST.

WHITE-*Friars*, a name common to ſeveral orders of monks, from their being clothed in a *white* habit. See MONK, HABIT, &c.

Such are the regular canons of S. Auguſtin, the Premonſtratenſes, and Bernardins. See AUGUSTIN, PREMONSTRATENSES, &c.

WHITE *Glaſs.* See the article GLASS.

WHITE-*hart Silver*, *candidi cervi Argentum*, a tribute or mulct paid into the exchequer, out of certain lands in or near the foreſt of *White-hart* in *Dorſetſhire*; which has continued from Henry the third's time, who firſt impoſed it upon Thomas de la Linde, and others, for killing a beautiful *white* hart, which that king had purpoſely ſpared in hunting.

WHITE *Hellebore.* See the article HELLEBORE.

WHITE *Lead*, is a ſort of ruſt of lead; or lead diſſolved with vinegar; much uſed by the painters. See LEAD.

It is prepared two ways:— either by reducing the lead into thin laminæ, ſteeping them in ſtrong vinegar, and every ten days ſcraping off the ruſt formed on the ſurface; and repeating this till the lead be quite conſumed.

Or, by rolling the laminæ into cylinders like ſheets of paper, only ſo as that there be a little ſpace left between the ſeveral folds or turns.— Theſe laminæ they ſuſpend in the middle of earthen pots, at the bottom of which is vinegar.— The pots being well cloſed, are buried in a dunghil for thirty days; after which, being opened, the lead is found, as it were, calcined, and reduced into what they call *ceruſſe*, or *white lead*, to be broke into pieces, and dried in the ſun.

It is uſed both in painting in oil and in water-colours, and makes a good colour in each.— But it is ſomewhat dangerous both in the grinding and uſing it, as being a rank poiſon. See COLOUR.

Of this *white lead* it is that the paint uſed by the ladies, called *ceruſs*, is made. See CERUSS.

WHITE *Line*, among printers, a void ſpace greater than uſual, left between two lines. See PRINTING.

WHITE *Line*, in anatomy. See the article LINEA *Alba*.

WHITE *Linen*, is cloth of hemp, or flax, bleached by divers lyes, and waterings on the ground. See BLEACHING.

WHITE *Meats*, include milk, butter, cheeſe, white-pots, cuſtards, and other foods coming of milk, or eggs. See MILK, FOOD, &c.

WHITE *Money*, *Libra albæ*. See the article MONEY.

WHITE *Mortar.*	See the article	MORTAR.
WHITE *Order.*		ORDER.

WHITE *Paper*, is that intended for writing, printing, *&c.* in contradiſtinction to *brown paper*, *marbled paper*, *blotting paper*, &c. See PAPER.

WHITE *Pepper*, is black pepper blanched, or whitened, by ſhelling off its upper ſkin. See PEPPER.

WHITE-*Pot*, denotes milk or cream baked with the yolks of eggs, fine bread, ſugar, and ſpice, in an earthen pot.

The cooks furniſh us with a variety of diſhes under this form and denomination, *Norfolk white-pot*, *Weſtminſter white-pot*, *rice white-pot*, &c.

WHITE *Precipitate.* See the article MERCURY.

WHITE *Rent*, a rent or duty of 8 *d.* payable yearly, by every tinner in the county of Devon, to the duke of Cornwall. See QUIT *Rent*.

WHITE *Salt*, is common, or ſea-ſalt, dried and calcined by the fire, ſo as not to leave any moiſture therein.— The chymiſts call it *decrepitated ſalt*.

There are ſome ſalts naturally *white*; and others that need to be *whitened*, either by diſſolving and purifying them in fair water, which is afterwards evaporated; or by means of fire; or by the ſun. See SALT.

WHITE *Sauce*, a ſort of ſauce made of blanched almonds, and the breaſt of a capon, pounded together with cloves, cinnamon, *&c.*— We alſo hear of *white broth*, being a ſort of broth enriched with ſack, and ſpices, having blanched almonds ſcraped into it, and the whole thickened with the yolks of eggs, *&c.*

WHITE *Soap.* See the article SOAP.

Spaniſh **WHITE**, is a kind of fucus uſed by the ladies to *whiten* the complexion, and hide the defects thereof.— It is made of tin-glaſs diſſolved in ſpirit of nitre, and precipitated into a very fine powder, by means of ſalt-water. See BISMUTH, &c.

WHITE *Spurs.*	See the article	ESQUIRE.
WHITE *Star.*		STAR.
WHITE *Sugar.*		SUGAR.
WHITE *Tartar.*		TARTAR.
WHITE *Varniſh.*		VARNISH.
WHITE *Vitriol.*		VITRIOL.

WHITE *Wax*, is yellow wax blanched, and purified by the ſun and dew. See WAX.

WHITE *Wine*, is that of a clear, bright, tranſparent colour, bordering on *white*.— It is thus called, to diſtinguiſh it from the red wines, or clarets.

The generality of *white wines* are made from white grapes; though there are ſome from black ones. See WINE.

WHITENESS, *Albedo*, the quality which denominates a body *white*. See WHITE, and COLOUR.

Sir Iſaac Newton ſhews, that *whiteneſs* conſiſts in a mixture of all the colours; and that the light of the ſun is only *white*, becauſe conſiſting of all colours. See RAY.

From the multitude of rings of colours, which appear upon compreſſing two priſms, or object-glaſſes of teleſcopes together, it is manifeſt, that theſe do ſo interfere and mingle with one another at laſt, as, after eight or nine reflexions, to dilute one another wholly, and conſtitute an even and uniform *whiteneſs*: whence, as well as from other experiments, it appears, that *whiteneſs* is certainly a mixture of all colours; and that the light which conveys it to the eye, is a mixture of rays indued with all thoſe colours. See LIGHT.

The ſame author ſhews, that *whiteneſs*, if it be moſt ſtrong and luminous, is to be reckoned of the firſt order of colours; but if leſs, as a mixture of the colours of ſeveral orders: of the former ſort he reckons white metals; and of the latter, the *whiteneſs* of froth, paper, linen, and moſt other white ſubſtances.— And as the white of the firſt order is the ſtrongeſt that can be made by plates of tranſparent ſubſtances, ſo it ought to be ſtronger in the denſer ſubſtances of metals, than in the rarer ones of air, water, and glaſs.

Gold or copper mixed either by fuſion, or amalgamation, with a very little mercury, with ſilver, tin, or regulus of antimony, becomes white; which ſhews, both that the particles of white metals have much more ſurface, and therefore are ſmaller than thoſe of gold or copper; and alſo, that they are ſo opake, as not to ſuffer the particles of gold or copper to ſhine through them.— And as that author doubts not, but that the colours of gold and copper are of the ſecond or third order, therefore the particles of white metals cannot be much bigger than is requiſite to make them reflect the white of the firſt order. See PARTICLE.

WHITENING.	See the article	BLEACHING.
WHITENING *of Hair.*		HAIR.
WHITENING *of Wax.*		WAX.

WHITES, in medicine. See the article FLUOR *Albus*.

WHITLOW, or WHITLOE, the popular name for what the phyſicians commonly call *panaris*.

WHITSUN *Farthings*. See the article PENTECOSTALS.

WHITSUNTIDE, the fiftieth day after Eaſter. See EASTER, FEAST, &c.

The ſeaſon properly called *Pentecoſt*, is popularly called *Whitſuntide*; ſome ſay, becauſe in the primitive church, thoſe who were newly baptized came to church between Eaſter and Pentecoſt in *white* garments.

Whitſunday always falls between the 9th of May, and the 14th of June, excluſive. See PENTECOST.

WHOLE, *Totum*, in arithmetic, &c. See PART, DIVISION, PARTITION, &c.

WHOLE *Meaſure.*	See the article	MEASURE.
WHOLE *Number.*		NUMBER.
WHOLE *Sine.*		SINE.

WHOODINGS, or HOODINGS, a ſea term, uſed for planks joined and faſtened along the ſhip's ſides into the ſtem.

WHORE. See COURTESAN, HARLOT, CONCUBINE, &c.

WHORLBAT, or HURLBAT, a kind of gauntlet, or leathern ſtrap loaden with plummets; uſed by the antient Romans in their ſolemn games, and exerciſes; and by them called *cæſtus*. See CÆSTUS.

WHUR, in falconry, denotes the fluttering of partridges, or pheaſants, as they riſe.

WIC, denotes a place on the ſea-ſhore, or on the bank of a river— though, in the original Saxon, it more properly ſignifies a *ſtreet*, *village*, or *dwelling-place*; alſo a *caſtle*. See WYKE.

We often meet with *wic* in the Saxon writers, as a termination of the name of a town, which had a compleat name without it:— as, *Lunden-wic*; that is, London town; which ſignifies no more than *London*:— In the Saxon *Annals*, it is mentioned, that king Æthelbert made Mellitus biſhop of *Lunden-wic*.— So, Ipſwich is written in ſome old charters, *villa de Gippo*, and ſometimes *villa de Gippo wico*; which is no variance, but the ſame thing; for *Gipps* is the compleat name, and *Gipp-wic* is Gipps town.

WICKER, a twig of the oſier ſhrub.

WICKET, of the French, *guichet*, a little door within a gate; or a hole in a door, through which to view what paſſes without. See DOOR.

WICKLIFFISTS, or WICKLIFFITES, a religious ſect, who had their riſe in England, and their name from their leader *John Wickliff*, a profeſſor of divinity in the univerſity of Oxford. See LOLLARD.

To that immortal author it is we owe the firſt hint of the great reformation, effected 200 years after him. See REFORMATION.

Wickliff maintained, that the ſubſtance of the ſacramental bread and wine ſtill remained ſuch after conſecration.— He alſo oppoſed the doctrine of purgatory, indulgences, the invocation of ſaints, and the worſhip of images. See TRANSUBSTANTIATION, PURGATORY, &c.

He made an Engliſh verſion of the Bible; and compoſed two large volumes, called *Aletheia*; that is, *truth*; which was the ſource whence John Huſs firſt learned moſt of his doctrines. See HUSSITES.

The archbiſhop of Canterbury called a council againſt *Wickliff*, and he was condemned therein; but the good Reformer ſet the condemnation at nought.— After this, king Richard baniſhed him out of England; but he was afterwards recalled, and died in his own country in the year 1384.

Forty years afterwards, his doctrines, and the adherers thereto, were condemned by the council of Conſtance; in conſequence of which, his bones were dug up, and the council condemned him of forty errors.

WIDOW, *Vidua*, a woman that has loſt her huſband. See WOMAN, WIFF, HUSBAND, &c.

Some alſo uſe the term WIDOWER, for a man who has loſt his wife.— Marriage with a *widow*, is a kind of bigamy in the eye of the canon law. See BIGAMY.

WIDOW *of the King*, was ſhe, who, after her huſband's death, being the king's tenant in capite, was driven to recover her dower by the writ *de Dote Aſſignanda*; and could not marry again without the king's conſent.

WIDOW *Bench*, in the county of Suſſex, is that ſhare which a *widow* is allowed of her huſband's eſtate, beſides her jointure. See BENCH.

WIECK. See the article WEEK.

WIFE, *Uxor*, a married woman; or one joined with, and under the protection of a huſband. See WOMAN, MARRIAGE, and HUSBAND.— See alſo MATRON, &c.

A *wife*, in our Engliſh law, is termed *feme covert*; and, in the judgment of the law, is reputed to have no will, as being ſuppoſed entirely under, and ſubject to that of her huſband: *uxor fulget radiis mariti*. See COVERT, and COVERTURE.

If any goods or chattels be given her, they all immediately become her huſband's.— She cannot let, ſell, give away, or alienate any thing, without her huſband's conſent.— Her very neceſſary apparel is not her's in property.— All her perſonal chattels which ſhe held at her marriage, are ſo much her huſband's, that after his death they ſhall not return to her, but go to the executor, or adminiſtrator of her huſband; except only her paraphernа, or præter-dotalia, being her neceſſary apparel; which, with the conſent of her huſband, ſhe may demiſe by will. See PARAPHERNALIA.

The *wife* can make no contract without her huſband's conſent; and in all law matters, *ſine viro reſpondere non poteſt*.

The law ſuppoſes in the huſband, the full power over his *wife*, as over his child or ſervant; and therefore he muſt anſwer for all her faults, and treſpaſſes.

If a *wife* bring forth a child during her huſband's abſence, though of many years; yet if he lived all the time *inter quatuor maria*, within the iſland, he muſt father the child; and the child, if firſt born, ſhall inherit.

If a *wife* bring forth a child begot by a former huſband, or any other perſon, before marriage, but born after marriage with another man; this latter muſt own the child; and that child ſhall be his heir at law.

The *wife*, after her huſband's death, having no jointure ſettled before marriage, may challenge the third part of his yearly rents of land, during her life; and within the city of London, a third part of all her huſband's moveables for ever.

The *wife* partakers of the honours, and condition of her huſband; but none of the *wife*'s dignities come, by marriage, to her huſband.

Yet, the huſband, for getting his *wife* with child, which muſt appear by its being born alive, ſhall have all his *wife*'s lands for life. See COURTESY.

The Engliſh laws are generally eſteemed by foreigners, as very hard, in reſpect of the women; and yet Chamberlayne is of a very different ſentiment, aſſerting, that the condition of *wives* in England, is better than in any other country.

Tertullian has two books, on the ornaments and attire of *wives*.— In the ſecond he labours to prove, that a Chriſtian *wife* cannot, in conſcience, endeavour to pleaſe by her beauty, which ſhe knows to be naturally liable to raiſe looſe deſires; and that ſhe ought not only to avoid all affected beauty, but even to conceal and cover her natural beauty.

Mid-**WIFE**, *Obſtetrix*. See DELIVERY, FOETUS, SECUNDINE, VIRGINITY, &c.

WILDERNESS, ſee DESART, GROVE, LABYRINTH, &c.

WILD-FIRE, *Ignis Gregalis*, or *Græcus*. See FIRE.

WILD-FIRE *Arrows*, ſuch as are trimmed with *wild-fire*, and ſhot burning, to ſtick in the ſails or rigging of ſhips in a fight.

WILD-*Fire*, alſo denotes a diſeaſe in cattle; which is infectious, deadly, and even imputed incurable. See MURRAIN.

WILD-*Honey*. See the article HONEY.

WILL, *Voluntas*, is uſually defined a faculty of the mind, whereby it embraces or rejects any thing repreſented to it, as good or evil by the judgment. See SOUL, FACULTY, GOOD, EVIL, &c.

Others will have it to be the mind itſelf, conſidered as embracing or refuſing; adding, that as the underſtanding is nothing

thing elſe but the ſoul, conſidered as *perceiving*; ſo the *will* is nothing elſe but the ſoul conſidered as *willing*, &c. See SOUL, UNDERSTANDING, *&c.*

Mr. Locke more intelligibly defines the *will*, a faculty which the ſoul has of beginning, or forbearing, continuing or ending ſeveral actions of the mind, and motions of the body, barely by a thought or preference of the mind, ordering, or as it were, commanding the doing, or not doing, ſuch and ſuch a particular action.— This power the mind has, to order the conſideration of any idea, or the forbearing to conſider it; or to prefer the motion of any part of the body to its reſt, and vice verſa, is what we call the *will.* See POWER.

The actual exerciſe of that power, is what we call *volition*, or *willing*; and the doing or forbearing any action conſequent on ſuch order of the mind, is called *voluntary*. See VOLUNTARY, &c.

Father Malebranche lays it down, that the *will* is that to the ſoul, which motion is to the body; and argues that as the author of nature is the univerſal cauſe of all the motions in matter, ſo he is of all the inclinations in the mind: and that as all motions are direct, unleſs their courſe be diverted and changed by ſome foreign cauſe; ſo all inclinations are right, and could have no other end, but the enjoyment of truth and goodneſs, were there not ſome foreign cauſe, to determine the natural impreſſion to evil ends. See NATURAL *Inclination.*

Accordingly, he defines *will* to be the impreſſion or natural motion, which carries us towards good indeterminately, and in the general; and the power the mind has, to direct this general impreſſion towards any particular object that pleaſes it, is what he calls *liberty*. See LIBERTY, and NECESSITY.

Ariſtotle diſtinguiſhes two kinds of acts of the *will*; viz. βȣλησις, *willing*, *volition*; and προαιρεσις, *election.*— The firſt, that employed about the ultimate end; the latter, about the means.

The ſchoolmen alſo diſtinguiſh the actions of the *will*, into *elicit* and *commanded*— Elicit acts, *actiones elicitæ*, are thoſe immediately produced by the *will*, are really inherent therein; ſuch are *willing*, and *nilling.*— Commanded acts, *actiones imperatæ*, are effects produced by other powers, *v. gr.* the ſenſitive, intellective, or locomotive powers, at the command or inſtigation of the *will*— As, to *follow*, *ſtay*, *fight*, *fly*, &c. See ACT, ACTION, &c.

But others will have the former kind properly to belong to the underſtanding; and only the latter to the *will.*

The word *will* is taken in three ſenſes; 1°. For the power, or faculty of *willing*; in which ſenſe it is, we have conſidered it above.— 2°. For the act, or exerciſe of this power; as, when we ſay, no man *wills* his own deſtruction.—

3°. For a habit, or a conſtant diſpoſition and inclination to do any thing.— In which ſenſe, juſtice is defined a conſtant *will*, to give every one what belongs to him: *juſtitia eſt conſtans & perpetua voluntas jus ſuum unicuique tribuendi. Inſtit.* Juſtin.

Antecedent WILL. See the article ANTECEDENT.

Free WILL. See LIBERTY, and FREEDOM.

WILL, *Laſt* WILL, or *Teſtament*, in law, a ſolemn act, or inſtrument, whereby a perſon declares his mind and intention as to the diſpoſal of his goods, effects, *&c.* after his death. See TESTAMENT.

Wills are of two kinds: A *will in writing*— And a *will by word of mouth* only, called a *nuncupative will*; which being proved by three or more witneſſes, may be of as good force as that in writing; except for lands, which are only deviſable by teſtament in writing, during the life of the teſtator. See NUNCUPATIVE.

Probate of a WILL. See the article PROBATE.

WILL *with a wiſp*, a meteor known among the people under this name; but more uſually among authors, under that of *ignis fatuus.* See *Ignis* FATUUS.

WIMPLE, of the Dutch *wimpel*, a muffler, or plaited linen cloth, which nuns wear to cover their necks and breaſt.

The word is alſo ſometimes uſed for a ſtreamer, or flag. See FLAG, &c.

WIN, in the beginning or end of the names of places, ſignifies that ſome great battle was fought, or a victory gained there.— The word is formed from the Saxon *winnan*, to win or overcome.

WIND, *Ventus*, a ſenſible agitation of the air, whereby a large quantity thereof flows out of one place, or region, into another. See AIR.

The *winds* are divided into *perennial*, *ſtated*, and *variable*— They are alſo divided into *general*, and *particular*.

Perennial, or *conſtant* WINDS, are ſuch as always blow the ſame way.— Of theſe we have a very notable one between the two tropics blowing conſtantly from eaſt to weſt; called the *general trade-wind.* See TRADE-*Wind.*

Stated, or *periodical* WINDS, are ſuch as conſtantly return at certain times.— Such are the ſea and land-breezes, blowing from ſea to land in the evening; and from land to ſea in the morning. See BREEZE.

Such alſo are the *ſhifting*, or *particular trade-winds*, which, for certain months of the year, blow one way, and the reſt of the year, the contrary way. See MONSOON.

Variable, or *erratic* WINDS, are ſuch as blow now this, now that way; are now up, now huſhed, without any rule or regularity, either as to time or place.

Such are all the *winds* obſerved in the inland parts of England, *&c.* Though ſeveral of theſe claim their certain times of the day.— Thus, the *weſt-wind* is moſt frequent about noon; the *ſouth-wind* in the night; the *north* in the morning, *&c.* See WEATHER.

General WIND, is ſuch a one, as at the ſame time blows the ſame way, over a very large tract of ground, almoſt all the year.— Such only is the *general trade-wind.*

But even this has its interruptions: for, 1°. At land it is ſcarce ſenſible at all, as being broke by the interpoſition of mountains, valleys, *&c.* 2°. At ſea, near the ſhore, it is diſturbed by vapours, exhalations, and particular *winds*, blowing from landward; ſo that it is chiefly conſidered as *general*, only at mid-ſea: Where, 3°. It is liable to be diſturbed by clouds driving from other quarters.

Particular WINDS include all others, excepting the general *trade-winds.*

Thoſe peculiar to one little canton, or part, as called *topical*, or *provincial-winds.*— Such is the north-*wind*, on the weſtern ſide of the Alps, which does not blow above one or two leagues lengthwiſe, and much leſs in breadth: ſuch alſo is the pontias in France, *&c.*

Phyſical cauſe of WINDS.— Some philoſophers, as Des Cartes, Rohault, *&c.* account for the general *wind*, from the diurnal rotation of the earth; and from this general *wind* derive all the particular ones.— The atmoſphere, ſay they, inveſting the earth, and moving round it; that part will perform its circuit ſooneſt, which has the ſmalleſt circle to deſcribe: The air therefore, near the equator, will require a ſomewhat longer time to perform its courſe in, from weſt to eaſt, than that nearer the poles.— Thus, as the earth turns eaſtward, the particles of the air near the equinoctial, being exceeding light, are left behind; ſo that, in reſpect of the earth's ſurface, they move weſtwards, and become a conſtant eaſterly *wind.*

This opinion ſeems confirmed by this, that theſe *winds* are found only between the tropics, in thoſe parallels of latitude where the diurnal motion is ſwifteſt.— But the conſtant calms in the Atlantic ſea, near the equator, the weſterly *winds* near the coaſt of Guinea, and the periodical weſterly monſoons, under the equator in the Indian ſeas, declare the inſufficiency of this hypotheſis.

Beſides, the air being kept cloſe to the earth by the principle of gravity, would, in time, acquire the ſame degree of velocity, that the earth's ſurface moves with, as well in reſpect of the diurnal rotation, as of the annual about the ſun, which is about thirty times ſwifter.

Dr. Halley, therefore, ſubſtitutes another cauſe, capable of producing a like conſtant effect, not liable to the ſame objections, but agreeable to the known properties of the elements of water and air, and the laws of the motion of fluid bodies.— Such a one is the action of the ſun's beams upon the air and water, as he paſſes every day over the ocean, conſidered together with the quality of the ſoil, and the ſituation of the adjoining continents.

According to the laws of ſtatics, the air, which is leſs rarefied or expanded by heat, and conſequently more ponderous, muſt have a motion towards thoſe parts thereof, which are more rarefied, and leſs ponderous, to bring it to an equilibrium; alſo the preſence of the ſun, continually ſhifting to the weſtward, that part towards which the air tends, by reaſon of the refraction made by his greateſt meridian heat, is, with him, carried weſtward; and, conſequently, the tendency of the whole body of the lower air is that way.

Thus a general eaſterly *wind* is formed, which being impreſſed upon the air of a vaſt ocean, the parts impel one the other, and ſo keep moving till the next return of the ſun, whereby ſo much of the motion, as was loſt, is again reſtored; and thus the earſterly *wind* is made perpetual.

From the ſame principle it follows, that this eaſterly *wind* ſhould, on the north ſide of the equator, be to the northwards of the eaſt, and in ſouth latitudes, to the ſouthwards thereof; for near the line, the air is much more rarefied, than at a greater diſtance from it; becauſe the ſun is twice in a year vertical there; and at no time diſtant above 23½ degrees: at which diſtance, the heat being as the ſine of the angle of incidence, is but little ſhort of that of the perpendicular ray; whereas under the tropics, though the ſun ſtay longer vertical, yet he is a long time 47 degrees off; which is a kind of winter wherein the air ſo cools, as that the ſummer heat cannot warm it to the ſame degree with that under the equator. Wherefore, the air towards the northward and ſouthward, being leſs rarefied than that in the middle, it follows, that from both ſides, it ought to tend towards the equator. See Heat.

This motion compounded with the former eaſterly *wind*, accounts for all the phænomena of the general trade-*winds*; which, if the whole ſurface of the globe was ſea, would undoubtedly blow quite round the world, as they are found to do in the Atlantic, and the Ethiopic oceans. But ſeeing ſo great continents do interpoſe, and break the continuity of the oceans, regard muſt be had to the nature of the ſoil, and the poſition of the high mountains, which are the two principal cauſes of the variation of the *wind*, from the former general rule: for if a country lying near the ſun prove to be flat, ſandy, and low land; ſuch as the deſarts of Lybia are uſually reported to be; the heat occaſioned by the reflections of the ſun's beams, and the retention thereof in the ſand, is incredible to thoſe who have not felt it; whereby the air being exceedingly rarefied, it is neceſſary that the cooler, and more denſe air, ſhould run thitherwards to reſtore the equilibrium.

This is ſuppoſed to be the cauſe, why near the coaſt of Guinea, the *wind* always ſets in upon the land, blowing weſterly, inſtead of eaſterly; there being ſufficient reaſon to believe, that the inland parts of Africa are prodigiouſly hot, ſince the northern borders thereof were ſo intemperate, as to give the antients cauſe to conclude that all beyond the tropics was uninhabitable by exceſs of heat. See Torrid, and Zone.

From the ſame cauſe it happens, that there are ſo conſtant calms in that ſame part of the ocean called the *rains*; for this tract being placed in the middle, between the weſterly *winds* blowing on the coaſt of Guinea, and the eaſterly trade-*winds*, blowing to the weſtwards thereof; the tendency of the air here, is indifferent to either, and ſo ſtands in equilibrio between both: and the weight of the incumbent atmoſphere, being diminiſhed by the continual contrary *winds* blowing from hence, is the reaſon that the air here holds not the copious vapour it receives, but lets it fall in ſo frequent rains. See Rains.

But, as the cool and denſe air, by reaſon of its greater gravity, preſſes upon the hot and rarefied, it is demonſtrable, that this latter muſt aſcend in a continued ſtream, as faſt as it rarefies; and that being aſcended, it muſt diſperſe itſelf, to preſerve the equilibrium; that is, by a contrary current, the upper air muſt move from thoſe parts where the greateſt heat is: ſo, by a kind of circulation, the north-eaſt trade-*wind* below, will be attended with a ſouth-weſterly *wind* above; and the ſouth-eaſt, with a north-weſt *wind* above. See Current, Under-*Current*, &c.

That this is more than a bare conjecture, the almoſt inſtantaneous change of the *wind* to the oppoſite point, which is frequently found in paſſing the limits of the trade-*winds*, ſeems to aſſure us; but that which above all confirms this hypotheſis, is the phænomenon of the monſoons, by this means moſt eaſily ſolved, and without it hardly explicable. See Monsoon.

Suppoſing therefore ſuch a circulation as above; it is to be conſidered, that to the northward of the Indian ocean, there is every where land, within the uſual limits of the latitude of 30°, *viz.* Arabia, Perſia, India, &c. which, for the ſame reaſon as the Mediterranean parts of Africa are ſubject to inſufferable heats, when the ſun is to the north, paſſing nearly vertical; but yet are temperate enough, when the ſun is removed towards the other tropic, becauſe of a ridge of mountains at ſome diſtance within the land, ſaid to be frequently, in winter, covered with ſnow, over which the air, as it paſſes, much needs be much chilled.— Hence it happens, that the air coming, according to the general rule, out of the north-eaſt, to the Indian ſea, is ſometimes hotter, ſometimes colder, than that which, by this circulation, is returned out of the ſouth weſt; and, by conſequence, ſometimes the under current, or wind, is from the north-eaſt, ſometimes from the ſouth-weſt.

That this has no other cauſe, is clear from the times wherein theſe winds ſet, *viz.* in April: when the ſun begins to warm theſe countries to the north, the ſouth-weſt monſoons begin, and blow, during the heats, till October, when the ſun being retired, and all things growing cooler northward, and the heat increaſing to the ſouth, the north-eaſt *winds* enter and blow all the winter, till April again. And it is, undoubtedly, from the ſame principle, that to the ſouthward of the equator, in part of the Indian ocean, the north-weſt *winds* ſucceed the ſouth-eaſt, when the ſun draws near the tropic of Capricorn. See Tide.

But, the induſtry of ſome late writers, having brought the theory of the production and motion of *winds*, to ſomewhat of a mathematical demonſtration; we ſhall here give it the reader in that form.

Laws of the production of Winds.— If the ſpring of the air be weakened in any place, more than in the adjoining places; a *wind* will blow through the place where the diminution is. See Air, and Elasticity.

For, ſince the air endeavours, by its elaſtic force, to expand itſelf every way; if that force be leſs in one place than another; the niſus of the more, againſt the leſs elaſtic, will be greater than the niſus of the latter, againſt the former.— The leſs elaſtic air, therefore, will reſiſt with leſs force than it is urged by the more elaſtic: conſequently, the leſs elaſtic will be driven out of its place, and the more elaſtic will ſucceed.

If, now, the exceſs of the ſpring of the more elaſtic, above that of the leſs elaſtic air, be ſuch as to occaſion a little alteration in the baroſcope; the motion both of the air expelled, and that which ſucceeds it, will become ſenſible; *i. e.* there will be a *wind*.

2°. Hence, ſince the ſpring of the air increaſes, as the compreſſing weight increaſes, and compreſſed air is denſer than air leſs compreſſed; all *winds* blow into rarer air, out of a place filled with a denſer.

3°. Wherefore, ſince a denſer air is ſpecifically heavier than a rarer; an extraordinary lightneſs of the air in any place, muſt be attended with extraordinary *winds*, or ſtorms.

Now, an extraordinary fall of the mercury in the barometer, ſhewing an extraordinary lightneſs of the atmoſphere; it is no wonder if that foretels ſtorms. See Barometer.

4°. If the air be ſuddenly condenſed in any place, its ſpring will be ſuddenly diminiſhed: hence, if this diminution be great enough to affect the barometer, there will a *wind* blow through the condenſed air.

5°. But ſince it cannot be ſuddenly condenſed, unleſs it have before been much rarefied; there will a *wind* blow through the air, as it cools, after having been violently heated.

6°. In like manner, if air be ſuddenly rarefied, its ſpring is ſuddenly increaſed; wherefore it will flow through the contiguous air, not acted on by the rarefying force.— A *wind*, therefore, will blow out of a place, in which the air is ſuddenly rarefied: and on this principle, in all probability, it is, that,

7°. Since the ſun's power in rarefying the air is notorious, it muſt neceſſarily have a great influence on the generation of *winds*. See Heat, Rarefaction, &c.

8°. Moſt caves are found to emit *wind*, either more or leſs. The riſing and changing of the *wind*, is determined experimentally, by means of weather-cocks placed a-top of houſes, &c.— But theſe only indicate what paſſes about their own heighth, or near the ſurface of the earth: Wolfius aſſures us, from obſervations of ſeveral years, that the higher *winds*, which drive the clouds, are different from the lower ones, which move the weather-cocks.— And Mr. Derham obſerves ſomething not unlike this. *Phyſ. Theol.* L. I. c. 2.

The author laſt mentioned relates, upon comparing ſeveral ſeries's of obſervations made of the *winds* in divers countries, *viz.* England, Ireland, Switzerland, Italy, France, New-England, &c. that the *winds* in thoſe ſeveral places ſeldom agree; but when they do, it is commonly when they are ſtrong, and of long continuance in the ſame quarter; and more, he thinks, in the northerly and eaſterly, than in other points.— Alſo, that a ſtrong *wind* in one place, is oftentimes a weak one in another; or moderate, according as the places are nearer, or more remote. *Philoſoph. Tranſactions*, N° 267, and 321.

Laws of the Force and Velocity of Wind.— *Wind* being only air in motion, and air being a fluid, ſubject to the laws of other fluids, its force may be brought to a preciſe computation: thus— "The ratio of the ſpecific gravity of any other "fluid to that of air, together with the ſpace that fluid, im"pelled by the preſſure of the air, moves in any given time, "being given; we can determine the ſpace which the air "itſelf, acted on by the ſame force, will move in the ſame "time." By this rule:

1°. As the ſpecific gravity of air, is to that of any other fluid; ſo, reciprocally, is the ſquare of the ſpace which that fluid, impelled by any force, moves in any given time, to the ſquare of the ſpace which the air, by the ſame impulſe, will move in the ſame time.

Suppoſing, therefore, the ratio of the ſpecific gravity of that other fluid to that of air, to be $= b : c$; the ſpace deſcribed by the fluid to be called s; and that which the air will deſcribe by the ſame impulſe, x. The rules gives us $x = \sqrt{(b s^2 : c.)}$

Hence, if we ſuppoſe water impelled by the given force, to move two feet in a ſecond of time; then will $s = 2$; and ſince the ſpecific gravity of water to the air, is as 970 to 1; we ſhall have $b = 970$, and $c = 1$; conſequently $x = \sqrt{970 . 4} = \sqrt{3880} = 623$ feet. The velocity of the *wind* therefore, to that of water moved by the ſame power, will be as 623 to 2; *i. e.* if water move two feet in a ſecond, the *wind* will fly 623 feet.

2°. Add, that $s = \sqrt{(c x^2 : b)}$; and therefore the ſpace any fluid, impelled by any impreſſion, moves in any time, is determined, by finding a fourth proportional to the two numbers that expreſs the ratio of the ſpecific gravity, and the ſquare of the ſpaee the *wind* moves in, in the given time.— The ſquare root of that fourth proportional is the ſpace required.

M. Mariotte, *e. gr.* found, by various experiments, that a pretty ſtrong *wind* moves 24 feet in a ſecond of time; wherefore, if the ſpace which the water, acted on by the ſame force as the air, will deſcribe in the ſame time, be required; then will $c = 1$, $x = 24$, $b = 970$; and we ſhall find $f = \surd(576 : 970) = \frac{2}{3}\pm$.

3°. "The velocity of *wind* being given, to determine the "preſſure required to produce that velocity;" we have this rule:— The ſpace the *wind* moves in one ſecond of time, is to the heighth a fluid is to be raiſed in an empty tube, in order to have a preſſure capable of producing that velocity; in a ratio compounded of the ſpecific gravity of the fluid to that of the air, and of quadruple the altitude a body deſcends in the firſt ſecond of time, to the aforeſaid ſpace of the air.

Suppoſe, *e. gr.* the ſpace the air moves in a ſecond, $a = 24$ feet, or 288 inches; call the altitude of the third x, and the ratio of mercury to air $b : c = 13580 : 1$, $d = 181$ inches; x will be leſs than that number by one line, or $\frac{1}{12}$ of an inch.— And hence we ſee why a ſmall, but ſudden change in the barometer, is followed with violent *winds*. See BAROMETER.

The force of the *wind* is determined experimentally by a peculiar machine, called an *anemometer*, wind-meaſurer; which being moved by means of ſails, like thoſe of a windmill, raiſes a weight, that, ſtill the higher it is raiſed, receding further from the centre of motion, by ſliding along an hollow arm fitted on to the axis of the ſails, becomes heavier and heavier, and preſſes more on the arm, till being a counter-poiſe to the force of the *wind* on the ſails, it ſtops the motion thereof.— An index, then, fitted upon the ſame axis at right angles with the arm, by its riſing or falling, points out the ſtrength of the *wind*, on a plane divided like a dial-plate into degrees. See ANEMOMETER.

Qualities and Effects of WIND.— 1°. "A *wind* blowing from "the ſea, is always moiſt: in ſummer, it is cold; and in "winter, warm; unleſs the ſea be frozen up."— This is demonſtrated thus: There is vapour continually riſing out of all water (as appears even hence, that a quantity of water being left a little while in an open veſſel, is found ſenſibly diminiſhed) but eſpecially if it be expoſed to the ſun's rays; in which caſe, the evaporation is beyond all expectation. See VAPOUR.— By this means, the air incumbent on the ſea becomes impregnated with a deal of vapour. But the *winds* blowing from off the ſea, ſweep theſe vapours along with them; and conſequently are always moiſt.

Again, water in ſummer, *&c.* conceives leſs heat than terreſtrial bodies expoſed to the ſame rays of the ſun; but in winter, ſea-water is warmer than the earth covered with froſt and ſnow, *&c.* Wherefore, as the air contiguous to any body, is found to partake of its heat and cold, the air contiguous to ſea-water wiill be warmer in winter, and colder in ſummer, than that contiguous to the earth.— Or thus: Vapours raiſed from water by the ſun's warmth in winter, are warmer than the air they riſe in (as appears from the vapours condenſing, and becoming viſible, almoſt as ſoon as they are got out into air.) Freſh quantities of vapour, therefore, continually warming the atmoſphere over the ſea, will raiſe its heat beyond that of air over the land.— Again, the ſun's rays reflected from the earth into the air, in ſummer, are much more than thoſe from the water into air: the air, therefore, over the earth, warmed by the reflection of more rays than that over water, is warmer.— Hence, *ſea-winds* make thick, cloudy, hazy weather.

2°. "*Winds* blowing from the continent, are always dry; "in ſummer warm; and cold in winter."— For there is much leſs vapour ariſing from the earth, than from water; and therefore the air over the continent will be impregnated with much fewer vapours.— Add, that the vapours, or exhalations, raiſed by a great degree of heat out of the earth, are much finer, and leſs ſenſible, than thoſe from water.— The wind, therefore, blowing over the continent, carries but little vapour with it; and is therefore dry.

Further, the earth in ſummer is warmer than water expoſed to the ſame rays of the ſun.— Hence, as the air partakes of the heat of contiguous bodies; that over the earth in ſummer will be warmer than that over the water: therefore the *wind*, &c.

After the like manner it is ſhewn, that the *land-winds* are cold in winter.— Hence, we ſee why *land-winds* make clear, cold weather. See WEATHER.

Our northerly and ſoutherly *winds*, however, which are commonly eſteemed the cauſes of cold and warm weather, Mr. Derham obſerves, are really rather the effect of the cold or warmth of the atmoſphere.— Hence it is, that we frequently ſee a warm ſoutherly wind, on a ſudden, changed to the north, by the fall of ſnow, or hail; and that in a cold, froſty morning, we ſee the *wind* north, which afterwards wheels about towards the ſoutherly quarter, when the ſun has well warmed the air; and again, in the cold evening, turns northerly, or eaſterly.

For the manner wherein north-eaſterly *winds* contribute to blights, ſee BLIGHT.— For the effects of *winds* on the barometer, and thermometer; ſee BAROMETER, and THERMOMETER.

WIND, in navigation, is the ſame agitation of the air, conſidered as ſerving for the motion of veſſels on the water. See SAILING.

The *winds* are divided, with reſpect to the points of the horizon from which they blow, into *cardinal*, and *collateral*.

Cardinal WINDS, are thoſe blowing from the four cardinal points; eaſt, weſt, north, and ſouth. See POINT, and CARDINAL.

Collateral WINDS, are the intermediate *winds* between two cardinal *winds*.— The number of theſe is infinite, as the points from which they blow are; but only a few of them are conſidered in practice: *i. e.* only a few of them have their diſtinguiſhing names. See COLLATERAL.

The antient Greeks, at firſt, only uſed the four cardinal ones; at length they took in four more.— Vitruvius gives us a table of twenty, beſides the cardinals, in uſe among the Romans.

The moderns, as their navigation is much more perfect than the antient, have given names to twenty-eight collateral ones; which they range into *primary*, and *ſecundary*— and the ſecundary they ſubdivide into thoſe of the *firſt* and *ſecond order*. See POINT.

The Engliſh Names of the primary collateral *winds* and points, are compounded of the names of the cardinal ones, north and ſcuth being ſtill prefixed.

The names of the ſecundary collateral *winds* of the firſt order, are compounded of the names of the cardinals, and the adjacent primary one.— Thoſe of the ſecond order, are compounded of the names of the cardinal, or the next adjacent primary; and the next cardinal, with the addition of the word *(by)*.— The Latins have diſtinct names for each; all which are expreſſed in the following table.

Names of the *winds*, and points of the compaſs.		Diſtances of the points, *&c.* from the north.	
Engliſh.	Latin, and Greek.		
1. *North.*	*Septentrio*, or *Boreas.*	0°	0′
2. North by eaſt.	Hyperboreas. Hypaquilo. Gallicus.	11	15
3. North-north-eaſt.	Aquilo.	22	30
4. North-eaſt by north.	Meſoboreas. Meſaquilo. Supernas.	33	45
5. *North-Eaſt.*	*Arctapeliotes.* *Borapeliotes.* *Græcus.*	45	
6. North-eaſt by eaſt.	Hypocæſias.	56	15
7. Eaſt-north-eaſt	Cæſias, helleſpontius.	67	30
8. Eaſt by north.	Meſocæſias. Carbas.	78	30
		From the eaſt.	
9. *Eaſt.*	*Solanus*, *ſubſolanus*, *apeliotes.*	0°	0′
10. Eaſt by ſouth.	Hypeurus, or hypercurus.	11	15
11. Eaſt-ſouth-eaſt.	Eurus, or volturnus.	22	30
12. South-eaſt by eaſt.	Meſeurus.	33	45
13. *South-Eaſt.*	*Notapeliotes*, *euroauſter.*	45	
14. South-eaſt by ſouth.	Hypophœnix.	56	15
15. South-ſouth-eaſt.	Phœnix, phœnicias, leuco-notus, gangeticus.	67	30
16. South by eaſt.	Meſophœnix.	78	45
		From the ſouth.	
17. *South.*	*Auſter*, *notus*, *meridies.*	0°	0′
18. South by weſt.	Hypolibononotus, alſanus.	11	15
19. South-ſouth-weſt.	Libonotus, notoliblycus, auſtro-africus.	22	30
20. South-weſt by ſouth.	Meſolibonotus.	33 45	45
21. *South-weſt.*	*Noto-zephyrus.* *Noto-libycus.* *Africus.*	56	15
22. South-weſt by weſt.	Hypolibs. Hypafricus. Subveſperus.		
23 Weſt-ſouth-weſt	Libs.	67	30
24. Weſt by ſouth.	Meſolibs. Meſozephyrus.	78	45

Names of the *winds*, and points of the compaſs.		Diſtances of the points, *&c.* from the weſt.	
Engliſh.	Latin, and Greek.		
25. *Weſt.*	*Zephyrus, favonius, occidens.*	0°	0′
26. Weſt by north.	Hypargeſtes. Hypocorus.	11	15
27. Weſt-north-weſt.	Argeſtes. Caurus, corus, japyx.	22	30
28. North-weſt by weſt.	Meſargeſtes. Meſocorus.	33	45
29. *North-weſt.*	*Zephyro-boreas, borolibycus, olimpias.*	45	
30. North-weſt by north.	Hypocircius. Hypothraſcias. Scirem.	56	15
31. North-north-weſt.	Circius, thraſcias.	67	30
32. North by weſt.	Meſocircius.	78	45

Note, The antient names are here, after Ricciolus, adapted to the modern ones; not as the *winds* formerly denoted by thoſe, were preciſely the ſame with theſe, (for the antient number and diviſion being different from the modern, the points they refer to will be ſomewhat different) but as theſe are what come the neareſt.— Thus, Virtruvius only reckoning twenty-four *winds*, diſpoſes the points they refer to in a different order; as in the following table.

Names of the *winds.*	Diſtance from north.		Names of the *winds.*	Diſtance from eaſt.	
1 *Septentrio.*	0°	0′	7 *Salanus.*	0°	0′
2 Gallicus.	15		8 Ornithias.	15	
3 Supernas.	30		9 Cæcias.	30	
4 Aquilo.	45		10 Eurus.	45	
5 Boreas.	60		11 Volturnus.	60	
6 Carbas.	75		12 Euronotus.	75	
Names of the *winds.*	Diſtance from ſouth.		Names of the *winds.*	Diſtance from weſt.	
13 *Auſter.*	0°	0′	19 *Favonius.*	0°	0′
14 Alſanus.	15		20 Eteſiæ.	15	
15 Libonotus.	30		21 Circius.	30	
16 Africus.	45		22 Caurus.	45	
17 Subveſper.	60		23 Corus.	60	
18 Argeſtes.	75		24 Thraſcias.	75	

For the uſe of the *winds* in navigation, *&c.* ſee SAILING, RHUMB, COMPASS, &c.

Quarter WIND. See the article QUARTER.

Whirl-WIND. See the article WHIRL-*Wind.*

WIND-COLIC. } See the article { COLIC.
WIND-DROPSY. } See the article { TYMPANITES.

WIND-EGG, an addle egg, or egg that has taken *wind.* See EGG.

WIND-FALL, denotes fruit blown off the tree by the *wind.*

WIND-FURNACE. See the article FURNACE.

WIND-GALL, in horſes, a ſoft, flatulent tumor, or bladder, ariſing on the fetlock joint, and cauſing great pain, eſpecially in hot weather, and hard ways.

It is uſually owing to a violent ſtrain, extreme labour, and heat, a horſe's ſtanding on a ſloping floor, a blow from another, or the like.

WIND-GUN, a machine, ſerving to explode bullets, and other ſhot, with great violence, by the force of the air. See GUN.

This ſort of arm, charged with air, has an effect ſcarce inferior to that of a common fire-arm charged with gun-powder; but it diſcharges itſelf with a much leſs report: and it is this, which, in all probability, gave occaſion to the fable of white gun-powder. See GUN-*Powder.*

There are *wind-guns* of divers contrivances; the moſt eaſy and portable one, and the moſt in uſe, is repreſented *Tab. Pneumatics, fig.* 14. It conſiſts of a round metalline tube 3, 3. open at the end *c c*, and exactly ſtopped at the other end *a*, like the barrel of other guns; 1, 1, 1, 1, is another larger metal tube, wherein the former is diſpoſed, ſo as to leave a ſpace between them 4, 4, wherein air may be incloſed.— The two tubes are joined together at the common aperture *c c*, by a circular plate exactly ſoldered to both, ſo as to prevent the air from eſcaping out of the ſpace 4, 4, *&c.*— At 8 is a ſpring valve, which opening inwardly, lets the air paſs through from 2 into the ſpace 1, but prevents its return from 1 to 2.— Near the cloſe end of the inner tube are two holes, 6 and 5; by the firſt, the ſpace 1 and the inner tube communicate, ſo that the air would paſs out of that into this, but that the paſſage is ſtopped by a valve opening outwardly; by the latter, there is a communication between the open air, the ſpace 4, and the inner barrel: only the air pent up in the ſpace cannot eſcape at this hole, by reaſon of a little tube exactly ſoldered to both barrels, which ſtops the communication: nor can air eſcape out of the inner barrel through this little tube, by reaſon of a little moveable pin, which exactly fills the cavity of the tube.

Laſtly, the part 2, 2, 2, 2, repreſents the body of a ſyringe, or ſucking pump; by which, as much air as poſſible, is to be intruded into the ſpace 4, 4, *&c.*— After which a bullet being put into a cavity of the inner barrel as high as the little tube 5, the gun is charged. See SYRINGE.

Now, to diſcharge it, the little valve 6 is puſhed up by means of the pin that plays in the little tube 5. Upon this, the compreſſed air in the cavity of the outer barrel 4, ruſhing through the hole 6 into the cavity of the inner barrel, expels the bullet with a vaſt force, ſufficient to penetrate a thick board.

Note, To give the machine a greater reſemblance of a fire-arm, the part 2, 2, 2, 2, is uſually faſhioned like the butt-end of a muſquet; and on the part 2, 8, 2, 8, is fitted a lock; by turning the trigger of which, the pin 5 is made to puſh back the valve, and ſo diſcharge the piece.— By the lock too, it is contrived, that either the whole charge of air may be ſpent at one exploſion, or only part of it, and the reſt reſerved for freſh bullets.— By this piece of mechaniſm, we can have half a dozen good, effective ſhoots, with one charge of air.

WIND-INSTRUMENTS, in muſic, are inſtruments played by the *wind*, chiefly the breath; in contradiſtinction to *ſtring-inſtruments*, and inſtruments of the *pulſatile* kind. See MUSIC.

The *wind-inſtruments* known to the antients, were the *tibia*, *fiſtula*, *ſyringa* of Pan, conſiſting of ſeven reeds joined ſidewiſe; alſo *organs*, *tubæ*, *cornua*, and *lituus.* See FISTULA, ORGAN, &c.

Thoſe of the moderns, are the *flute*, *bagpipe*, *hautboy*, *trumpet*, &c. See FLUTE, TRUMPET, BAGPIPE, &c.

WIND-MILL, a kind of mill which receives its motion from the impulſe of the *wind.* See MILL.

The *wind-mill*, though a machine common enough, has yet ſomewhat in it more ingenious than it is uſually imagined.— Add, that it is commonly allowed to have a degree of perfection which few of the popular engines have attained to, and which the makers are but little aware of.— Though the new geometry, *&c.* has furniſhed ample matter for its improvement.

Structure of the WIND-*Mill.*— The internal ſtructure of the *wind-mill*, is much the ſame with that of water-mills.—The difference between them lies chiefly in an external aparatus, for the application of the power.

This apparatus conſiſts of an axis E F (*Tab. Pneumatics, fig.* 15.) through which paſs two arms, or yards, A B, and C E, interſecting each other at right angles in E, whoſe length is uſually about 32 feet: on theſe yards are formed a kind of ſails, vanes, or flights, in the figure of trapeziums, with parallel baſes, the greater whereof, H I, is about ſix feet, and the leſs, F G, determined by radii drawn from the centre E, to I and H.

Theſe ſails are to be capable of being always turned to the *wind*, that they may receive its impreſſion: in order to which, there are two different contrivances, which conſtitute the two different kinds of *wind-mills* in uſe.

In the one, the whole machine is ſuſtained upon a moveable arbor or axis, perpendicular to the horizon, on a ſtand, or foot; and turned occaſionally this way, or that, by means of a lever.

In the other, only the cover, or roof of the machine, with the axis and ſails, turn round.— In order to which,

The cover is built turret-wiſe, and the turret encompaſſed with a wooden ring, wherein is a groove, at the bottom whereof are placed, at certain diſtances, a number of braſs truckels, and within the groove is another ring, upon which the whole turret ſtands.— To the moveable ring are connected beams *a b* and *f c*; and to the beam *a b*, in *b* is faſtened a rope, which at the other extreme thereof, is fitted to a windlaſs, or axis in peritrochio: this rope being drawn through the iron hook G, and the windlaſs turned, the ſails will be moved round, and put in the direction required.

Theory of the motion of a WIND-*Mill with the poſition of the ſails, or vanes thereof.*— The angle the ſails are to make with their common axis, ſo as the *wind* may have the greateſt effect, is a matter of nice enquiry, and has employed the thoughts of the mathematicians.

To conceive why a *wind-mill* moves at all, the theory of compound motions muſt be ſuppoſed.— A body moving perpendicularly againſt any ſurface, ſtrikes it with all its force. If it move parallel to the ſurface, it does not ſtrike it at all: and if it move obliquely, its motion being compounded of the perpendicular and parallel motion, only acts on the ſurface, conſidered as it is perpendicular, and only drives it in the direction of the perpendicular. So that every oblique direction of a motion, is the diagonal of a parallelogram, whoſe perpendicular and parallel directions, are the two ſides. Add, that if a ſurface, which being ſtruck obliquely, has only received the perpendicular direction, be faſtened to ſome other body, ſo as that it cannot purſue its perpendicular direction, but muſt change it for ſome other; in that caſe, the perpendicular itſelf becomes the diagonal of a new parallelogram, one of whoſe ſides is the direction the ſurface may follow, and the other, that it cannot. See COMPOUND, and MOTION.

Thus, a rudder faſtened obliquely to the keel of a veſſel, being ſtruck by the current of water parallel to the keel, and, of conſequence, obliquely with regard to itſelf; it will appear, by drawing the line of perpendicular impulſe, that it tends to tear the rudder from the keel, and to carry it away: and that this direction perpendicular to the rudder, is oblique to the keel.— The rudder, then, would be carried off in an oblique direction: but, as, in reality, it is ſo ſecured, that it cannot be torn or carried off; we are only to conſider, in this compound motion, that of the two directions, wherewith it can move without being torn from the keel: and leave the other, which would tear it off, as uſeleſs.

Now, the direction in which it can move without parting from the keel, is that which carries it circularly about its extremity, as a centre. So that the effect of the oblique impulſe of the water on the rudder, is reduced, firſt to a perpendicular impreſſion, which is again reduced to the mere turning the rudder round; or, if the rudder be immoveable, to the turning of the veſſel.

Now, in an oblique and compound motion, where only one of the directions is of ſervice; the greater ratio the other has thereto, the leſs effect will the motion have; and vice verſa. — In examining the compound motions of the rudder, we find that the more oblique it is to the keel, the ratio of the direction that ſerves to turn it to the other, is the greater. But, on the other hand, the more oblique it is to the keel, and, of conſequence, to the courſe of the water which is ſuppoſed parallel thereto, the more weakly it ſtrikes. The obliquity of the rudder, therefore, has, at the ſame time, both an advantage, and a diſadvantage; but as thoſe are not equal, and as each of them is ſtill varying with every different poſition of the rudder, they become complicated variouſly, ſo that ſometimes the one prevails, and ſometimes the other.

It has been a point of enquiry to find the poſition of the rudder, wherein the advantage ſhould be the greateſt.— M. Renau, in his famous theory of the working of ſhips, has found, that the beſt ſituation of the rudder is, when it makes an angle of 55 degrees with the keel. See SAILING, STEERING, &c.

If, now, a *wind-mill*, expoſed directly to the wind, ſhould have its four ſails perpendicular to the common axis wherein they are fitted, they would receive the *wind* perpendicularly; and it is viſible that impulſe would only tend to overturn them. — There is a neceſſity, therefore, to have them oblique to the common axis, that they may receive the *wind* obliquely.

For the greater eaſe; let us only conſider one vertical ſail.— The oblique impulſe of the wind on this ſail, is reducible to a perpendicular impulſe: and that direction, as the ſail cannot abſolutely keep to it, is compounded of two; one whereof tends to make it turn on its axis, and the other to fall backwards.— But it is only the firſt of theſe directions can be obeyed.— Of conſequence, the whole impulſe of the *wind* on the ſail has no other effect, but to make it turn from right to left, or from left to right, as its acute angle turns this way or that. And the ſtructure of the machine is ſo happy, that the three other ſails are determined, from the ſame reaſons, to move the ſame way.

The obliquity of the ſails, with regard to their axis, has preciſely the ſame advantage, and diſadvantage, with the obliquity of the rudder to the keel.— And M. Parent, ſeeking by the new analyſis, the moſt advantageous ſituation of the ſails on the axis, finds it preciſely the ſame angle of 55 degrees. Yet, in practice, this rule is very little obſerved; as, indeed, being little known.— The ſails are uſually fixed at an angle of about 60 degrees, which is very much out of the way.

Elliptical **WIND-*Mill*.**— M. Parent conſiders further, what figure the ſails of a *wind-mill* ſhall have, to receive the greateſt impulſe from the *wind*; and he determines it to be a ſector of an ellipſis, whoſe centre is that of the axis or arbor of the mill; and the little ſemi-axis, the heighth of thirty-two feet: as for the greater, it follows neceſſarily from the rule that directs the ſail to be inclined to the axis in an angle of 55 degrees.

On this foot he aſſumes four ſuch ſails, each whereof is one fourth of an ellipſis; which, he ſhews, will receive all the *wind*, and loſe none, as the common ones do.— Theſe four ſurfaces multiplied by the lever, with which the *wind* acts on one of them, expreſs the whole power the *wind* had to move the machine, or the whole power the machine has when in motion.

The ſame manner of reaſoning, applied to a common *wind-mill*, whoſe ſails are rectangular, and their length about five times their breadth; ſhews that the *elliptic wind-mill* has above ſeven times the power of the common one. A prodigious advantage! and worthy, ſure, to have the common practice ſet aſide for, could ſo common a practice be eaſily changed.

A *wind-mill*, with ſix elliptic ſails, he ſhews, would ſtill have more power than one with four.— It would only have the ſame ſurface with the four; ſince the four contain the whole ſpace of the ellipſis, as well as the ſix. But the force of the ſix, would be greater than that of the four, in the ratio of 245 to 231.— If it were deſired to have only two ſails, each being a ſemi-ellipſis, the ſurface would be ſtill the ſame, but the power would be diminiſhed, by near one third of that with ſix ſails; by reaſon the greatneſs of the ſectors would much ſhorten the lever with which the *wind* acts.

Beſt form and proportion of rectangular **WIND-*Mills*.**— But, as elliptical ſails would be ſomething ſo new, that there is little room to expect they will come into common uſe; the ſame author has conſidered which form, among the rectangular ones, will be the moſt advantageous, *i. e.* which, the product of whoſe ſurface, by the lever of the *wind*, will be the greateſt.— And by the method *de maximis & minimis*, he finds it very different from the common ones.

The reſult of his enquiry is, that the width of the rectangular ſail ſhould be nearly double its length; whereas the length is uſually made almoſt five times the width.— Add, that as we call heighth or length, the dimenſion which is taken from the centre of the axis; the greateſt dimenſion of the new rectangular ſail, will be turned towards the axis, and the ſmalleſt from it: quite contrary to the poſition of the common ſails.

The power of a *wind-mill*, with four of theſe new rectangular ſails, M. Parent ſhews, will be to the power of 4 elliptic ſails, nearly as 13 to 23; which leaves a conſiderable advantage on the ſide of the elliptic ones: yet will the force of the new rectangular ſails, be conſiderably greater than that of the common ones.

M. Parent likewiſe conſiders what number of the new ſails will be moſt advantageous, and finds that the fewer ſails, the more ſurface there will be, but the leſs power.— The ratio of the power of a *wind-mill* with 6 ſails, will be to another with 4, nearly as 14 to 13. And the power of another with 2, will be to that with 4, nearly as 13 to 9.

As to the common *wind-mill*, its power ſtill diminiſhes as the breadth of the ſails is ſmaller, in proportion to the length. The uſual proportion, therefore, of 5 to 1, is exceedingly diſadvantageous.

The uſes of this new theory of *wind-mills* are very obvious. — The more power a *wind-mill* has, the ſwifter it turns, the more it diſpatches, and the leſs *wind* it needs.— Add, that on this theory, one may have a *wind-mill*, whoſe ſails ſhall be a deal ſhorter, and yet the power greater, than in the common one.

WIND *Tumors*, &c. See the article TUMOR.

WINDASS*, WANDASS, or WANLASS, an antient term in hunting.— Thus, to drive the *windaſs*, ſignifies the chaſing a deer to a ſtand, where one is ready with a bow or gun to ſhoot. See HUNTING.

*— *Omnes illi qui tenuerunt in bondagii tenura ſolebant vocari cuſtumarii: et quotieſcunque dominus ad venandum venerit, illi cuſtumarii ſolebant fugare* windaſſum, *ad ſtabulum, in venatione ferarum beſtiarum ſecundum quantitatem tenuræ ſuæ,* MS. de Conſuetud. Manerii de Sutton Colfield, An. 3. Ed. II.

WINDERS *of wool*. See the article WOOL-*Winders*.

WINDING *Stairs*. See the article STAIR.

WINDLASS, or WINDLACE, a machine uſed to raiſe huge weights withal, as guns, ſtones, anchors, *&c.* See MACHINE.

It is very ſimple, conſiſting only of an axis, or roller ſupported horizontally at the two ends by two pieces of wood; and a pully.— The two pieces of wood meet a-top; being placed diagonally, ſo as to prop each other.— The axis or roller goes through the two pieces, and turns in them.— The pully is faſtened a-top, where the pieces join.

Laſtly, there are two ſtaves, or hand-ſpikes go through the roller, whereby it is turned; and the rope, which comes over the pully, is wound off and on the ſame.

WINDLASS *in a ſhip*, is an inſtrument in a ſmall veſſel, placed upon the deck, abaft the fore-maſt: it conſiſts of a piece of timber, having ſix or eight ſquares. It is turned by hand-ſpikes, put into holes made for that purpoſe.

This *windlaſs* will purchaſe more than any capſtan in the weighing of an anchor or the like, and without any danger to thoſe that heave.— Since if any of the hand-ſpikes ſhould break, the *windlaſs* would pall of itſelf.

WINDOW, q. d. *Wind-door*, an aperture, or open place in the ſide of an houſe, to let in the air and light.— See *Tab. Archit. fig.* 49. ſee alſo the articles BUILDING, APERTION, LIGHT, &c.

We have various kinds and forms of *windows*; as glaſs *windows*, wire *windows*, horn *windows*, &c.— Arched *windows*, circular *windows*, elliptical *windows*, ſquare and flat *windows*; round *windows*, oval *windows*, gothic *windows*, regular *windows*, ruſtic *windows*, to which add ſky-lights. See GLASS, LEAD, PLUMBERY, VICE, &c.

The chief rules, with regard to *windows*, are— 1°. That they be as few in number, and as moderate in dimenſions as may conſiſt with other reſpects; inaſmuch as all openings are weakenings.

2°. That they be placed at a convenient diſtance from the angles, or corners of the building; becauſe that part ought not to be open and infeebled, whoſe office is to ſupport and faſten all the reſt of the building.

3°. That care be taken the *windows* be all equal one with another, in their rank and order; ſo that thoſe on the right hand may anſwer to thoſe on the left, and thoſe above, be right over thoſe below: for this ſituation of *windows*, will not only be handſome and uniform; but alſo the void being upon the void, and the full upon the full, it will be a ſtrengthening to the whole fabric.

As to their dimenſions, care is to be uſed, neither to give them more, or leſs light than is needful; therefore regard is to be had to the bigneſs of the rooms which are to receive the light.— It is evident that a great room needs more light, and, conſequently, a greater *window* than a little room; and è contra.

The apertures of *windows*, in middle-ſized houſes, may be four and a half, or five feet between the jambs; and in the greater buildings, ſix and a half, or ſeven feet; and their heighth may be double the length at the leaſt.— But in high rooms or larger buildings, their heighth may be a third, a fourth, or half their breadth, more than double their length.

Such are the proportions for *windows* of the firſt ſtory; and according to theſe muſt thoſe in the upper ſtories be for breadth: but, as to heighth, they muſt diminiſh; the ſecond ſtory may be one third part lower than the firſt, and the third ſtory one fourth part lower than the ſecond. See BUILDING.

Architrave WINDOWS. See the article ARCHITRAVE.

Dormer WINDOWS, or *Lutherns*. See LUTHERN, &c.

Tranſom WINDOWS. See the article TRANSOM.

Scenography of WINDOWS. See the article SCENOGRAPHY.

WINDOW, in anatomy, *&c.* See FENESTRA.

WIND-TACKLE-*Blocks*, in a ſhip, are the main double blocks or pulleys; which, being made faſt to the end of a ſmall cable, ſerve for the hoiſting of goods into the ſhip, *&c.* See BLOCK, TACKLE, &c.

To wind, or wend a ſhip, ſignifies to bring her head about.

How winds, or wends the ſhip? is a queſtion aſked by mariners concerning a ſhip under ſail, ſignifying as much as, upon what point of the compaſs does ſhe lie with her head?

WIND-TAUGHT, a ſea-term, implying as much as, *ſtiff in the wind*. See TAUGHT.

Too much rigging, high maſts, or any thing catching or holding wind aloft, is ſaid to hold a ſhip *wind-taught*; by which they mean, that ſhe ſtops too much in her ſailing, in a ſtiff gale of wind.

Again, when a ſhip rides in a main ſtreſs of wind and weather, they ſtrike down her top-maſts, and bring her yards down, which elſe would hold too much wind, or be too much diſtended, and *wind-taught*.

WINDWARD *Tide*, in the ſea language, a tide which runs againſt the wind. See TIDE.

WINDY *Tumors*. See the article TUMOR.

WINE, *Vinum*, a briſk, agreeable, ſpirituous, and cordial liquor, drawn from vegetable bodies, and fermented. See VEGETABLE, and FERMENTATION.

The character of a *wine*, according to Boerhaave, is, that the firſt thing it affords by diſtillation, be a thin, oily, inflammable fluid; called a *ſpirit*. See SPIRIT.

This diſtinguiſhes *wines* from another claſs of fermented vegetable juices, *viz. vinegars*; which, inſtead of ſuch ſpirit, yield, for the firſt thing, an acid, un-inflammable matter. See VINEGAR.

All ſorts of vegetables, fruits, ſeeds, roots, *&c.* afford *wine*; as grapes, currants, mulberries, elder, cherries, apples, pulſe, beans, peaſe, turnips, radiſhes, and even graſs itſelf. See VINOUS.

Hence, under the claſs of *wines*, or vinous liquors, come not only *wines* abſolutely ſo called, but alſo ale, cider, *&c.* See MALT *Liquor*, ALE, CIDER, &c.

WINE is, in a more particular manner, appropriated to that which is drawn from the fruit of the vine, by ſtamping its grapes in a vat, or cruſhing and expreſſing the juice out of them in a preſs, and then fermenting, *&c.* See VINE, and VINEYARD.

The goodneſs of *wine* conſiſts in its being neat, dry, fine, bright, and briſk, without any taſte of the ſoil, of a clean ſteddy colour; having a ſtrength, without being heady; a body, without being ſour; and keeping, without growing hard, or eager.

Wine being a liquor moſtly of foreign produce; the divers names, forms, kinds, diſtinctions, *&c.* thereof, are borrowed from the countries where it is produced; the principal whereof, at this day, is France: to *wines* of which country, a good part of what we have to ſay of this noble liquor, will more immediately belong.

Wine, in France, is diſtinguiſhed, from the ſeveral degrees and ſteps of its preparation, into

Mere-goutte, mother-drop; which is the virgin *wine*, or that which runs of itſelf out of a tap of the vat wherein the grapes are laid, before the vintager enters to tread, or ſtamp the grapes.

Muſt, *ſurmuſt*, or *ſtum*; which is the *wine* or liquor in the vat, after the grapes have been trod, or ſtamped.

Preſſed WINE, *vin de preſſurage*, which is that ſqueezed with a preſs out of the grapes half bruiſed by the treading.

The huſks left of the grapes, are called *rape*, *murk*, or *mark*; by throwing water upon which, and preſſing them a-freſh, they make a liquor for ſervants uſe, anſwerable to our cyderkin, and called *boiſſon*; which is of ſome uſe in medicine, in the cure of diſorders occaſioned by viſcid humours.

Sweet WINE, *vin doux*, is that which has not yet worked, or fermented.

Bouru, that which has been prevented working, by caſting in cold water.

Cuvé, or *worked wine*; that which has been let work in the vat, to give it a colour.

Cuit, or *boiled wine*; that which has had a boiling ere it worked; and which, by that means, ſtill retains its native ſweetneſs.

Paſſe, or *ſtrained wine*, that made by ſteeping dry grapes in water, and letting it ferment of itſelf.

Wines are alſo diſtinguiſhed, with regard to their colour, into *white wine*, *red wine*, *claret wine*, *pale wine*, *roſe*, or *black wine*.— And, with regard to their country, or the ſoil that produces them, into *French wines*, *Spaniſh wines*, *Rheniſh wines*, *Hungary wines*, *Greek wines*, *Canara wines*, &c.— And more particularly into *Port wine*, *Madera wine*, *Burgundy wine*, *Champaign wine*, *Falernian wine*, *Tokay wine*, *Schiras wine*, &c.

Wines, again, are diſtinguiſhed, with regard to their quality, into *ſweet wines*, *rough* or *dry wines*, and *rich* or *luſcious wines*, *vins de liqueur*; of which laſt, ſome are exceedingly ſweet, others ſweet and poignant: all chiefly uſed by way of dram after meals, *&c.*

Such are French *Frontigniac*, *Madera*, the *Canary*, the *Hungary*, *Tokay*, the Italian *Monteſiaſcone*, the Perſian *Schiras*, the *malmſey wines* of Candia, Chio, Leſbos, Tenedos, and other iſlands of the Archipelago, which anciently belonged to the Greeks, but now to the Turks.— Theſe are ſometimes called *Greek wines*, and ſometimes *Turky wines*.

Wine is alſo variouſly denominated, according to its ſtate, circumſtances, qualities, *&c.*

Natural WINE, is ſuch as comes from the grape, without further mixture, or ſophiſtication.

Brewed, or *adulterated* WINE, is that wherein ſome drug is added to give it a ſtrength, fineneſs, flavour, briſkneſs, ſweetneſs, or ſome other quality which is wanted.

Pricked, or *eager* WINE, is that turned ſouriſh.

Flat WINE, is that fallen weak and vappid, for want of being drank in time.

Sulphured WINE, is that put in caſks wherein ſulphur has been burnt; in order to fit it for keeping, or for carriage by ſea. See SULPHUR.

Colour WINE, is ſome thick *wine*, of a very deep colour, ſerving to dye the *wines*, that are too pale, *&c.* as the *black wine*, in uſe among our vintners.

Chip WINE, is that poured on chips of beech wood, to fine, or ſoften it.

Rape WINE, is that put in a caſk half full of freſh grapes picked for the purpoſe, to recover the ſtrength, briſkneſs, *&c.* it had loſt by keeping, *&c.*

Burnt WINE, is that boiled up with ſugar; and ſometimes with a little ſpice. See HIPPOCRAS.

There is alſo a ſort of *Malmſey wine*, made by boiling of muſcadine. See MALMSEY.

Method of making and fining WINE.— In the ſouthern parts of France, their way is, for *red wines*, to tread, or ſqueeze the grapes between the hands, and to let the whole ſtand, juice and huſks, till the tincture be to their liking: after which they preſs it.— But for *white wines*, they preſs the grapes immediately.

When preſſed, they tun the muſt, and ſtop up the veſſel; only leaving the depth of half a foot or more empty, to give room for it to work.— At ten days end, they fill this ſpace with ſome other proper *wine*, that will not provoke it to work again.— This they repeat from time to time; new *wine* ſpending itſelf a little ere it come to perfection.

About Paris, and the northern parts of France, they let the murk and muſt ſtand two days and nights for *white wines*, and at leaſt a week for *claret wines*, ere they tun it. — While it continues working, it is kept as warm as poſſible.

Some, upon ſtopping it up for good and all, roll the caſk about the cellar, to mix the liquor with the lees; and, after ſettling a few days, rack it off with great improvement.

To fine it down, they put ſhavings of green beech into the veſſel; having firſt taken off all the rind, and boiled them an hour in water, to extract their rankneſs; and afterwards dried them in the ſun, or an oven: a buſhel of theſe ſerve for a tun of *wine*. Theſe put the liquor in a gentle working, and purify it in twenty-four hours. They alſo give an agreeable flavour.— The ſame chips being waſhed, ſerve again and again, till almoſt quite conſumed.

Some ſweeten their *wines* with raiſins of the ſun, trod in the vat with the grapes, having been firſt plumped by boiling: others, by boiling half the muſt, ſcumming it, and tunning it up hot with the other.

For Engliſh *wine*, the method recommended by Mr. Mortimer, is, firſt, to gather the grapes when very dry, to pick them from the ſtalks, then to preſs them, and let the juice ſtand twenty-four hours in the vat covered. Afterwards, to draw it off from the groſs lees, and then put it up in a caſk, and to add a pint or quart of ſtrong red or white port to every gallon of juice; and let the whole work: bunging it up cloſe, and letting it ſtand till January; then bottle it in dry weather.

By this method, he aſſures us, he has made Engliſh *wine* as good as any the beſt and pureſt French *wine*, drank either in Paris, or Champaign.

Mr. Bradley chuſes to have the liquor, when preſſed, ſtand with the huſks, ſtalks and all, in the vat to ferment for fifteen days.

He adds, that, according as the vines have been managed, the *wine* will be ſtronger or weaker.— Thoſe, *e. gr.* which run at liberty up high trees, and are never pruned, make the ſmalleſt *wines:* thoſe kept tied to ſtakes about four feet high, and which have their branches duly pruned, ſtronger *wines:* and thoſe neareſt the ground, the ſtrongeſt.

The force of the fermenting *wine* is very great; being able, if cloſe ſtopped up, to burſt through the ſtrongeſt caſk.— The readieſt and only way to ſtop or abate the fermentation, is by the fume of burning ſulphur.

Add, that when *wine* already made is upon the fret, or, by any alteration in the air, begins to ferment again; the way uſed by the vintners and wine-coopers to ſave it, is by the flame of common ſulphur, or a lighted match dipped in it; which, held under a caſk juſt ready to burſt its hoops, calms its fury, and makes it immediately ſubſide. See SULPHUR.

Piece of WINE.	See the article	PIECE.
Priſage of WINE.		PRISAGE.
Racking of WINE.		RACK.
Spirit of WINE.		SPIRIT.
Stooming of WINE.		STOOMING.

The uſes of WINE are very great; not only as a drink, but as a medicine. See DRINK, &c.— Several phyſicians recommend it as an excellent cordial, and particularly ſerviceable in fevers, the lues venerea, &c.

Pliny mentions Staphylus as the firſt who mixed *wine* with water; but Athenæus gives the credit thereof to Amphitryon king of Athens.— On this occaſion a fable was invented; that Bacchus having been ſtruck with a thunderbolt, and being all inflamed, was preſently caſt into the nymph's bath, to be extinguiſhed.

The age of WINE is properly reckoned by leaves.— Thus, they ſay, *wine* of two, four, ſix leaves, to ſignify a *wine* of ſix, four, or two years old; taking each new leaf put forth by the vine, ſince the *wine* was made, for a year.

Among the Romans, the age of *wines* was, as it were, the criterion of their goodneſs.— Horace, in his *Odes*, which one may call *Bacchic ſongs*, boaſts of his drinking Falernian *wine*, born, as it were, with him, or which reckoned its age from the ſame conſuls.

Pliny mentions *wines* kept above a hundred years, and yet potable.— Others he ſpeaks of kept two hundred years, which, by that time, were reduced to the conſiſtence of honey.

But the moderns keep no *wines* to any ſuch age.— Where they are kept the longeſt, as in Italy and Germany, there are ſcarce any to be found above fifteen leaves.— In France, the *wines* that keep beſt, are thoſe of Dijon, Nantz, and Orleans, and are reckoned ſuperannuated at five or ſix leaves old.

Lees of WINE, are the impurities thereof, or the thick ſediment, remaining at the bottom of the caſks, when the *wine* is drawn out. See LEES, and VINEGAR.

WINE is alſo a denomination, applied in medicine and pharmacy, to divers mixtures or compoſitions, wherein the juice of the grape is a principal ingredient. See VINUM.

Theſe medicated *wines* make a conſiderable article in our diſpenſatories, in quality of diet-drinks; ſome being denominated from the ingredients uſed in them; ſome from the intentions wherewith they are preſcribed; and ſome from their qualities, &c.

Bitter WINE, *vinum amarum*, is an infuſion of certain bitter ſtomachic herbs, as gentian root, juniper-berries, tops of centaury, orange and lemon peel, in white port, or other white *wine*; taken by way of whet in a morning, to reſtore the palled ſtomach after a debauch, and bring the fibres to their due tenſion.

Chalybeate, or *Steel* WINE, is prepared of ſteel-filings, and ſaffron infuſed and filtered.— It is good for removing obſtructions in the viſcera, as in the chloroſis, &c.

Vinum benedictum, the *bleſſed* WINE, is made of crocus metallorum, and mace, infuſed in *wine*.— It was formerly a celebrated emetic, but now almoſt out of uſe for its roughneſs.

Elecampane WINE, *vinum enulatum*, is an infuſion of the root of that plant, with ſugar and currants, in white port.— It cleanſes the viſcera, prevents diſorders and obſtructions of the lungs, and is good in aſthmatic caſes, cachexies, &c.

Hog-lice WINE, *vinum millepedum*, is prepared of hog-lice put alive in white port; and after ſome infuſion, preſſed and ſtrained out: to the liquor is added ſaffron, ſalt or ſteel, &c. — It is recommended againſt the jaundice, dropſy, cachectic habits, &c. See MILLEPEDES.

Pectoral WINE, *vinum pectorale*, is prepared of liquorice, ſaffron, coriander-ſeeds, carraway, aniſe, ſalt of tartar, pennyroyal, and hyſſop waters, digeſted with canary *wine*, and ſtrained.— It is a good expectorant, helping to deterge and cleanſe the lungs, &c.

Emetic WINE, *vinum emeticum*. See the article EMETIC.

Hippocrates's WINE, *vinum Hippocraticum*, or *Hippocras*. See HIPPOCRAS.

Viper WINE, *vinum viperinum*, is a preparation of female vipers, infuſed ſix months in canary *wine*.— It is a great reſtorative, and provokes to venery; good againſt cutaneous eruptions, &c.

Vinum Scilliticum, WINE *of Squills*, is an infuſion of thoſe onions in white *wine* for forty days; after which the ſquills are ſtrained out, and the liquor preſerved for uſe.— It is a gentle emetic, good againſt inundations of rheum, &c. See SCILLÆ.

WINE-*Meaſure*. See the article MEASURE.

WING. See the articles FEATHER, and FLYING.

Warbling of the WINGS. See the article WARBLING.

WINGS, in heraldry, are born ſometimes ſingle, ſometimes in pairs, in which caſe they are called *conjoined*; when the points are downward, they are ſaid to be *inverted*; when up, *elevated*. See VOL.

WING, *Ala*, or *Axilla*, in botany, the angle which the leaves of a plant, or the pedicles of the leaves, form with the ſtem, or a branch of the plant. See LEAF.

This angle is commonly acute, and always turned upward.— It has its name from its reſembling the angle which the *wings* of a bird form with the body; or, rather, from the angle which a man's arms make with his trunk, which is alſo called *ala*, wing. See AXILLA.

WINGS, in gardening, &c. denote ſuch branches of trees, or other plants, as grow up aſide of each other. See BRANCH.

La Quintiny ſays, the term is particularly applied to artichoaks, whoſe *wings*, or *alæ*, are the leſſer heads or fruits that grow up with the principal one, on the ſame ſtalk.

WINGS, *alæ*, in the military art, are the two flanks or extremes of an army, ranged in form of battle; being the right and left ſides thereof, and including the main body. See ARMY, BATTALION, &c.

The cavalry are always poſted in the *wings*; *i. e.* on the flanks, or the right and left ſides of each line; to cover the foot in the middle. See LINE, and FLANK.

Pan, one of Bacchus's captains, is ſaid to have been the firſt inventor of this method of ranging an army; whence, ſay they, it is that the antients painted him with horns on his head; what we call *wings*, being by them called *cornua*, horns. See PANIC.

This, at leaſt, is certain, that the method of arranging in *wings* is very antient.— The Romans, we know, uſed the term *alæ*, or *wings*, for two bodies of men in their army; one on the right, the other on the left, conſiſting each of 400 horſe, and 4200 foot uſually, and wholly made up of confederate troops.— Theſe were deſigned to cover the Roman army, as the *wings* of a bird cover its body.

The troops in theſe *wings* they called *alares*, and *alares copiæ*; and we at this day diſtinguiſh our armies into the *main-body*, the *right* and *left wings*.

WINGS are alſo uſed for two files that terminate each battalion, or ſquadron, on the right and left.— The pikes are ranged in the middle, and the muſqueteers in the *wings*.

WINGS, in fortification, denote the longer ſides of horn-works, crown-works, tenailles, and the like outworks; including the ramparts, and parapets, with which they are bounded on the right and left, from the gorge to their front.

Theſe *wings*, or ſides, are capable of being flanked, either with the body of the place, if they ſtand not too far diſtant;

or with certain redoubts; or with a traverſe made in their ditch.

S. *Michael's* WING, is the name of a military order in Portugal, inſtituted, according to the jeſuit Mendo, in 1165; or according to di Michieli, in his *Teſoro Militar de Cavalleria*, in 1171. Its inſtitutor was, Alphonſus Henry I. king of Portugal; and the occaſion was a victory gained by him over the king of Sevil, and his Saracens; for which he thought himſelf beholden to S. Michael, whom he had choſe for his patron in the war againſt the infidels.

The banner they bore was a *wing* reſembling that of the arch-angel, of a purple colour, encompaſſed with rays of gold.— Their rule was that of S. Benedict; the vow they made was to defend the Chriſtian religion, and the borders of the kingdom, and to protect orphans.— Their motto, *Quis ut Deus.*

WINGED, in botany, a term applied to ſuch ſtems of plants as are furniſhed, all their length, with a ſort of membranous leaves. See STALK, STEM, &c.

Several kinds of thiſtles have *winged* ſtalks, and branches. See THISTLE, &c.

WINGED *Leaves*, are ſuch as conſiſt of divers little leaves, ranged in the ſame direction, ſo as to appear no more than one and the ſame leaf.— Such are the leaves of agrimony, acacia, aſh, *&c.* See LEAF.

WINGED *Seeds*, are ſuch as have down or hairs on them; whereby the wind taking hold, blows them to a diſtance. See SEED, and SEMINATION.

WINGED *Stalk*. See the article STALK.

WINGED, in heraldry, is applied to a bird, when its *wings* are of a different colour, or metal, from the body.

Winged is alſo applied to any thing repreſented with *wings*, though contrary to its nature; as a *winged*, or *flying hart*, &c.

WINNOW, ſignifies *to fan*, or ſeparate corn from the chaff by wind.

WINTER, one of the four ſeaſons, or quarters of the year. See SEASON, &c.

Winter commences on the day when the ſun's diſtance from the zenith of the place is the greateſt, and ends on the day when its diſtance is at a mean between the greateſt and leaſt. See SUN.

Notwithſtanding the coldneſs of this ſeaſon, it is proved, in aſtronomy, that the ſun is really nearer to the earth in *winter* than in ſummer.— The reaſon of the decay of heat, *&c.* ſee under the articles HEAT, LIGHT, &c.

Under the equator, the *winter*, as well as the other ſeaſons, return twice every year; but all other places have only one *winter* in the year; which, in the northern hemiſphere, begins when the ſun is in the tropic of Capricorn; and in the ſouthern hemiſphere, when in the tropic of Cancer: ſo that all places in the ſame hemiſphere have their *winter* at the ſame time. See TROPIC.

WINTER, among printers, that part of the printing-preſs, ſerving to ſuſtain the *carriage*, &c. See PRINTING-*Preſs*.

WINTER'*s Bark*, *Cortex* WINTERI, or WINTERANUS. See CORTEX, and CINNAMON.

WINTER-*Quarters*. See the article QUARTERS.

WINTER-*Rig*, amongſt huſbandmen, ſignifies to *fallow*, or till the land in *winter*. See FALLOW, &c.

WINTER-*Solſtice*. See the article SOLSTICE.

WINTONIÆ *Rotulus*. See the article ROTULUS.

WIRE, WIAR, WIER, or WYRE, a piece of metal, drawn through the hole of an iron, into a thread, of a fineneſs anſwerable to the hole it is paſſed through. See IRON.

Wires are frequently drawn ſo fine, as to be wrought along with other threads of ſilk, wool, or hemp: and thus they become a conſiderable article in the manufactures.

The metals moſt commonly drawn into *wire* are gold, ſilver, copper, and iron.— And hence we have *gold wire*, *ſilver wire*, *iron wire*, &c. as in the following articles.

Gold and ſilver WIRE.— What we call *gold wire*, is made of cylindric ingots of ſilver, covered over with a ſkin of gold; and thus drawn ſucceſſively through a vaſt number of holes, each ſmaller and ſmaller, till at laſt it is brought to a fineneſs exceeding that of a hair.

That prodigious ductility which makes one of the diſtinguiſhing characters of gold, is no where more conſpicuous than in this gilt *wire*.— A cylinder of 48 ounces of ſilver, covered with a coat of gold, only weighing one ounce, Dr. Halley informs us, is commonly drawn into a *wire*, two yards of which only weigh one grain: whence 98 yards of the *wire* only weigh 49 grains; and one ſingle grain of gold covers the ſaid 98 yards.— So that the ten thouſandth part of a grain is above half an inch long.

The ſame author, computing the thickneſs of the ſkin of gold, found it to be only $\frac{1}{134500}$ part of an inch— yet ſo perfectly does it cover the ſilver, that even a microſcope does not diſcover any appearance of the ſilver underneath.

M. Rohault obſerves, that a like cylinder of ſilver covered with gold, 2 feet 8 inches long, and 2 inches 9 lines in circumference, is drawn into a *wire* 307200 feet long; *i. e.* into 115200, its former length.

Mr. Boyle relates, that 8 grains of gold covering a cylinder of ſilver, is commonly drawn into *wire* thirteen thouſand feet long. See GOLD.— The method of drawing it, ſee further illuſtrated under the article DUCTILITY.

Silver WIRE is the ſame with gold *wire*, except that the latter is gilt, or covered with gold, and the other is not. See SILVER.

There are alſo counterfeit gold and ſilver *wires*: the firſt made of a cylinder of copper, ſilvered over, then covered with gold; and the ſecond of a like cylinder of copper ſilvered over, and drawn through the iron, after the ſame manner as gold and ſilver *wire*.

Braſs WIRE is drawn after the ſame manner as the former. — Of this, there are divers ſizes, ſuited to the divers kinds of works. The fineſt is uſed for the ſtrings of muſical inſtruments, as ſpinets, harpſichords, manichords, *&c.* See CHORD.

The pinmakers likewiſe uſe vaſt quantities of *wire* of ſeveral ſizes, to make their pins of. See PIN.

Iron WIRE, is called, by the French, *fil d'archal*; the reaſon of which, their authors are not agreed about.— That celebrated etymologiſt, M. Menage, derives it from *filium & aurichalcum*; but others, more converſant in the commerce thereof, deduce it from one Richard Archal, the firſt inventor thereof.

There are various ſizes of this *wire*, from $\frac{1}{2}$ an inch, to $\frac{1}{10}$ of an inch diameter. The ſmalleſt ſizes are uſed to ſtring muſical inſtruments withal, particularly harpſichords, pſalteries, *&c.*— Vaſt quantities of *iron-wire* are brought yearly from the Baltic; partly ſpent at home, and part exported to France, *&c.*

WIRE-*Drawing*.— For the ſeveral manners of drawing gold and ſilver, ſee GOLD, SILVER, DUCTILITY, &c.

The firſt iron that runs from the ſtone, when melting, being the ſofteſt, and tougheſt, is preſerved to make *wire* of. See IRON.

WISDOM, *Sapience*, uſually denotes a higher and more refined knowledge of things, immediately preſented to the mind, as it were by intuition, without the aſſiſtance of ratiocination. See KNOWLEDGE, DISCOURSE, SCIENCE, &c.

In this ſenſe, *wiſdom* may be ſaid to be a faculty of the mind, or at leaſt a modification and habit thereof. See FACULTY, MODIFICATION, HABIT, &c.

Sometimes the word is more immediately uſed in a moral ſenſe, for what we call *prudence* or *diſcretion*; which conſiſts in the ſoundneſs of the judgment, and a conduct anſwerable thereto. See JUDGMENT.

The ſchool-divines, ſometimes reſtrain *wiſdom* to the knowlede of the more ſublime and remote objects, as that of God, *&c.* In which ſenſe, theology is properly ſaid to be *wiſdom*.

The Latin word for *wiſdom*, is *ſapientia*, which literally expreſſes the ſenſe of taſting; to which *wiſdom* is ſuppoſed to have ſome conformity.— The ſight, and other ſenſes, only preſent to us the ſurface of things: taſte goes deeper, penetrates into the ſubſtances; ſo that what, *e. gr.* to the feeling ſeemed cold, to the taſte ſhall be found hot: ſo *wiſdom*, ariſing from a deep attention to our ideas, goes further, and frequently judges otherwiſe than the common apprehenſions of men would reach to. See UNDERSTANDING, REASON, &c.

WIST, WISTA, a quantity, or meaſure of land among our Saxon anceſtors; of different dimenſions, in different places. — In the *Monaſticon*, it is ſaid to be half a hide, or ſixty acres: in an old chronicle of the monaſtery of Battle, it is ſaid to be forty-eight acres. See HIDE, &c.

WIT, a faculty of the mind, conſiſting, according to Mr. Locke, in the aſſembling, and putting together of thoſe ideas with quickneſs and variety, wherein can be found any reſemblance or congruity; whereby to make up pleaſant pictures, and agreeable viſions to the phantaſy. See FACULTY, and IMAGINATION.

This faculty, the ſame great author obſerves, is juſt the contrary of *judgment*, which conſiſts in the ſeparating carefully from one another, ſuch ideas wherein can be found the leaſt difference, thereby to avoid being miſled by ſimilitude, and, by affinity, to take one thing for another. See JUDGMENT.

It is the metaphor, and alluſion, wherein, for the moſt part, lies the entertainment and pleaſantry of *wit*; which ſtrikes ſo lively on the fancy, and is therefore ſo acceptable to all people, becauſe its beauty appears at firſt ſight, and there is required no labour of thought, to examine what truth or reaſon there is in it.— The mind, without looking any further, reſts ſatisfied with the agreeableneſs of the picture, and the gaiety of the imagination; and it is a kind of affront to go about to examine it by the ſevere rules of truth, or reaſon.— Whence it ſhould ſeem, that *wit* conſiſts in ſomething that is not perfectly conformable to them. *Eſſay on Hum. Underſt.* Lib. I. cap. 11.

WIT is alſo an appellation, given to perſons poſſeſſed of the faculty called *wit*, *eſprit*.

A French author, who, in 1695, publiſhed a treatiſe *of wit*, *du bel eſprit*, lays down four characteriſtics thereof.—

1°. A man, who, with an open air, and eaſy motions, affects thoſe he converſes withal agreeably; and on any ſubject that preſents itſelf, advances new thoughts, and adorns them with a ſpritely turn; is, all the world over, a *wit*.

2°. Another, who, leſs ſolicitous about the choice and delicacy of his ſentiments, knows how to make himſelf valued by I know not what elevation of diſcourſe; who draws a deal of attention, and ſhews a deal of vivacity in his ſpeaking, and readineſs in his anſwers, is likewiſe acknowledged a *wit*.

3°. A third, who takes leſs care about thinking, than about ſpeaking well; who affects fine words, though perhaps low and poor in matter; who pleaſes by any eaſy pronunciation, and a certain tone of voice, is placed in the ſame rank.

4°. Another, whoſe chief aim is not to make himſelf eſteemed, ſo much as to raiſe mirth and laughter: who jokes pertinently, rallies pleaſantly, and finds ſomething to amuſe himſelf withal in every pretty ſubject, is likewiſe allowed a *wit*.

Yet, it may be obſerved, that in all theſe caſes, there is nothing of real *wit*, as above defined; but the whole is *imagination*, or *memory* at moſt: nay, the whole is no more than temperament may give.

A true *wit* muſt have a juſt faculty of diſcernment; muſt have, at the ſame time, both a deal of energy, and of delicacy in his ſentiments; his imagination muſt be noble, and withal happy and agreeable; his expreſſions polite and well turned; without any thing of parade or vanity in his diſcourſe, or his carriage.— It is not at all eſſential to a *wit*, to be ever hunting after the brilliant; ſtill ſtudying fine thoughts, and affecting to ſay nothing but what may ſtrike and ſurprize.

This is a fault very frequent in dramatic perſons: the duke of Buckingham rallies it very juſtly.—

" What is that thing which we *ſheer wit* do call?
" 'Tis when the *wit* of ſome great writer ſhall
" So overflow, that is, be none at all;
" That even his fools ſpeak ſenſe.—

Humour, ſay our critics, is the genuine *wit* of comedy. See HUMOUR, COMEDY, &c.

Child-WIT. See the article CHILD-*Wite*.

WITCHCRAFT, the crime of ſorcery, eſpecially in women. See SORCERY, and MAGIC.

There may, perhaps, be ſome foundation for what we call *faſcination*, and *witchcraft*.— We have infinite inſtances, and hiſtories to this purpoſe; which it were not fair to ſet aſide, merely becauſe they are not reconcileable to our philoſophy: but, as it happens, there ſeems to be ſomething in philoſophy to countenance them. See FASCINATION.

All living things, we know, emit effluvia, both by the breath, and the pores of the ſkin.— All bodies, therefore, within the ſphere of their perſpiratory, or expiratory effluvia, will be affected by them; and that, in this or another manner, according to the quality of the effluvia; and in this or that degree, according to the diſpoſition of the emittent, and recipient parts. See EFFLUVIA.

Thus far is inconteſtable; nor need we produce inſtances of animals exhaling ſweet, or ſtinking ſmells; or of infectious diſeaſes conveyed by effluvia, *&c.* in confirmation thereof.

Now, of all parts of an animal body, the eye, we know, is the quickeſt.— It moves with the greateſt celerity, and in all the variety of directions.— Again, its coats and humours are as permeable as any other part of the body, (witneſs the rays of light it ſo copiouſly receives).— The eye, therefore, no doubt, emits its effluvia like the other parts.— The fine humours of the eye muſt be continually exhaling.— The heat of the pervading rays will rarefy and attenuate them: and that, with the ſubtile juice, or ſpirit of the neighbouring optic nerve, ſupplied, in great abundance, by the vicinity of the brain, muſt make a fund of volatile matter to be diſpenſed, and, as it were, determined by the eye.

Here, then, we have both the dart, and the hand to fling it. — The one furniſhed with all the force and vehemence, and the other with all the ſharpneſs and activity, one would require. No wonder if their effects be great!

Do but conceive the eye as a ſling, capable of the ſwifteſt and intenſeſt motions and vibrations: and, again, as communicating with a ſource of ſuch matter, as the nervous juice elaborated in the brain; a matter ſo ſubtile and penetrating, that it is ſuppoſed to fly inſtantaneouſly through the ſolid capillaments of the nerves; and ſo active and forcible, that it diſtends and convulſes the muſcles, and diſtorts the limbs, and alters the whole habitude of the body, giving motion and action to a maſs of inert, inactive matter. – A projectile of ſuch a nature, flung by ſuch an engine as the eye, muſt have an effect wherever it ſtrikes: and the effect will be limited and modified by the circumſtances of diſtance, the impetus of the eye, the quality, ſubtility, acrimony, *&c.* of the juices, and the delicacy, coarſeneſs, *&c.* of the object it falls on.

This theory, we are of opinion, may account for ſome of the phænomena of witchcraft, particularly of that branch called *faſcination*.— It is certain the eye has always been eſteemed the chief ſeat, or rather organ of *witchcraft*; though, by moſt, without knowing why, or wherefore: The effect was apparently owing to the eye; but how was not dreamed of.— Thus, the phraſe, to have an *evil eye*, imports as much as to be a *witch*.— And hence Virgil— *Neſcio quis teneros oculus mihi faſcinat argos*.— Again, old, bilious perſons, are thoſe moſt frequently ſuppoſed to have the faculty; the nervous juice in them being depraved, and irritated by a vicious habitude of body; and ſo rendered more penetrating, and malignant.— And young perſons, chiefly children and girls, are moſt affected by it; by reaſon their pores are patent, their juices incoherent, and their fibres delicate, and ſuſceptible. Accordingly, the *witchcraft* mentioned by Virgil, only reaches to the tender lambs.— Laſtly, the faculty is only exerciſed when the perſon is diſpleaſed, provoked, irritated, *&c.* It requiring ſome extraordinary ſtreſs, and emotion of mind, to dart a proper quantity of the effluvia, with a ſufficient impetus, to produce the effect at a diſtance.

That the eye has ſome very conſiderable powers, is paſt diſpute.— The antient naturaliſts aſſure us, that the baſiliſk, and opoblepa, kill other animals merely by ſtaring at them.

If this fail of credit; a late author aſſures us to have ſeen a mouſe running round a large toad, which ſtood looking earneſtly at it, its mouth open: ſtill the mouſe made leſs and leſs circles about it; crying all the while, as if compelled thereto; and, at laſt, with a deal of ſeeming reluctance, ran into the gaping mouth, and was ſtreight ſwallowed.

Who has not obſerved a ſetting-dog; and the effects of its eye on the partridge? The poor bird, when once its eyes meet thoſe of the dog, ſtands as if confounded, regardleſs of itſelf, and eaſily lets the net be drawn over it.— We remember to have read of ſquirrels ſtupified, and overcome by a dog's ſtaring hard at them, and thus made to drop out of their trees into his mouth.

That man is not ſecure from the like affections, is matter of eaſy obſervation. Few people but have, again and again, felt the effects of an angry, a fierce, a commanding, a diſdainful, a laſcivious, an intreating eye, *&c.*— Theſe effects, no doubt, are owing to the different ejaculations from the eye; and are a degree of *witchcraft*. See PHYSIOGNOMY.

WITENA-*Mot*, or WITENA-*Gemot*, among our Saxon anceſtors, a term literally ſignifying council, or aſſembly of ſages, or wiſe men; applied to the great council of the land, of latter days called *parliament*. See PARLIAMENT.

WITHERNAM*, in law, a repriſal, or taking of other goods or cattle, in lieu of thoſe unjuſtly taken and eſſoined, or otherwiſe with-holden.

* The word is compounded of the Saxon ƿiðeꞃ, *contra*, againſt, and *nam captio*, taking. See NAM.

Where goods are taken by colour of diſtreſs, and driven to an hold, or out of the county; ſo that the ſheriff cannot, upon replevin, make deliverance thereof to the party diſtrained: in this caſe the writ of *withernam*, or *de vetito namio*, is iſſued, directed to the ſheriff, for the taking as many of the party's beaſts, as he did thus unlawfully reſtrain; or as much goods of his, till he had made deliverance of the firſt diſtreſs. See DISTRESS, REPLEVY, &c.

Homine capto in WITHERNAMIUM. See HOMINE.

WITHERS *of an horſe*, the juncture of the ſhoulder-bones at the bottom of the neck and main, towards the upper part of the ſhoulder. See HORSE.

WITNESS, *Teſtis*, a perſon who certifies, or aſſerts the truth of any fact. See EVIDENCE.

Among the Romans, it was a cuſtom to pull or pinch the ears of *witneſſes* preſent at any tranſaction; that they might remember it when they were called to give in their teſtimony.

Two eye-*witneſſes*, or *de viſu*, not ſuſpected, are deemed a concluſive proof. See TESTIMONY, PROOF, CERTITUDE, &c.

Falſe *witneſſes*, ſuborners of *witneſſes*, &c. in England, are puniſhed with the pillory; in ſeveral other countries, with death. See PERJURY, SUBORNATION, &c.

In a ſynod at Rome, under Conſtantine, in the year 320, it was decreed, that there ſhould be 72 *witneſſes* heard, to condemn a biſhop; which was called *libra teſtium*, a pound of *witneſſes*. Accordingly there were 72 *witneſſes* heard againſt Pope Marcellinus; who, ſays the hiſtorian, *erant electi libra occidua*. See OATH, PURGATION, &c.

Antiently there were ſynodal *witneſſes*, *teſtes ſynodales*, in each pariſh, choſe by the biſhop, to enquire into the hereſies, and other crimes of the pariſhioners; and to make oath thereof on the relics of the ſaints. See SYNODALES.

Attic WITNESS. See the article ATTIC.

WOAD, *Guadum*, or *Glaſtum*, a drug uſed by the dyers, to give a blue colour. See BLUE, and DYING.

It ariſes from a ſeed, ſown annually in the ſpring; which puts forth a plant called *glaſtum ſativum*, whoſe leaves reſemble thoſe of ribwort-plantain.— They have uſually three, four, or five crops of leaves every year; but only the two or three firſt are of any value; whereof the firſt is beſt, and the reſt in their order.

When the leaves are ripe, they crop or gather them; after which, they carry them to a woad-mill to grind them ſmall: after which, they are laid eight or ten days in piles or heaps; and at laſt made into a kind of balls, which are laid in the ſhade, on hurdles, to dry.

This done, they break or grind them to powder; and when ground, ſpread it on a floor, and water it, which they call *couching*.

Here they let it ſmoke and heat, till, by torrifying it every day, it becomes quite dry, which they call *ſilvering*. A week after which, it is in a condition to be uſed in dying.

The antient Britons uſed to dye their bodies herewith; and ſome hold, that it was from this plant, glaſs took its denomination; though others derive both *glaſs*, and *glaſtum*, from the Britiſh *glas*, which, to this day, denotes a blue colour. See GLASS.

A *woad blue*, is a very deep blue, almoſt black; and is the baſe of ſo many ſorts of colours, that the dyers have a ſcale, whereby they compoſe the divers caſts or degrees of *woad*, from the brighteſt to the deepeſt. See DYING.

WOLD*, ſignifies a plain down, or open champain-ground, hilly, and void of wood.

* Hence the names, Stow in the *Wold*, and *Cotſwold* in Glouceſterſhire; whence alſo that part of Leiceſterſhire, which lies northward beyond the Wrekin, is called the *Wold of Leiceſterſhire*.

WOLD, or WELD, among dyers. See the article WELD.

WOLFESHEAD*, or WULVESHEAD, *Caput lupinum*, denoted the condition of thoſe out-lawed for criminal matters in the Saxons time, and not yielding themſelves to juſtice. — For if they could have been taken alive, they muſt have been brought to the king; and if they, for fear of being apprehended, did defend themſelves, they might be ſlain, and their heads brought to the king; for their head was no more to be accounted of than a *wolf's head*. *LL. Edw.* in *Lamb.* fol. 127. and *Bract.* Lib. III. Tract. 2. cap. 11. See UTLAWRY.

* The word is originally Saxon, ƿulꝼeꞅ-heaꝼoꝺ, compounded of ƿulꝼ, *wolf*, and heaꝼoꝺ, *head*

WOLVES *Teeth*, of an horſe, are over-grown grinders, the points of which being higher than the reſt, prick their tongue and gums in feeding, ſo as to hinder the chewing of their meat.

They are ſeldom met with in young horſes; but if the teeth be not daily worn by chewing, they will grow up even to pierce the roof of the mouth. See TOOTH.

Rout of WOLVES. See the article ROUT.

WOMAN, FOEMINA, *Mulier*, the female of man. See FEMALE, MALE, &c.

S. Auguſtin calls *women* the *devout ſex*: at leaſt this is the common opinion; though others rather think, that in the prayer uſually attributed to that father, and ſtill rehearſed in the Romiſh church to the holy virgin, the words *intercede pro devoto fœmineo ſexu*, are to be underſtood of *women* devoted, or conſecrated to God in religious houſes; which had been ſufficiently expreſſed by the words, *ora pro populo, interveni pro clero*. See SEX; ſee alſo RELIGIOUS, &c.

It is a popular tradition among the Mahometans, which obtains to this day, that *women* ſhall not enter paradiſe. See HEAVEN.

An anonymous author, about the cloſe of the ſixteenth century, publiſhed a little Latin diſſertation, to prove that *women* are not men; that is, are not reaſonable creatures: *diſſertatio perjucunda qua anonymus probare nititur* mulieres *homines non eſſe*. — He alſo endeavours to prove, what naturally follows from this principle, *viz.* that *women* ſhall not be ſaved; that there is no future life, or happineſs for them. His proofs are all taken from ſcripture, or founded on ſcripture.— Though, after all, his aim is not ſo much to degrade *women* to the condition of brutes; as to ridicule the principle or method of many Proteſtants, who, in points of controverſy, admit of no proofs or conſiderations, but what are taken from ſcripture alone.— This appears from the concluſion of the work.— *Probavi, opinor, invictiſſimis SS. Literarum teſtimoniis*, mulierem *non eſſe hominem, nec eam ſalvari: quod ſi non effeci, oſtendi tamen univerſo mundo quo modo hujus temporis hæretici, & præſertim Anabaptiſtæ, ſacram ſoleant explicare ſcripturam, & quo utantur methodo ad ſtabilienda ſua execranda dogmata.*

Yet, Simon Gediccus, a Lutheran divine, wrote a ſerious confutation of this piece in 1595; wherein the *women* are reſtored to the expectation of heaven, on their good behaviour.

The antient Marcionites allowed their *women* to baptize; as we are aſſured by S. Epiphanius, *Hær.* 42. c. 4.— The Montaniſts admitted *women* to the prieſthood, and even the epiſcopate. Epiph. *Hær.* 49. c. 2.— The modern Quakers alſo permit their *women* to preach and propheſy, on an equal footing with the men. See MARCIONITE, QUAKER, &c.

It is a point much controverted, how far learning and ſtudy become the ſex? —Eraſmus handles the queſtion at large in one of his letters to Budæus.— Lud. Vives, in his *Inſtitutio Fœminæ Chriſtianæ*, has a chapter expreſs on the ſame ſubject.— Madam Schurman, a German lady, has gone beyond them both, in a treatiſe on this problem; *Num Fœminæ Chriſtianæ conveniat ſtudium literarum?*

Several of the *women* remarkable for learning, have been alſo diſtinguiſhed for their want of conduct.— The reaſon, no doubt, lay in this; that their firſt ſtudies lying in books of gallantry and intrigue, the imagination was early turned that way, and the memory filled with a ſort of ideas, which a favourable diſpoſition, and age, adopted too eaſily, and improved too faſt.— It is not that ſtudy in itſelf has any natural tendency to produce ſuch effects; rather the contrary: The cloſe abſtracted reſearches of metaphyſics, logics, mathematics, phyſics, criticiſm, *&c.* no doubt, would be one of the ſureſt means to ſecure and eſtabliſh the virtue of continency in a *woman*.

A *woman*, in England, as ſoon as ſhe is married, with all her moveables, is wholly *in poteſtate viri*, at the will and diſpoſal of her huſband. See HUSBAND.

There are divers conſiderable things relating to *women* in the laws of England; which ſee under the article WIFE.

WOMB. See the article MATRIX.

Suffocation of the WOMB. See the article SUFFOCATION.

WONDER. See the article MIRACLE.

The *ſeven wonders of the world*, as they are popularly called, were, the *Egyptian pyramids*; the *mauſoleum*, erected by Artemiſia; the *temple of Diana* at Epheſus; the *walls* and *hanging gardens* of the city of Babylon; the *coloſſus*, or brazen image of the ſun at Rhodes; the *ſtatue of Jupiter Olympius*; and the *pharos*, or watch-tower, of *Ptolemy Philadelphus*. See PYRAMID, MAUSOLEUM, COLOSSUS, PHAROS, &c.

WONDERFUL *Water*. See the article WATER.

WOOD, *lignum*, a ſolid ſubſtance, whereof the trunks and branches of trees conſiſt; and deriving its growth from certain juices in the earth. See TRUNK, BRANCH, UNDERWOOD, &c.

The *wood* is all that part in a tree, included between the bark and the pith. See TREE, and BARK.

Dr. Grew, in his *Anatomy of Plants*, has diſcovered, by means of the microſcope, that what we call *wood* in a vegetable, notwithſtanding all its ſolidity, is only an aſſemblage of infinite minute canals, or hollow fibres; ſome of which riſe from the root upwards, and are diſpoſed in form of a circle; and the others, which he calls *inſertions*, tend horizontally from the ſurface to the centre; ſo that they croſs each other, and are interwove like the threads of a weaver's web. See VEGETATION, SAP, &c.

Woods are diſtinguiſhed into divers kinds, with regard to their natures, properties, virtues, and uſes.— Of *wood*, conſidered according to its qualities, whether uſeful, curious, medicinal, *&c.* the principal is that called *timber*, uſed in building houſes, laying floors, roofs, machines, *&c.* See TIMBER.

Woods valued on account of their curioſity, are *cedar*, *ebony*, *box*, *calambo*, &c. which, by reaſon of their extraordinary hardneſs, agreeable ſmell, or beautiful poliſh, are made into tables, combs, beads, *&c.* See EBONY, &c.

The *medicinal woods* are, *guaiac*, which the Spaniards call *ligno ſancto*; *aloes*, or *agallochum*; *ſaſſafras*, *nephriticum*, *ſantal*, *ſarſaparilla*, *aſpalathum*, *eagle wood* or *pao d'aquila*, &c. See ALOES, SASSAFRAS, &c.

Woods uſed in dying, are the *Indian wood*, *Brazil*, *Campeche*, &c. See BRASIL, INDIAN, &c.

Cord WOOD, denotes *wood* for the fire, generally made of the branches or loppings of trees, piled up in order.

This is limited to be below, ſeventeen inches, and above, ſix inches thick; and, at leaſt, three feet and a half long. See CORD.

Foſſil ſubterraneous WOOD.— There are divers places where *wood* is found under ground: whether overturned, and buried there from the time of the deluge, as many ſuppoſe; or whether formed and produced there, as jet is known to be. See SUBTERRANEOUS, FOSSIL, JET, &c.

Not long ago, there were found in England, above a hundred feet depth, ſeveral huge oaks, with all their branches on; and which, by their ſubterraneous ſituation, had contracted a black colour, nothing inferior to jet, joined with a hardneſs, which far ſurpaſſed that of any living oak.— It is hard to conceive how ſuch trees ſhould have come there, unleſs by a general ſubverſion of the whole terreſtrial globe at the flood. See DELUGE.

Mr. Boyle mentions a huge oak dug out of a ſalt-mine in Tranſilvania, ſo hard as not eaſily to be wrought on by iron tools; yet being expoſed to the air, out of the mine, became ſo rotten, that in four days it crumbled between the fingers. *Diſſert. de Admir. Hung.*— And Mr. Derham obſerves the ſame of the trees lately turned up by the breaches at Dagenham, *&c.* *Philoſ. Tranſ.* Nº 335. See MOSS.

Cutting in WOOD.	See the article	CUTTING.
Meaſure of WOOD.		MEASURE.
Painting on WOOD.		PAINTING.
Sculpture in WOOD.		SCULPTURE.
Stack of WOOD.		STACK.

WOOD, *Sylva*, in geography, a multitude of trees, extended over a large continued track of land, and propagated without culture. See FOREST.

The generality of *woods* only conſiſt of trees of one kind.— At Cape Verd in Africa, are *woods* of orange and lemon trees; in Ceylon, are *woods* of cinnamon trees; in the Molucca iſlands, *woods* of carraway trees; in the iſlands of Nero, Lontour, Loſgain, *&c.* *woods* of nutmeg trees; in Brazil, *woods* of brazil trees, *&c.* in Numidia, *woods* of date trees; in Madagaſcar, *woods* of tamarind trees, *&c.*

WOOD and *wood*, in the ſea language, is when two pieces of timber are ſo let into each other, that the *wood* of the one joins cloſe to the other.

WOOD-CORN, is a certain quantity of oats, or other grain antiently given by cuſtomary tenants to their lord, for the liberty to pick up dead or broken *wood*.

WOOD-GELD, WOODGELDUM, in our antient cuſtoms, the gathering or cutting of *wood* within the foreſt.— Or it may denote the money paid for the ſame to the foreſters. Sometimes it alſo ſeems to ſignify an immunity from this payment, by the king's grant.— Crompton ſays expreſly, it ſignifies to be free from the payment of money for taking of *wood* in a foreſt. See GELD.

WOOD-HAY, an antient cuſtom at Exeter; whereby a log out of every ſeam of *wood* brought over Ex bridge, is taken towards the reparation of that bridge. *Antiq. of Exeter.*

WOOD-MOTE, the antient name of that foreſt-court, now called *the court of attachment.* See ATTACHMENT, and FOREST.

WOOD-PLEA-*Court*, is a court held twice a year in the foreſt of Clun in Shropſhire, for determining all matters relating to *wood*, and the feeding of cattle there.— Perhaps it was originally the ſame with *wood-mote-court.*

WOODWARD[*], an officer of the foreſt, whoſe function is to look after the *woods*, and obſerve any offences either in vert or veniſon, committed within his charge; and to preſent the ſame; and in caſe any deer are found killed, or hurt, to inform the verdurer thereof, and preſent them at the next court of the foreſt. See FOREST.

WOOF, among manufacturers, the threads which the weavers ſhoot a-croſs, with an inſtrument called a *ſhuttle*, between the threads of the warp, to form the web. See WARP, WEB, WEAVING, &c.

The *woof* is of different matter, according to the piece to be wrought.— In taffety, both *woof* and warp are ſilk. See TAFFETY.

In mohairs, the *woof* is uſually wool, and the warp ſilk.— In ſattins, the warp is frequently flax, and the *woof* ſilk. See CLOTH, SERGE, SATTIN, VELVET, &c.

WOOL, *lana*, the hair, or covering of ſheep; which, waſhed, ſhorn, dreſſed, combed, ſpun, wove, *&c.* makes divers kinds of ſtuffs, cloths, *&c.* for apparel, furniture, *&c.* See HAIR, and MANUFACTURE.

While the *wool* remains in the ſtate it was firſt ſhorn off the ſheep's back, and not ſorted into its different kinds, it is called *fleece*. See FLEECE.

Each fleece conſiſts of *wool* of divers qualities, and degrees of fineneſs, which the dealers therein take care to ſeparate.

The French and Engliſh uſually ſeparate each fleece into three ſorts; *viz.* 1°. *Mother-wool*, which is that of the back and neck. 2°. The *wool* of the tails and legs. 3°. That of the breaſt, and under the belly.

The Spaniards make the like diviſion into three ſorts, which they call *prime*, *ſecond*, and *third*; and, for the greater eaſe, denote each bale or pack with a capital letter, denoting the ſort.— If the triage or ſeparation be well made, in fifteen bales there will be twelve marked R; that is, refine, or prime; two marked F, for fine, or ſecond; and one S, for thirds.

The *wools* moſt eſteemed are the Engliſh, chiefly thoſe about Leominſter, Cotſwold, and the Iſle of White; the Spaniſh, principally thoſe about Segovia; and the French, about Berry: which laſt are ſaid to have this peculiar property, that they will knot or bind with any other ſort; whereas the reſt will only knot with their own kind.

Among the antients, the *wools* of Attica, Megara, Laodicea, Apulia, and eſpecially thoſe of Tarentum, Parma, and Altino, were the moſt valued.— Columella ſets the two laſt even about that at Tarentum, Lib. VIII. c. 2.— And Varro aſſures us, the people there uſed to clothe their ſheep with ſkins, to ſecure the *wool* from being damaged. *De Re Ruſt.* Lib. II. c. 2.

Tavernier affirms, that the *wools* in Aſia are incomparably finer than thoſe of Europe; and that there is no doubt, but that *wool* was the golden fleece ſought for at Colchis. See GOLDEN *Fleece*.

The art of preparing and working *wool*, is attributed, by the antients, to Minerva; who, accordingly, is made the genius and protectreſs thereof. See WOOLLEN.

Engliſh WOOL.— The *wools* of England have always been in the higheſt repute; and that more abroad than at home.— Some we have, which, manufactured by our own clothiers, Chamberlayne obſerves, does, both for ſoftneſs and fineneſs, vie with the choiceſt ſilks.— *Spaniſh wools*, we know, bear a great price among us; but it is certain, much the greateſt part of that, which, when manufactured, our clothiers, *&c.* call *Spaniſh cloth*, grows in England.— Add, that the French can make no good cloth of their own *wool*, without, at leaſt, one third of Engliſh *wool* mixed with it.— It is allowed, the goodneſs of the Spaniſh *wool* is owing to a few Engliſh ſheep ſent over into Spain, as a preſent, by Henry II. of England; or, as others will have it, though we think miſtakenly, by Edward IV. in 1465.

The fineneſs and plenty of our *wools* is owing, in ſome meaſure, to the ſweet, ſhort graſs in many of our paſtures and downs; though the advantage of our ſheep feeding on this graſs all the year, without being obliged to be ſhut up in folds during the winter, or to ſecure them from wolves at other times, contributes not a little thereto.

The Scotch and Iriſh *wools*, are commonly ſold abroad for Engliſh; and upon the ſame footing.— But foreigners, ſkilled in thoſe matters, find they come far ſhort of it in fineneſs; though, in ſome markets, the Iriſh is even ſaid to be preferred to the Engliſh.

The yearly produce of *wool* in England is calculated by Dr. Davenant, and Mr. King, at two millions ſterling. See WOOLLEN *Manufactory*.

Antiently, the principal commerce of the nation conſiſted in *wool* unmanufactured; which foreigners, eſpecially the French, Dutch, and Flemiſh bought of us. Inſomuch, that the cuſtoms of Engliſh *wool* exported in Edward the third's reign, amounted, at 50 *s.* a pack, to 250000 *l.* per annum. An immenſe ſum in thoſe days! See COMMERCE.

This exceſſive cuſtom on the export of unmanufactured *wool*, ſet our people to the making it into cloth themſelves.— In which they ſucceeded ſo well, that towards the cloſe of the ſixteenth century, under the reign of queen Elizabeth, the exportation of any *wool* at all was abſolutely prohibited; and this, upon pain of having the right hand ſtruck off. See CONTRABAND.

From that time, England has been exceedingly jealous of its *wool*.— To prompt their vigilance, the judges, king's council at law, and maſters in chancery, in parliament, are ſeated on *wool* packs.— Accordingly, ſcarce a parliament but has renewed, and reinforced the prohibition; particularly, about the middle of the ſeventeenth century, the exporting of *wool* was made a capital crime.

But all theſe precautions are ineffectual; the Engliſh themſelves, particularly about the coaſts of Suſſex, making uſe of the long winter nights to waft over their *wools* to France: being ſure of carrying them to a good market, they deſpiſe the penalty, with an intrepidity, that the reſt of Europe are amazed at it. See OWLERS.

M. Colbert, a name the French manufactures and commerce are infinitely indebted to, had entertained a deſign of procuring ſome of our Engliſh ſheep, and propagating them in France; hoping, that by chuſing them, in the provinces of that kingdom, ſuch paſtures, and ſuch a ſky as they had in their own iſland, they might there be perpetuated; and France be no longer obliged precariouſly to depend on the clandeſtine ſupplies of *wool* from the Engliſh owlers.— But the count de Cominges, then ambaſſador of France at the Engliſh court, laid the impoſſibility of having ſuch an export of ſheep, and the almoſt equal impoſſibility of keeping and making them multiply there, ſo ſtrongly before him, that he abandoned the deſign.

Wool is reckon'd by the *ſack*, containing two weighs; the *weigh*, ſix tod and a half; the *tod*, two ſtones; the *ſtone*, two cloves; and the *clove*, ſeven pounds.— Twelve ſacks make a *laſt*, or 4368 pounds. See LAST, SACK, &c.

A *ſack* of *wool*, or 364 pounds, is ſufficient for four ſtandard cloths, to render them true breadth, *i. e.* ſix quarters and a half; true weight, *i. e.* ſixty pound; and the true length, *i. e.* twenty-four yards.

From the divers preparations of *wool*, ſee CARDING, COMBING, SPINNING, WEAVING, FULLING, CLOTH, &c.

Pocket of WOOL.	See the article	POCKET.
Sarplar of WOOL.		SARPLAR.

WOOL-DRIVERS, are thoſe who buy *wool* of the ſheep-owners in the country, and carry it on horſeback to the clothiers, or market-towns, to ſell it again.

WOOLLEN *Manufactory*, includes the ſeveral ſorts of commodities into which *wool* is wrought; as *broad cloths*, *long* and *ſhort kerſeys*, *bays*, *ſerges*, *flannel*, *perpetuanas*, *ſays*, *ſtuffs*, *frize*, *penniſtons*, *ſtockings*, *caps*, *rugs*, &c.— Each whereof, ſee under its reſpective article Cloth, Serge, Flannel, &c.

---

[*] *Woodward* may not walk with bows, and ſhafts, but with foreſt-bills.— *Arcum & calamos geſtare in foreſta non licet, ſed (ut reſcripti utar verbo) hachetum tantummodo.* Term. Hill. An. 13 Ed. III.

The *woollen manufactory*, which now makes the principal article both in our foreign and domeſtic trade, being that which furniſhes the cargoes of our veſſels, that employs our people, *&c.* may be ſaid to have had its riſe in the fifteenth century.

Till that time, our *wool* was all ſold in the fleece, to ſuch of our neighbours as came to fetch it.— Among our cuſtomers, however, the principal were the Flemings, and Brabanters; and particularly the merchants of Gant and Louvain, who took off vaſt quantities to ſupply two manufactories that had flouriſhed in thoſe two cities from the tenth century; and had furniſhed the greateſt part of Europe, and even England itſelf, with all ſorts of *woollen* cloths, *&c.*— But the richneſs of the manufactories of Gant, and the incredible number of hands employed therein, having ſpirited up the inhabitants to revolt, divers times, againſt their ſovereigns, on account of certain taxes which they refuſed to pay; the ſeditious were at length puniſhed, and diſperſed, and part of them took refuge in Holland, and the reſt in Louvain.

Theſe laſt, together with their art of manufacturing cloths, carried with them their ſpirit of ſedition.— And it was not long ere ſeveral of them, to avoid the puniſhment they had deſerved for killing ſome of the magiſtrates, removed into England; where they inſtructed our people how to work their own *wools*.

This eſtabliſhment is referred to the year 1420; from which time no endeavours have been ſpared to keep our *wools* to ourſelves. See Wool.

The preſident Thuanus makes this epocha an hundred years later; and attributes the eſtabliſhment of the *woollen manufactures* in England to queen Elizabeth, and the troubles about religion, which the ſeverity of the duke of Alva and the Spaniſh Inquiſition had occaſioned, and kept up ſo long in the Low Countries.— But what that noble author ſays, is rather to be underſtood of their perfection, than their firſt eſtabliſhment; and of the ſeveral great manufactures then ſet up at Norwich, Colcheſter, Sandwich, Hampton, *&c.* — For in the Engliſh and Flemiſh hiſtorians, we find mention made of the manufactures of London, long before any part of the ſeventeen provinces had attempted to throw off the Spaniſh yoak.

As this manufacture now ſtands, Dr. Davenant and Mr. King compute the produce thereof to be eight millions per annum; three fourths whereof are conſumed at home, and the reſt exported. See Revenue, Political *Arithmetic*, &c.

So jealous are we now become of our *woollens*, that, beſides the precautions taken to uſe all our own *wools* ourſelves, we have added that of ſelling them ourſelves, and of carrying them to the places were they are required; not admitting ſtrangers to come and buy any in England. See Navigation.

And hence the eſtabliſhment of thoſe famous magazines in Holland, the Levant, and the North, where our *woollens* are repoſited, to be vended by factors, or commiſſioners.— The magazine in Holland has changed place divers times; and it has been ſucceſſively at Middleburgh, Delf, Rotterdam, and Dort, where it now remains; and where all the Germans come to furniſh themſelves.— That for the Levant, is at Smyrna; and that for the North, at Archangel.

A pack, or 240 pounds weight of ſhort *wool*, it is computed, employs ſixty-three perſons a week, to manufacture it into cloth; *viz.* three men to ſort, dry, mix, and make it ready for the ſtock-carder; five to ſcribble, or ſtock-card it; thirty-five women and girls, to card and ſpin it; eight men to weave it; four men and boys to ſpoole it, and reed quills; eight men and boys to ſcour, burl, mill, or full it; row, ſhear, pack, and preſs it.

A pack of large, long, combing *wool*, made into ſtuffs, ſerges, ſagathies, *&c.* for the Spaniſh trade, will employ, for one week, 202 perſons, whoſe wages amount to 43 *l.* 10 *s.* — Thus, 7 combers, 3 *l.* 10 *s.* dyers, 5 *l.* 150 ſpinners, 18 *l.* 20 throwers, and doublers, 5 *l.* 25 weavers, and attendants, 12 *l.*

A pack of *wool* made into ſtockings, will employ, for one week, 184 perſons, who will earn 56 *l.*— Thus, 10 combers, 5 *l.* 5 *s.* the dyer, 1 *l.* 6 *s.* 102 ſpinners, 15 *l.* 12 *s.* doublers and throwers, 4 *l.* 10 *s.* 60 ſtocking-weavers, 30 *l.*

Bleaching of Woollens. See the article Bleaching.

WOOL-STAPLE, denotes a city or town where *wool* uſed to be ſold. See Staple.

WOOLSTED. See the article Worsted.

WOOL-WINDERS, are perſons employed in winding up fleeces of *wool* into bundles, to be packed, and ſold by weight.— Theſe are ſworn to do it truly between the owner and the merchant.

WORD, in language, is an articulate ſound, deſigned to repreſent ſome idea. See Sound, Voice, Sign, Idea, &c.

Word, in writing, is an aſſemblage of ſeveral letters, forming one or more ſyllables, and ſignifying ſome thing. See Letter, and Syllable.

The Port-Royaliſts define *words* to be diſtinct articulate ſounds, agreed on by mankind, to convey their thoughts and ſentiments by. See Language.

Grammarians divide *words* into eight claſſes, called *parts of ſpeech*; which are the *noun*, *pronoun*, *verb*, *participle*, *adverb*, *conjunction*, *prepoſition*, and *interjection*; to one or other of which, all the *words* and terms in all languages, which have, or may be invented to expreſs our ideas, are reducible. See each under its proper article, Noun, Pronoun, Verb, &c.

Words, again, are divided into *primatives* and *derivatives*, *ſimple* and *compound*, *ſynonymous* and *equivocal*. See Primitive, Derivative, Root, &c.

With regard to their ſyllables, *words* are further divided into *monoſyllables*, and *polyſyllables*. See Monosyllable, and Polysyllable.

The grammatical figures of *words*, which occaſion changes in the form, *&c.* thereof, are *ſyncope*, *apocope*, *apoſtrophe*, *diæreſis*, *aphæreſis*, *proſtheſis*, *epentheſis*, *paragoge*, *metatheſis*, &c. See each in its proper place, Syncope, Apocope, &c. ſee alſo Figure, &c.

The uſe of *words*, we have obſerved, is to ſerve as ſenſible ſigns of our ideas; and the ideas they ſtand for in the mind of the perſon that ſpeaks, are their proper ſignifications. See Sign, Semeiotica, Science, &c.

Simple and *primitive words* have no natural connection with the things they ſignify; whence there is no rationale to be given of them: it is by a mere arbitrary inſtitution and agreement of men, that they come to ſignify any thing.— Certain *words* have no natural propriety or aptitude, to expreſs certain thoughts, more than others; were that the caſe, there could have been but one language. See Primitive.

But, in derivative and compound words, the caſe is ſomewhat different.— In the forming of theſe, we ſee, a regard is had to agreement, relation, and analogy: thus, moſt *words* that have the ſame ending, have one common and general way of denoting or ſignifying things; and thoſe compounded with the ſame prepoſitions, have a ſimilar manner of expreſſing and ſignifying ſimilar ideas in all the learned languages where they occur.

For the perfection of language, it is not enough, Mr. Locke obſerves, that ſounds can be made ſigns of ideas; unleſs theſe can be made uſe of, ſo as to comprehend ſeveral particular things; for the multiplication of *words* would have perplexed their uſe, had every particular thing needed a diſtinct name to be ſignified by.

To remedy this inconvenience, language had a farther improvement in the uſe of general terms, whereby one *word* was made to mark a multitude of particular exiſtences; which advantageous uſe of ſounds was obtained only by the difference of the ideas they were made ſigns of; thoſe names becoming general, which are made to ſtand for general ideas; and thoſe remaining particular, where the ideas they are uſed for are particular. See General, Abstract, &c.

It is obſervable, that the *words* which ſtand for actions, and notions quite removed from ſenſe, are borrowed from ſenſible ideas; as, to imagine, apprehend, comprehend, underſtand, adhere, conceive, inſtil, diſguſt, diſturbance, tranquillity, *&c.* which are all taken from the operations of things ſenſible, and applied to modes of thinking.— *Spirit*, in its primary ſignification, is no more than breath; *angel*, a meſſenger. By which we may gueſs what kind of notions they were, and whence derived, which filled the minds of the firſt beginners of languages; and how nature, even in the naming of things, unawares, ſuggeſted to men the originals of all their knowledge: whilſt, to give names that might make known to others any operations they felt in themſelves, or any other ideas that came not under their ſenſes, they were forced to borrow *words* from the ordinary and known ideas of ſenſation. See Sensation, Perception, &c.

The ends of language in our diſcourſe with others, are chiefly three: firſt, to make our thoughts or ideas known one to another.— This we fail in, 1°. When we uſe names without clear and diſtinct ideas in our mind. 2°. When we apply received names and ideas, to which the common uſe of that language doth not apply them. 3°. When we apply them unſteadily, making them ſtand now for one, and anon for another idea.

Secondly, to make known our thoughts with as much eaſe and quickneſs as poſſible.— This men fail in, when they have complex ideas, without having diſtinct names for them; which may happen either through the defect of a language, which has none; or the fault of the man, who has not yet learned them.

Thirdly, to convey the knowledge of things.— This cannot be done, but when our ideas agree to the reality of things.— He that has names without ideas, wants meaning in his *words*, and ſpeaks only empty ſounds.— He that has complex ideas without names for them, wants diſpatch in his expreſſion.— He that uſes his *words* looſely and unſteadily, will either not be minded, or not underſtood.— He that applies names to his ideas, different from the common uſe, wants propriety in his language, and ſpeaks gibberiſh; and he that has ideas of ſubſtances, diſagreeing with the real exiſtence of things, ſo far wants the materials of true knowledge. See KNOWLEDGE.

Diviſion of WORDS.	See the article	DIVISION.
General WORDS.		GENERAL.

WORD, *Watch*-WORD, in an army, or garriſon, is ſome peculiar *word*, or ſentence, by which the ſoldiers know, and diſtinguiſh one another in the night, *&c.* and by which ſpies, and deſigning perſons are diſcovered.

It is uſed alſo to prevent ſurprizes.— The *word* is given out in an army every night by the general, to the lieutenant, or major-general of the day, who gives it to the majors of the brigades, and they to the adjutants; who give it firſt to the field-officers, and afterwards to a ſerjeant of each company, who carry it to the ſubalterns.

In garriſons it is given, after the gate is ſhut, to the town-major, who gives it to the adjutants, and they to the ſerjeants. See ROUNDS.

WORD, in heraldry, *&c.* See the article MOTTO.

WORK-HOUSE, a place where indigent, vagrant, and idle people are ſet to *work*, and maintained with cloathing, diet, *&c.*

Such is Bridewell, and ſeveral other places about the city, or ſuburbs; particularly that in Biſhopſgate-ſtreet, for employing the poor children of the city and liberties, who have no ſettlement; and that for the pariſh of S. Margaret's Weſtminſter, called the *grey-coat hoſpital.* See HOSPITAL.

At Amſterdam they have a famous *work-houſe*, or houſe of correction, called the *Raſphuyſe*, which, by a privilege granted in 1602, has alone the right of ſhaving, and cutting the dyers woods, as brazil, ſantal, campeche, ſaſſafras, *&c.*

Each perſon, tolerably ſtrong, kept in the houſe, is obliged to furniſh 250 pounds of raſped wood per day; and the weaker, a certain quantity of chips.

WORKS, *Opera*, in fortification, the ſeveral lines, trenches, ditches, *&c.* made round a place, an army, or the like, to fortify, and defend it.— See *Tab. Archit. fig.* 21. ſee alſo the articles LINE, TRENCH, &c.

The principal *works*, in a fortreſs, or fortified place, ſee under the articles FORTIFIED *Place*, FORTIFICATION, &c.

WORLD, *Mundus*, the aſſemblage of parts which compoſe the univerſe. See UNIVERSE.

The *duration of the world*, is a thing which has been greatly diſputed.— Plato, after Ocellus Lucanus, held it to be eternal; and to have flowed from God, as rays flow from the ſun. Ariſtotle was much of the ſame mind: he aſſerts, that the *world* was not generated, ſo as to begin to be a *world*, which before was none: and, in effect, his whole eighth book of *Phyſ.* and firſt book *de Cœlo*, is ſpent in proving the eternity of the *world.* See ETERNITY.

He lays down a pre-exiſting and eternal matter, as a principle; and thence argues the *world* eternal.— His argument amounts to this, that it is impoſſible an eternal agent, having an eternal paſſive ſubject, ſhould continue long without action. See ARISTOTELIAN, MATTER, *&c.*

His opinion was generally followed; as ſeeming to be the fitteſt to end the diſpute among ſo many ſects about the firſt cauſe. See CAUSE.

Epicurus, however, though he makes matter eternal, yet ſhews the *world* to be but a new thing, formed out of a fortuitous concourſe of atoms. See *Lucretius*, Lib. V. See MATTER, ATOM, &c. ſee alſo EPICUREAN, &c.

Some of the modern philoſophers refute the imaginary eternity of the *world*, by this argument: that, if it be ab æterno, there muſt have been a generation of individuals, in a continual ſucceſſion from all eternity; ſince no cauſe can be aſſigned why they ſhould not be generated, *viz.* one from another.— Therefore, to conſider the origin of things, and the ſeries of cauſes, we muſt go back in infinitum, *i. e.* there muſt have been an infinite number of men, and other individuals already generated; which ſubverts the very notion of number.— And if the cauſe which now generates hath been produced by an infinite ſeries of cauſes; how ſhall an infinite ſeries be finite, to give room for new generations?

Dr. Halley ſuggeſts a new method of finding the age of the *world*, from the degree of ſaltneſs of the ocean. See SALTNESS, &c.

It is another popular topic of controverſy, whether the *world* be finite, or infinite? See the arguments on both ſides, under the article UNIVERSE.

It is likewiſe diſputed, whether the plurality of *worlds* be poſſible? See PLURALITY.

Some hold the affirmative, from an opinion of the infinite power of the Deity; it being a ſetting bounds to omnipotency, to ſay, that he created ſo many bodies at firſt, and that he could not create more.

The Carteſians maintain the negative, upon theſe principles: that it is a contradiction to ſay, there are ſeveral *worlds* exiſting at the ſame time, ſince this implies ſeveral univerſes of created beings, the *world* being the το παν. That if there were ſeveral *worlds*, they muſt either be at a diſtance from one another, or contiguous; but neither can be ſaid: for were they contiguous, they would only conſtitute one; and were they diſtant, there muſt be ſomething between. But what can be between? If it be extended, it is corporeal; and inſtead of ſeparating the ſeveral *worlds*, will connect them into one.

The *Exiſtence of an eternal World* has been much controverted of late. The arguments on either ſide, ſee under the articles BODY, EXISTENCE and EXTERNAL.

The *world* is ſometimes divided into *upper*, and *lower.*

Lower, or *ſublunary* WORLD, is the globe of our earth. See EARTH.

Upper WORLD, includes the heavens, and heavenly bodies. See HEAVEN, COELESTIAL, &c.

Axis of the WORLD.	See the article	AXIS.
Map of the WORLD.		MAP.
Soul of the WORLD.		ANIMA *Mundi.*
Syſtem of the WORLD.		SYSTEM.

WORMS, *Lumbrici*, or *Vermes*, in medicine, a diſeaſe ariſing from ſome of thoſe reptiles being generated, and growing in the body: whence, frequently, dire ſymptoms do proceed.

The ordinary place of the *worms*, is the inteſtines: though there is ſcarce any part of the body but is ſometimes infected with them: for beſides the *vermes inteſtinales*, there are *dentales*, *gingivales*, *pulmonarii*, *cardiaci*, *ſanguinarii*, *cutaneous*, *umbilical*, *hepatic*, *ſalival*, &c.

They are all uſually ſuppoſed to be ingendered from the eggs of ſome inſect, depoſited in ſomething that is taken into the body by way of food; or ſome other way: an hypotheſis, however, which will hardly account for certain ſpecies of theſe inſects, not to be found but in the bodies of animals.— A ſolution of this difficulty will, perhaps, be hard to find, without having recourſe to the firſt ſtamina of animals, and the principles of generation. See ANIMAL, GENERATION, INSECT, &c.

There are three ſpecies of *worms*, moſt frequent in the human body: the *teretes*, or round and thick, moſtly found in the duodenum; the *latus*, or flat, called alſo *tænia*; and the round and ſmall, found in the rectum, called *aſcarides.* See ASCARIDES, &c.— Sometimes, indeed, there are anomalous *worms* expelled; as horned, hairy, four-footed, two-headed, *&c. worms.*

The ſymptoms of this diſeaſe are, vomiting, head-ach, heart-burn, ſighing, ſwooning, feeble pulſe, heavy ſleep, deliria, ſquinancy, pleuriſy, canine hunger, and innumerable others; occaſioned by the animals ſucking, moving, vellicating, gnawing, conſuming the chyle, irritating the nerves, wounding the ſolids, *&c.*

As to the latus, beſide the other common ſymptoms, thoſe affected with this, have one peculiar to them; which is, that with their ſtools they diſcharge ſeveral little bodies, like gourd-ſeeds.

Dr. Tyſon, in the *Philoſophical Tranſactions*, N° 146. gives a curious account of the *flat worm*, or *lumbricus latus*; called by Hippocrates, ταινια, and in Engliſh, ordinarily, the *tape-worm*, or *joint-worm.*— This is always ſingle: it lies variouſly convoluted; being ſometimes as long as all the guts; and ſometimes vaſtly exceeds that length.

Olaus Borrichius aſſures us, a patient of his, in a year's time, voided 800 foot of this *worm*, though he had not yet met with the head: in voiding, the patient always obſerved it to break off.

Dr. Tyſon parallels this caſe with that of a patient of his, who voided vaſt quantities of this *worm*, for ſeveral years together; but in various pieces: ſome two, three, four, ſix, or more yards long: but all put together, he ſays, would much exceed the length of that of Borrichius.

The joints in this *worm* are very numerous: in one of 24 feet long, Dr. Tyſon numbered 507 joints.— Above the middle of the edges of each joint, he obſerved a protuberant orifice.— Thoſe orifices he takes for ſo many *mouths*; the beſt microſcopes diſcovering no mouth in what uſually paſſes for the head.

The *worm* is frequent enough in moſt kinds of animals; as dogs, oxen, crabs, herrings, pikes, *&c.*— Some authors aſſert, that it is not one, but many *worms* linked together, and included in a ſpolium of the inteſtines; and that this ſpolium is not animated, but receives its ſenſe and motion from a ſort of vermiculi cucurbitini incloſed in it.— This, Gabucinus, *de Lumb. Com.* ſays, he has plainly diſcovered: but Dr. Tyſon abundantly evinces the contrary.

In Perſia, *&c.* there are very long ſlender *worms*, ſix or ſeven yards long, bred in the legs, and other parts of men's bodies: when arrived at a certain pitch, they put out their heads, necks, *&c.* and withdraw them (if diſpleaſed or hurt) again, cauſing intolerable pains, fevers, *&c.* See CRINONES, and DRACUNCULI.

Ariſtotle obſerves, that all deer have *worms* under their tongues. — Sheeps noſes often abound with them.

In the *Philoſoph. Tranſact.* N° 113. we have accounts of divers remarkable operations whereby *worms* were taken out of divers unſuſpected parts of the body; the operators being chiefly women.— Mrs. Mary Haſtings is there recorded, as famous for the diſcovering of *worms* hid in the face, gums, tongue, *&c.* which ſhe managed with ſuch addreſs, that ſhe took them out of any part affected, with a gooſe-quill.— Mr. Dent relates, that he himſelf was cured of certain odd tumors on his tongue, by one of thoſe worm-doctreſſes, Mrs. French; who, piercing the parts affected with a lancet, drew out five or ſix *worms* at a time.— In leſs than eight days, he aſſures us, ſhe took out of his tongue above a hundred *worms*, and thirty out of his gums. See HYDATIDES.

Sir Theodore Mayerne aſſures us, in the *Philoſoph. Tranſact.* N° 211. that the famous ſugar, or remedy given by Pontæus, (a celebrated chymical empiric) for the *worms* in children, is fifteen grains of mercurius dulcis, with five grains of ſcammony, or two or three times as much ſugar, made up in lozenges.— He adds, that this doſe, which in France purges grown perſons, is ineffectual in England, to perſons of above fifteen years old, and ought to be augmented. See WORMSEED.

Cochineal WORM. See the article COCHINEAL.
Silk WORM. See the article SILK.
Solitary WORM. See the article SOLITARY.
Spermatic WORM. See the article SPERMATIC.

WORM, in chymiſtry, denotes a long, winding pewter-pipe, which diſtillers and apothecaries place in a tub of water, to cool and condenſe the vapours in the diſtillation of ſpirits. See ALEMBIC, DISTILLATION, &c.

This the chymiſts alſo call a *ſerpentine*. See SERPENTINE. — Formerly, this *worm*, or ſomething like it, was placed above the head of the ſtill, with a refrigeratory at the upper end of it, which is uſeful enough in the diſtilling of ſpirit of wine. See REFRIGERATORY.

To **WORM** *a cable*, or *hawſer*, in the ſea-phraſe, ſignifies to ſtrengthen it, by winding a ſmall line, or rope, all along between the ſtrands. See CABLE, &c.

To **WORM** *a dog*, is to take out a kind of *worm* from under his tongue; which, if let alone, would make him mad.

WORM-SEED, *Semen contra*, *ſemen ſanctum*, or *ſemen ſantonicum*, is a hot, bitter, drying kind of ſeed, proper to deſtroy *worms* generated in a human body, particularly in children. See WORMS.

This ſeed is ſmall, of a browniſh colour, an oblong figure, a bitter taſte, and a ſtrong ſmell.— It muſt be choſen new, greeniſh, of a ſharp, bitter, aromatic taſte, not a little diſagreeable.

The place where it is produced, is Perſia, about the frontiers of Muſcovy. It is brought to us from Aleppo, *&c.*— Naturaliſts are not agreed about the plant that produces it. J. Bauhine has a large diſſertation on the ſubject.— Some will have it the ſpecies of abſynthium, or wormwood, called *ſantonicum*, or *marinum abſynthium*; others will have it the *tanacetum*, others the *abrotanum*.

M. Tournefort gives us the following account of this notable drug, in the ſecond volume of his travels. The ſementine, or *worm-powder*, is not gathered like our ſeeds.— The plant grows in the meadows, and muſt be let ripen; and the miſchief is, that as it grows near to maturity, the wind ſcatters a good part of it among the graſs, where it is loſt; and this it is makes it ſo dear.

As they dare not touch it with the hand, for fear of making it ſpoil the ſooner; when they would gather what is left in the ear, they have recourſe to this expedient.— They take two hand-baſkets, and, walking along the meadows, ſweep the baſkets, the one from right to left, the other from left to right, as if they were mowing; by this means the ſeed is ſhook out into the baſkets.

WORMWOOD, a medicinal herb, among phyſicians, *&c.* called *abſynthium*. See ABSYNTHIUM.

WORMWOOD-*Wine*, *Vinum abſynthites*. See VINUM.

WORSHIP *of God*, *Cultus Dei*, amounts to the ſame with what we otherwiſe call *religion*. See RELIGION.

This *worſhip* conſiſts in paying a due reſpect, veneration, and homage to the Deity, under a certain expectation of reward. See GOD.

And this internal reſpect, *&c.* to be ſhewn, and is teſtified by external acts; as prayers, ſacrifices, thankſgivings, *&c.* See PRAYER, SACRIFICE, &c.

The Quietiſts, and ſome other myſtic divines, ſet aſide not only all uſe of external *worſhip*; but the conſideration of rewards and puniſhments. See QUIETISM, DEIST, &c.

Yet, even the heathens had a notion, that God did not require us to ſerve him for nought:— *Dii quamobrem colendi ſunt*, ſays Cicero, *non intelligo, nullo nec accepto ab illis nec ſperato bono.*

The ſchool-divines divide *worſhip* into divers kinds, *viz. latria*, that rendered to God; and *idolatria*, that rendered to idols, or images.— To which the Romaniſts add, *dulia*, that rendered to ſaints; and *hyperdulia*, that to the virgin. See IDOLATRY, IMAGE, LATRIA, HYPERDULIA, &c.

WORSTED, or WOOLSTED, in matters of commerce and manufacture, is a kind of woollen-thread. See WOOL.

Worſted is, properly, a thread ſpun of wool that has been combed; and which, in the ſpinning, is twiſted harder than ordinary. See COMBING.

It is chiefly uſed either to be knit, or wove into ſtockings, caps, gloves, or the like. See STOCKING, &c.

The name *worſted*, is ſuppoſed to be borrowed from a town thus called, in Norfolk, noted for fine ſpinning.— They who write it *woolſted*, do it on ſuppoſition of the word's being formed from *wool*, the matter of this thread.

WOVEN *Stockings*. See the article STOCKING.

WOULD, or WELD, among dyers. See WELD.

WOULDING, a ſea-term, for the winding of ropes faſt round about a yard, or maſt of a ſhip, after it has been ſtrengthened by ſome piece of timber nailed thereto.

WOUND, *Vulnus*, in medicine and chirurgery, a recent ſeparation, made in the ſoft or fleſhy parts of the body, from an external cauſe; and particularly the action of ſome hard and ſharp inſtrument. See SOLUTION.

Or, it is a ſolution of the continuity of a fleſhy part, made by ſome penetrating body; while it yet remains freſh, bloody, and without putrefaction: by which circumſtances a *wound* is diſtinguiſhed from an *ulcer*. See ULCER.

A like ſeparation happening in a bony part, is called a *fracture*. See FRACTURE; ſee alſo FLESH, BONE, &c.

All *wounds* proceed either from puncture, inciſion, or contuſion, according to the nature and make of the inſtrument they were cauſed by. See PUNCTURE, CUTTING, CONTUSION, &c.

Wounds are uſually divided, with reſpect to their cauſe, circumſtances, cure, *&c.* into *ſimple*, and *compound*.— *Simple wounds* are thoſe made by puncture, inciſion, or contuſion ſeparately; thoſe of the outer ſkin, without any conſiderable loſs of ſubſtance, or hurting any remarkable veſſel; and thoſe not complicated with any dangerous ſymptoms.

Compound wounds, are thoſe made both by puncture and inciſion at the ſame time, to which is ſometimes alſo added contuſion; thoſe attended with great loſs of fleſh, or the hurt of ſome conſiderable veſſel; add, thoſe made by envenomed inſtruments, or attended with violent ſymptoms.

The hiſtory of a *wound* is thus delivered by Boerhaave.— Immediately upon the ſolution, the *wounded* parts recede further and further from each other.— The blood guſhes out, at firſt, with ſome violence; but ſtops of itſelf: then a bloody ſcab is formed in the cavity of the *wound*, and a thin ruddy humour oozes out; the lips of the *wound* begin to redden, ake, ſwell, and turn back; and in (great *wounds*) a fever and thirſtineſs ſucceed.— On the third or fourth day, there is found a white, viſcid pus; upon which, the heat, redneſs, tumor, *&c.* abate, and the cavity gradually fills up from the bottom upwards, and from the circumference to the centre with growing fleſh.— Laſtly, the *wound* dries, and cicatriſes.

But note, theſe ſymptoms vary according to the nature and cauſe of the *wound*.— Thus, if it be by inciſion, and a large blood-veſſel be cut, the hæmorrhage is more violent; eſpecially if it be an artery; in which caſe florid blood flies out impetuouſly, and by ſtarts: if only a vein be cut, the flux is more moderate and equable, and the blood of a darker colour. — If the *wound* be attended with contuſion, the hæmorrhage is ſmall.

In *wounds*, where any large artery is quite cut in two, the flux uſually proves mortal.— A leſſer artery, cut tranſverſely, flies back againſt the ſolid parts, and will have its mouth ſtopped: if any artery be not quite cut off, there ariſes a perpetual flux; or, if that be ſtopped, an aneuryſma.— A nerve being cut off, flies back, produces a pain, and obſtruction about the *wound*; and below it, a numbneſs, and waſting immobility: the caſe is much the ſame in wounded tendons, and membranes.— *Wounds* of the temporal muſcle are rarely cured; but generally bring on horrible convulſions.

The following *wounds* are commonly reputed mortal; *viz.* thoſe of the cerebellum, and of the cerebrum, if they be deep enough to hurt the medulla oblongata; deep *wounds* in the ſpinal marrow, eſpecially the upper part thereof; thoſe of the heart, lungs, liver, ſpleen, kidneys, pancreas, meſentery, ſtomach, inteſtines, *&c.* and thoſe of the cava, aorta, carotides,

rotides, pulmonary, and other large veins and arteries; thoſe of the bronchia, thorax, diaphragm; large *wounds* of the oeſophagus, trachea, and the bladder; and all invenomed *wounds*.

In young children, and aged perſons, *wounds* frequently prove mortal, which ſeemed but ſlight.— Thoſe *wounds* generally prove troubleſome which happen in an ill ſtate of body, and eſpecially a low, or ſpare diet.— All *wounds* are reputed more dangerous and difficult of cure in winter, than ſummer; in autumn, than in ſpring.

The cure of *wounds* conſiſts in uniting the divided parts; which is the work of nature alone, and which the chirurgeon can only contribute to by removing external impediments, and applying medicines familiar to the part, called *vulneraries*, and *balſamics*. See VULNERARY, &c.

The firſt ſtep, then, to be taken in a ſimple *wound*, is to cleanſe it, and extract any heterogeneous body that may chance to be lodged therein.— Next, the cavity to be gently wiped with doſſils dipt in warm red wine.— The lips, now, to be brought together by bandages or ſutures; and the *wound* to be covered with a pledget dipt in balſam of Peru, or oil of ſweet almonds.— The pain thus eaſed, and the ſymptoms removed, the *wound* is to be ſuppurated, deterged, incarnated, and cicatrized after the manner of tumors, and ulcers. See SUPPURATION, DETERGENT, INCARNATIVE, CICATRISIVE, &c.

If the *wound* be dangerous, the ſymptoms violent, and the body cacochymic, more powerful means are had recourſe to; as, firſt, phlebotomy, then gentle cathartics, or clyſters; then vulnerary drinks, apozems, and ptiſans; which cardiacs and paregorics interpoſed.— In internal *wounds*, vulneraries and alkalies do well, particularly album græcum, river lobſters, mercurials, *&c.*

Freſh *wounds* are cured, ordinarily, in three or four days, without any other means, than applying a few drops of balſam of Peru.— Sometimes, however, digeſtives are required. Gun-ſhot *wounds* are uſually the worſt of all, by reaſon of the violent contuſion and ſeparation of the parts; which prevent their coming to digeſtion for the ſpace of three or four days.

In the cure of large *wounds*, bandages and ſutures are required, to fit and diſpoſe them for healing. See SUTURE, &c.

WRACK. See the article WRECK.

WREATH, in heraldry, a roll of fine linen, or ſilk, (like that of a Turkiſh turbant) conſiſting of the colours born in the eſcutcheon; placed, in an atchievement, between the helmet and the creſt, and immediately ſupporting the creſt. See CREST, &c.

WRECK, WRACK, or *Sea*-WRECK, in natural hiſtory, a kind of herb growing in the ſea, upon rocks, and which the waves tearing off, caſt upon ſhore.

In ſome places it is uſed to manure the ground.— In Normandy, and other parts, they burn it; and of the aſhes make a kind of ſoda, which they uſe in the making of common green glaſs, to promote the fuſion or vitrification of the other materials. See GLASS.

WRECK, WRECCUM, called alſo *Ship*-WRECK, or *Ship*-WRACK, in law, *&c.* is when a ſhip periſhes in the ſea, and no man eſcapes alive out of it.

The civilians term it *naufragium*.— The goods in the ſhip, which are brought to land by the waves, belong to the king, or him to whom he aſſigns the right thereof*.

* Thus, in the *Stat. Prærog. Reg.* c. 11.— *Rex habebit* wreckum maris *per totum regnum, balænas & ſturgiones captas in mari, vel alibi intra regnum, exceptis quibuſlibet privilegiatis locis, &c.*

If a man, a dog, or even a cat eſcape alive, the party to whom the goods belong coming within a year and a day, and proving the goods to be his, ſhall have them again.

In divers charters, and old writings, it appears, that *wreck*, antiently, not only comprehended goods which came from a periſhing ſhip, but whatever elſe the ſea caſt upon land; whether it were precious ſtones, fiſhes*, ſea-weed, or the like.

* This *wreck*, in the *Grand Cuſtomary of Normanby*, c. 17. is called *varech*, and latined *veriſcum*; and in ſome of our antient charters, *wreche*, *werec*, *werech*, and *ſeupwerp*; q. d. *ſea-upwerp*, of *ſea*, and *up-werpen*, to caſt up.

WRESTLING, a kind of combat, or engagement between two perſons, unarmed, body to body, to prove their ſtrength and dexterity; and try which can throw his opponent to the ground. See EXERCISE, GAME, &c.

Wreſtling, *palæſtra*, is an exerciſe of very great antiquity and fame.— It was in uſe in the heroic age; witneſs Hercules, who *wreſtled* with Antæus. See PALÆSTRA, and GYMNASTICS.

It continued a long time in the higheſt repute; and had very conſiderable rewards and honours aſſigned it at the Olympic games.— It was the cuſtom for the athletæ to anoint their bodies with oil, to give the leſs hold to their antagoniſt. See ATHLETA, &c.

Ablancourt obſerves, that Lycurgus ordained the Spartan maids to *wreſtle* in public, quite naked, to break them of their too much delicacy and niceneſs; to make them appear more robuſt, and to familiarize the people, *&c.* to ſuch nudities. See GYMNASIUM, GYMNASTIC, &c.

WRIST. See the article CARPUS.

WRIT*, *Breve*, in law, a precept of the king in writing, under ſeal, whereby any thing is commanded to be done, touching a ſuit, action, or proceſs for juſtice.— As, the ſummoning a defendant, taking a diſtreſs, redreſſing a diſſeiſin, or the like. See BREVE, PRECEPT, &c.

* The word is formed from the Saxon, ƿꞃıꞇan, to write.

Writs are variouſly divided, and in various reſpects.— Some, with regard to their order, or manner of granting, are termed *original*, and others *judicial*.

Original WRITS, are thoſe ſent out of the high court of chancery, to ſummon the defendant in a perſonal, or tenant in a real action; either before the ſuit begins, or to begin the ſuit thereby. See PROCESS, &c.

Judicial WRITS are thoſe ſent by order of the court where the cauſe depends, upon emergent occaſions, after the ſuit begins.

Judicial Writs are diſtinguiſhed from original, in that their teſte bears the name of the chief juſtice of that court whence they come; whereas the original ſay, *teſte me-ipſo*, in the name, or relating to the king.

Writs are alſo diſtinguiſhed, according to the nature of the action, into *real* and *perſonal*.— *Real*, are either touching the poſſeſſion, called *writs of entry*; or the property, called *writs of right*. See ENTRY, and RIGHT.

Perſonal writs, are thoſe relating to goods, chattels, or perſonal injuries. See PERSONAL.

To which may be added, *mixt writs*, for the recovery both of the thing and damages.

Some *writs*, again, are at the ſuit of the party; ſome, of office; ſome, ordinary; ſome, of privilege.— A *writ of privilege*, is that which a privileged perſon brings to the court for his exemption, by reaſon of ſome privilege which he enjoys.

WRIT *of Neifty*. See the article NEIF.

WRIT *of Rebellion*. See the article COMMISSION *of Rebellion*.

WRITS *Vicountiel*, are ſuch as are triable in the ſheriff's, or county court. See VICOUNTIEL.

WRIT *of Aſſiſtance*, that iſſuing out of the exchequer, to authorize ſome perſon to take a conſtable, or other public officer, to ſeize goods or merchandize prohibited, and uncuſtomed, *&c. Stat.* 14. 2 *Car.* II. c. 1.

There is alſo a *writ* of this name iſſuing out of chancery, to give poſſeſſion of lands.

Action of a WRIT.	See	ACTION.
Appeal by WRIT.		APPEAL.
Attachment by WRIT.		ATTACHMENT.
Continuance of a WRIT.		CONTINUANCE.

WRITER *of the Tallies*, an officer of the exchequer, being clerk to the auditor of the receipt; who writes upon the tallies the whole letters of the tellers bills. See TALLY, EXCHEQUER, &c.

WRITING, *Scriptura*, the art or act of ſignifying and conveying our ideas to others, by letters, or characters viſible to the eye. See CHARACTER, LETTER, WORD, &c.

Writing is now chiefly practiſed among us by means of pen, ink, and paper. See PAPER, INK, &c.— The antients had other methods. See BOOK, BARK, STYLE, &c.

The invention of the art of *writing* is referred to Cadmus. See LETTER, and GREEK.

In law, we ſay, deeds, conveyances, *&c.* are to be in *writing*.— A will may either be in *writing*, or by word of mouth. See DEED, CONVEYANCE, WILL, &c.

We alſo ſay, *written law*, *lex ſcripta*. in oppoſition to common law, which is called *lex non ſcripta*. See LAW, STATUTE, COMMON *Law*, &c.— We have alſo *written* and *unwritten* traditions, *&c.* See TRADITION, ORAL, &c.

Authentic *writings* of any contract, ſealed, and delivered, make the evidences thereof. See AUTHENTIC, EVIDENCE, MUNIMENT, SEAL, SIGNATURE, TESTIMONY, &c.

J. Ravenau has a treatiſe entitled *Des Inſcriptions en Faux*, wherein he ſhews how to revive, and reſtore old *writings* almoſt effaced, by means of galls ground in white wine, and diſtilled; and thus rubbed over the *writing*.

La Vayer has a curious diſſertation on the proof of facts by compariſon of hand-*writings*, wherein he endeavours to ſhew this method of proof to be very ſuſpicious and fallacious. See PROOF, &c.

It is a point controverted among the ſchool-philoſophers, what it is that *writing* properly ſignifies, or repreſents? whether ideas, or things, or words? *i. e.* whether it expreſſes things themſelves, or our ideas of things, or the articulate ſounds by which, on other occaſions, we expreſs thoſe ideas? See WORD, SIGN, SCIENCE, &c.

The common opinion is, that *writing* only repreſents words, that its proper object is the voice, and that it only ſignifies ideas mediately, or ſecondarily; and by means of thoſe things themſelves.

Others, on the contrary, will have ideas, ſpeech, and *writing*, all equally, and immediately repreſentatives of things. See IDEA, NOTION, &c.

But the controverſy is impertinent enough!— No doubt, our ideas of things, are the things themſelves; there being no foundation for any diſtinction between them. See EXTERNAL, EXISTENCE, BODY, &c.

And as to *writing*, ſome may be ſaid to be *real*, or *ſignificative* of things and ideas.— As, the Egyptian hieroglyphics; the characters of chymiſts, aſtronomers, *&c.* which are a kind of images, or bear ſome natural reſemblance or analogy with the things they are intended to expreſs. See SYMBOL, HIEROGLYPHIC, *Real* CHARACTER, &c.

But the common *writing* only repreſents ſounds, which is the firſt and moſt natural language; and accordingly, our orthography is apparently formed on, or adapted to the pronunciation. See ORTHOGRAPHY, and PRONUNCIATION.

Hence, the end of *writing* is to excite, as it were, certain ſounds which have been made the arbitrary ſigns of certain ideas.— This they do by virtue of a combination, or aſſociation between ſuch and ſuch figures made with the pen, and ſuch and ſuch inflexions of the voice.

In effect, we have a great many *written* words which have no ideas belonging to them; as, *ſcindapſus*, *bladri*, &c. which tend no further than to produce ſounds.— Add, that people, when they begin to learn to read *writing*, take it from ſounds which they hear produced by the perſon who teaches them: an abundant argument, that writing does not immediately ſignify ideas and things; but firſt ſounds, and then things.

Gothic **WRITING**. See the article GOTHIC.

Secret **WRITING**. See CRYPTOGRAPHY, STEGANOGRAPHY, SCYTALA, CIPHER, DECIPHERING, &c.

Short **WRITING**. See the article BRACHYGRAPHY.

WRITTEN *Tradition*. See the article TRADITION.

WRONG, in a logical ſenſe. See ERROR, FALSHOOD, TRUTH, &c.

WRONG, in a legal ſenſe, *injury tort*. See INJURY, JUSTICE, TORT, RIGHT, &c.

WULVESHEVED, or WULWESHEAD. See WOLFESHEAD.

WYCH-*Houſe*, a houſe in which ſalt is boiled. See SALT.

WYDRAUGHT, a water-courſe, or water-paſſage, to carry off the filth and ſuillage of a houſe; properly a ſink, common-ſhore. See SEWER, and CLOACA.

WYKE, antiently denoted a farm, hamlet, or little village. See WIC, FARM, HAMLET, and VILLAGE.

WYTE[*], WYTA, or WITE, WITA, in our antient cuſtoms, a pecuniary penalty, or mulct.

The Saxons had two kinds of puniſhments, *were*, and *wyte*; the firſt, for the more grievous offences. See WERE.

The *wyte* was for the leſs heinous ones.— It was not fixed to any certain ſum; but left at liberty, to be varied according to the caſe.

Hence, alſo, *wyte*, or *wittree*, one of the terms of privilege granted our portſmen; ſignifying a freedom or immunity from fines, or amerciaments: or, as it is vulgarly conceived, from being liable to be begged for fools, for lack of wit.

WYTA, or WITA *Plena*, ſignified a forfeiture of one hundred and twenty ſhillings.— *Si pundbreche fiat in curia regis* plena wita *ſit*; *alibi quinque marcæ*.

To ſwear according to the *wyte*, *ſecundum* witam *jurare*, was to purge one's ſelf by the oaths of ſo many witneſſes, as the nature of the crime, and the puniſhment, or *wyte*, did require. See PURGATION.

Hence, alſo, *bloodwite*, *legerwite*, *ferdwite*, *childwite*, *wardwite*, &c. See FERDWITE, LEGERWITE, CHILDWITE, &c.

WYTHE, in law, the ſame as *waif*. See WAIF.

---

[*] — *Jurat ſecundum* witam *quod nec fuerat furti conſcius nec coadjutor in eo.* Leg. Inæ.

X.

X, A double conſonant, and the twenty-ſecond letter in the Engliſh alphabet See LETTER, CONSONANT, ALPHABET, &c.

The *x* of the Latins, and ξ of the Greeks, are compounded of *c s*, and κσ; whence to this day, the letter *x*, in the Engliſh and French, has the ſame ſound with *c s*, or *k s*. — Thus we pronounce *Alexander*, as if wrote *Alecſander*, or *Alekſander*. See C, K, S, *&c.*

The Italians have no *x* at all in their language; but, both ſpeak and write *Aleſſandro*.— The Spaniards pronounce the *x*, like our *c* before *a*; viz. *Alexandro*, as if it were *Alecandro*. — The Portugueze pronounce it like *ſh*.

In foreign words, uſed in Engliſh, we ſometimes ſoften the *x* into a double *s*; as *Bruſſels*, for *Bruxelles*, &c.

The letter is not known in the Hebrew, or other oriental languages; but, in lieu of it, they write the two ſimple letters whereof it is compounded.— And the like do the modern Germans.

X is alſo a numeral letter, and ſignifies ten; as repreſenting two V's placed one a-top of the other. See V.

> X *Sup-a denos numero tibi dat retinendos.*

When laid flat, thus ⋈ it ſignifies a thouſand; and when a daſh is added over it, $\overline{\text{X}}$, it ſignifies ten thouſand.

XENIA, in ſome antient cuſtoms, were gifts, or preſents, made to the governors of provinces, by the inhabitants thereof.

The word occurs pretty frequently in charters of privileges; where, *quietos eſſe à* xeniis, denotes an exemption from making ſuch preſents to kings and queens, upon their travelling through ſuch precincts.

XENODOCHUS, an eccleſiaſtical officer of the Greek church; the ſame with *hoſpitaler*; or a perſon who takes care of the reception and entertainment of ſtrangers. See HOSPITALER.

S. Iſidore, a prieſt and ſolitary, ſurnamed *Xenodochus*, lived in the fourth century.— He was thus called, becauſe entruſted with that office in the church of Alexandria.

XEROPHAGIA*, XEROPHAGY, in church-hiſtory, the feeding on dried foods. See FOOD.

* The word is formed from ξηρος *ſiccus*, dry, and φαγω, I eat.

In the firſt ages, ſome, not contented with ſimple faſting, added the *xerophagy* thereto; abſtaining not only from fleſh and wine, but alſo from all freſh, ſucculent, and vinous fruits.— And ſome even brought themſelves to bare bread and water. See FAST, and ABSTINENCE.

Tertullian, in his book *de Abſtinentia*, c. 9. ſpeaks of the *xerophagia*, as a thing commendable in time of perſecution.

XEROPHTHALMIA*, ΞΗΡΟΦΘΑΛΜΙΑ, a kind of ophthalmia, wherein the eyes itch, and are red, but without ſwelling, or watering. See OPHTHALMIA, and SCLEROPHTHALMIA.

* The word is compounded of ξηρος dry, and οφθαλμος, eye.

XESTA, ΞΕΣΤΗΣ, an Attic meaſure of capacity; anſwering to the Roman *ſextary*. See MEASURE, and SEXTARY.

XIPHIAS, ΞΙΦΙΑΣ, a fiery meteor, in form of a ſword. See METEOR.

It differs from the *acontias*, in that this latter is longer, and more like a dart; and the former ſhorter, and broader in the middle. See ACONTIAS.

XIPHOIDES, ΞΙΦΟΕΙΔΗΣ, in anatomy, a cartilage at the bottom of the ſternum, called alſo *enſiformis*. See CARTILAGE.

It is about an inch long, and ſhaped like the point of a ſword. — Whence its appellation, from ξιφος, ſword, and ειδος, figure. See STERNUM.

XV. VIR, *Quindecimvir*. See the article QUINDECIMVIR. Authors, and eſpecially antiquaries, make uſe of ſuch abbreviations, which they borrow from medals, and other monuments of antiquity, where thoſe names are ſo expreſſed.

XYLO-ALOE*, in medicine, the lignum aloes: called alſo *agallochum*. See ALOES.

* The word is compounded of ξυλον, *lignum*, wood, and αλοη, aloes.

XYLO-BALSAMUM*, ΞΥΛΟΒΑΛΣΑΜΟΝ, a name which naturaliſts, *&c.* give to the wood of the tree, which yields that precious gum, known to the Latins by the name of *opo-balſamum*, and among us, by the name of *balm of Gilead*. See BALSAM.

* The word is compounded of ξυλον, wood, and βαλσαμον, balſam, balm.

We have branches of this tree brought us from Cairo. They are very ſtreight, brittle, unequal, and full of knots; their bark reddiſh without, and greeniſh within.— The wood is whitiſh, and full of pith; and, when broke, yields an agreeable ſmell, reſembling that of the balm.

The *xylo-balſamum* is reputed good to ſtrengthen the brain, and ſtomach, and to expel poiſon.

XYNOECIA*, a feaſt among the antient Athenians, inſtituted on occaſion of Theſeus's uniting all the petty communities of Attica into one commonwealth; the aſſemblies whereof were to be held at Athens, in the Prytaneum. See FEAST.

* The word is formed of the Greek, ξυν, or συν, with, and οικεω, I inhabit.

XYSTARCHA, in antiquity, the maſter or director of the xyſtus. See XYSTUS, and GYMNASTICS.

In the Greek gymnaſium, the *xyſtarcha* was the ſecond officer: the firſt was the gymnaſiarcha.— The *xyſtarcha* was his lieutenant, and preſided over the two xyſti, and all exerciſes of the athletæ therein. See GYMNASIUM, and GYMNASIARCH.

XYSTUS*, in the antient architecture— A *xyſtus*, among the Greeks, was a long ſpacious portico, either open, or covered over; wherein the athletæ, and others, practiſed wreſtling, and running. See WRESTLING, &c.

* The word is Greek, ξυστος, formed of ξυειν, to poliſh, ſhave, rub.

The *xyſtus* made a neceſſary part of a gymnaſium. See GYMNASIUM.— The athletæ, who practiſed therein, were called *xyſtici*. See ATHLETA, &c.

XYSTUS, among the Romans, was an alley, or double row of trees, meeting arbor-wiſe a-top, and forming a ſhade to walk under.

Y.

Y, The twenty third-letter in the Engliſh alphabet, borrowed, originally, from the Greek υ. See LETTER, and ALPHABET.

It is occaſionally both vowel, and conſonant. — Y a vowel, ſome authors have judged it unneceſſary in our language, in regard its ſound is preciſely the ſame with that of the *i*.— Accordingly, it is but little uſed, except in words borrowed from the Greek, to denote their origin, by repreſenting the Greek ψιλον.

The vowel *y*, however, has a place even in ſome words purely Engliſh; and that both in the middle thereof, as in *dying*, *frying*, &c. and at the end, as in *lay*, &c.

Some aſcribe the uſe of the *y*, in pure Engliſh and French words, and thoſe that have no *y* in Latin or Greek, to this, that antiently each of thoſe words were pronounced with a double ii; which having ſomething awkward in it, the *y* was ſubſtituted in lieu thereof. See I.

Others ſay, that thoſe words being antiently wrote, as well as pronounced with a double ii, which they ſtill are in the Walloon, as *paiing*, *paiiſan*, &c. to avoid their being miſtaken for an u with two dots over it, they made the ſecond i longer than the firſt, and ſo formed the *y* without deſigning it. — Some give a particular reaſon, why words ending in i, came to be wrote with *y*; *viz.* that the copiſts found the tail of the *y* very commodious, to adorn the margins, and bottoms of pages withal.

When the *y* follows a conſonant, it is a vowel; and when it precedes a vowel, it is a conſonant, and ſhould be called *ye*, and not *wy*.

The Romans uſed the *y* for the vowel *u*, which they had no character for, diſtinct from the v conſonant: their way being to pronounce the common *u*, as we do the diphthong *ou*; and the Greek υψιλον, as the Engliſh and French *u*.

In our own, and ſome other modern tongues, authors begin to diſpenſe more and more with the preciſe orthography, which requires all words that have an upſilon, in the Greek, to be wrote with a *y*. And with reaſon; ſince our Greek *y* has loſt the ſound it had, in the language whence we borrow it.— But it is certainly ridiculous to uſe it, as many do, in words which indeed have a Greek origin, but have no *u* in the Greek; as in *eclipſe*. See ECLIPSE, ECLIPTIC, &c.

Y is alſo a numeral letter, ſignifying 150, or, according to Baronius, 159; as in the verſe.

Y *dat centenos & quinquaginta novenos.*

When a daſh was added a-top, $\overline{\text{Y}}$, it ſignified 150 thouſand. — Pythagoras uſed the Y as a ſymbol of human life; the foot repreſenting infancy, and the forked top the two paths of vice and virtue, one or the other of which people are to enter upon, after attaining to the age of diſcretion.

YACHT, or YATCH, a kind of veſſel uſed by the Engliſh, furniſhed with maſts, and ſails; fit to go to ſea; and commodiouſly contrived and adorned, withinſide and without, to ſuit for ſtate-paſſengers, *&c.*

* The word ſeems derived from the Dutch *Iacht*, hunting, by reaſon of the lightneſs of theſe veſſels.

Yachts are veſſels with one deck, carrying from 4 to 12 guns, with from 20 to 40 men; being of burden from 30 to 160 tun.— They draw little water, and are uſed for running, and making ſhort trips, *&c.* — Their make and form is various.

The Dutch have alſo *yachts*, but not ſo well prepared to live at ſea.— They are ſeldom uſed, but to ſail on rivers and canals.

YARD, *Virga*, a long meaſure, uſed in England, and Spain; chiefly to meaſure cloth, ſtuffs, *&c.* See MEASURE, VERGE, VIRGA, &c.

The Engliſh *yard* contains three feet.— It was firſt ſettled by Henry I. from the length of his own arm. See FOOT, &c.

The Engliſh *yard* is juſt ſeven ninths of the Paris ell; ſo that nine *yards* make ſeven ells.— To reduce ells, therefore, into *yards*, ſay, if ſeven ells give nine *yards*, how many *yards* will the given number of ells give?

Yards are converted into ells Flemiſh, by adding a third part; into ells Engliſh, by ſubſtracting a fifth part; or multiplying by 8, and caſting off the right-hand figure.— Ells Engliſh are converted into *yards*, by adding a fourth.— To turn ells Flemiſh into *yards*, ſubſtract one quarter. See ELL.

The Spaniſh vara, or *yard*, chiefly uſed at Sevil, is, in ſome places, called *barra*.— It contains $\frac{17}{24}$ of the Paris ell; ſo that 17 ells make 24 Spaniſh *yards*.

YARD, in anatomy, the penis, or virile member; ſerving for the evacuating of the urine, and ſeed. See PENIS; ſee alſo URINE, and SEED.

YARD-LAND*, *Virgata terræ*, or *virga terræ*, is a certain quantity of land, various according to the place.— At Wimbleton in Surrey, it is only 15 acres; but in moſt other countries it contains 20, in ſome 24, in ſome 30, and in others 40, to 45 acres. See ACRE.

* *Virgata terræ continet 24 acras; & 4 virgatæ conſtituunt unam hidam, & quinque hidæ conſtituunt feodum militare.* M. Abbat. Malmeſ. See HIDE, KNIGHT'S *Fee*, PLOW-*Land*, &c.

YARDS, or *Sail*-YARDS, of a ſhip, are long pieces of timber, tapering at each end, fitted acroſs the ſeveral maſts, to carry the ſails. See MAST, and SAIL.

The ſails are faſtened to the *yards* at the heads; ſo as to be hoiſted up, and let down together with them, by ropes called *halliards*. See HALLIARD.

The main *yard*, is that of the main-maſt.—The mizzen *yard*, the bolt-ſprit *yard*, &c. are thoſe of the mizzen, *&c.*— See *Tab. Ship*, *fig.* 1. *n.* 2. 20. 37. 44. 67. 86. 95. 109. 126. 138. See alſo MIZZEN, BOWSPRIT, &c.

They have ſeveral phraſes, and words of command, relating to the management of the *yards*; as — *Brace the yard*, which ſignifies to traverſe aft the *yard*-arm, whoſe brace is haled; ſo that to *traverſe the yard*, is the ſame as to ſay, brace it aft.— *Square the yard*, is as much as to ſay, ſee that it hang right a-croſs the ſhip, and one *yard*-arm not traverſed more than the other.— *Top the yards*, that is, make them hang even.

YARD-*Arm*, is that half of the *yard* which is on either ſide the maſt, when it lies athwart the ſhip.

YARDS alſo denote places belonging to the navy, where the ſhips of war, *&c.* are laid up in harbour. See NAVY, HARBOUR, SHIP, &c.

The king's *yards*, are Chatham, Deptford, Woolwich, Portſmouth, Shereneſs, Plimouth, and Harwich; each of which is provided with ſeveral docks, wharfs, launches, and graving places for the building, repairing, and cleaning his majeſty's ſhips. See DOCK, WHARF, &c.

In theſe *yards* are alſo lodged great quantities of timber, maſts, planks, anchors, *&c.* There are alſo ſtore-houſes belonging to each *yard*, wherein are reſerved vaſt quantities of cables, rigging, ſails, blocks, *&c.*

In the ſeveral *yards* are great rope-*yards*, wherein cables, and all ſorts of cordage are made. See CORDAGE, CABLE, &c.

YARE, among ſailors, implies as much as, nimble, ready, quick, expeditious. — Hence, to *be yare at the helm*, as ſome ſay, ſignifies to ſet a freſh man at the helm.

YARN, denotes ſpun wool. See WOOL, SPINNING, CLOTH, &c.

Rope-YARN. See the article ROPE.

YARRINGLES, or YARRINGLE *Blades*, a kind of reel, or inſtrument, with which hanks of yarn are wound on to clues, or balls. See REEL.

YATCHES. See the article YACHT.

YAWS, or YAWES, in the ſea-language.— A ſhip is ſaid to make *yawes*, when, through the fault of him at the helm, ſhe is not kept ſteady in her courſe; but makes angles in and out. See HELM, RUDDER, STEERING, &c.

To prevent this, the conner cries to him at the helm, *ſteady, ſteady*. See STEADY.

YAWNING, *Oſcitatio*, an involuntary opening of the mouth, occaſioned by a vapour, or ventoſity, endeavouring to eſcape; and generally witneſſing an irkſome wearineſs, or an inclination to ſleep.

The remedy Hippocrates preſcribes againſt continual *yawnings*, is to make long breathings, or reſpirations.— The ſame he recommends againſt the hiccough. See HICCUP.

The nervous membrane of the oeſophagus, has been held the ſeat of *yawning*, which, according to the uſual ſyſtem, is produced, whenever any irritation determines the ſpirits to flow thither in too great abundance. — The cauſe of the irritation is ſuppoſed to be ſome troubleſome humour, wetting the inner membrane of the oeſophagus; which humour may proceed either from the glands ſpread throughout the membrane, or from acid vapours ariſing from the ſtomach, and condenſing on the ſides of the oeſophagus. — By ſuch means, the nervous fibres of the membrane of the gullet being irritated, dilate the gullet; and the mouth is conſtrained to follow the ſame motion, as being lined with the ſame membrane. — But this ſyſtem of oſcitation has, of late, given way to a better, and more mechanical one.

Yawning is performed by expanding almoſt all the muſcles of voluntary motion at the ſame time; but moſt conſiderably thoſe of the lungs: by ſpringing a great quantity of air, very ſlowly, and after retaining it ſome time, and rareſying it, by expelling it again, ſlowly, and reſtoring the muſcles to their natural ſtate.

Hence, its effects are to move, accelerate, and diſtribute all the humours of the body, equably through all the veſſels; thereby diſpoſing the organs of ſenſation, and all the muſcles of the body, for the performance of their reſpective functions. *Vid.* Boerh. Inſt. Med. §. 638.

YCONOMUS. See the article OECONOMUS.

YDRARGYROS, HYDRARGYROS, or *Quickſilver.* See MERCURY.

YEAR, *Annus*, in the full extent of the word, is a ſyſtem, or cycle of ſeveral months; uſually twelve. See CYCLE, and MONTH.

Others define *year*, in the general, a period, or ſpace of time, meaſured by the revolution of ſome celeſtial body in its orbits. See TIME, and PERIOD.

Thus, the time wherein the fixed ſtars make a revolution, is called the *great year*. And the times wherein Jupiter, Saturn, the Sun, Moon, *&c.* finiſh their revolutions, and return to the ſame point of the zodiac, are reſpectively called the *years of Jupiter*, and *Saturn*; the *Solar*, and the *Lunar years*. See SUN, MOON, PLANET, &c. *Solar* YEAR, *Lunar* YEAR, &c.

Year, properly, and by way of eminence ſo called, is the *ſolar year*; or the ſpace of time wherein the ſun moves through the twelve ſigns of the ecliptic. See ECLIPTIC.

This, by the obſervations of Caſſini, Bianchini, and de la-Hire, contains 365 days, 5 hours, and 49 minutes; which is the quantity of the *year* aſſumed by the authors of the Gregorian calendar. See *Solar* YEAR.

But, in the civil, or popular account, this *year* only contains 365 days; except every fourth, which contains 366. See *Civil* YEAR.

The viciſſitude of ſeaſons ſeems to have given occaſion to the firſt inſtitution of the *year*.— Man, naturally curious to know the cauſe of that diverſity, ſoon found it was the proximity and diſtance of the ſun; and upon this, gave the name *year* to the ſpace of time wherein that luminary, performing his whole courſe, returned to the ſame point of his orbit. See SEASON.

And hence, as it was on account of the ſeaſons, in a great meaſure, that the *year* was inſtituted, their chief regard and attention was, that the ſame parts of the *year* ſhould always correſpond to the ſame ſeaſons; *i. e.* that the beginning of the *year* ſhould always be when the ſun was in the ſame point of his orbit; and that they ſhould keep pace, come round, and end together.

This, different nations aimed to attain by different ways; making the *year* to commence from different points of the zodiac; and even the time of his progreſs different. So that ſome of their *years* were much more perfect than others, but none of them quite juſt; *i. e.* none of them but whoſe parts ſhifted, with regard to the parts of the ſun's courſe.

It was the Egyptians, if we may credit Herodotus, that firſt formed the *year*, making it to contain 360 days; which they ſubdivided into 12 months.

Mercury Triſmegiſtus added five days more to the account. — And, on this footing, Thales is ſaid to have inſtituted the *year* among the Greeks. Though that form of the *year* did not hold throughout all Greece.— Add, that the Jewiſh, Syrian, Roman, Perſian, Ethiopic, Arabic, *&c. years*, were all different.

In effect, conſidering the poor ſtate of aſtronomy in thoſe ages, it is no wonder different people ſhould diſagree in the calculus of the ſun's courſe.— We are even aſſured by Diod. Siculus, Lib. I. Plutarch. *in Numa*, and Pliny, Lib. VII. c. 48. that the Egyptian *year* itſelf was at firſt very different from that now repreſented. See *Egyptian* YEAR, *Roman* YEAR, *Jewiſh* YEAR, &c.

Solar YEAR, is the interval of time wherein the ſun finiſhes his courſe through the zodiac; or, wherein he returns to the ſame point thereof whence he had departed. See SUN.

This, according to our account, is 365 days, 5 hours, 49 minutes; though ſome aſtronomers make a few ſeconds, and ſome a whole minute leſs; as Kepler, for inſtance, who makes it 365 days, 5 hours, 48 minutes, 57 ſeconds, 39 thirds.— Ricciolus, 365 days, 5 hours, 48 minutes; and Tycho Brahe, 365 days, 5 hours, 48 minutes.

The *ſolar year* is either *aſtronomical*, or *civil.*

Solar aſtronomical YEAR, is that determined preciſely by the obſervations of aſtronomy; and is of two kinds, *tropical*, and *ſiderial*, or *aſtral.*

Tropical, or *Natural* YEAR, is the time which the ſun employs in paſſing through the zodiac; which, as before obſerved, is 365 days, 5 hours, 49 minutes.

Siderial, or *aſtral* YEAR, is the ſpace of time wherein the ſun, going from any fixed ſtar, returns to the ſame.— This conſiſts of 365 days, 6 hours, 10 minutes. See SIDERIAL.

Civil YEAR, is that form of *year* which each nation has contrived to compute time by: or the *civil* is the tropical *year*, conſidered as only conſiſting of a certain number of whole days; the odd hours and minutes being ſet aſide, to render the computation of time, in the common occaſions of life, more eaſy. See CIVIL.

Hence, as the *tropical year* is 365 days, 5 hours, 49 minutes, the *civil year* is 365 days.— And hence, alſo, as it is neceſſary to keep pace with the heavens, it is required that every fourth *year* conſiſts of 366 days.

Hence, laſtly, the *civil year* is either *common*, or *biſſextile.*

The common civil YEAR, is that conſiſting of 365 days.— This, therefore, has ſeven months of 30 days each, and five of 31 days.

Biſſextile, or *Leap* YEAR, is that conſiſting of 366 days; or has one day extraordinary; which day is called the *intercalary*, or *biſſextile day*. See INTERCALARY, and LEAP-*Year*.

This intercalary, or additional day to every fourth *year*, was firſt appointed by Julius Cæſar; who, to make the *civil years* keep pace with the tropical ones, contrived that the ſix hours which the former came ſhort of the latter, ſhould, in four *years*, make a whole day, and be added after the twenty-fourth of February, which was their ſixth of the calends of March.

Hence, as, in that *year*, they reckoned this day twice over, or had *bis ſexto calendas*, the *year* itſelf came to be called *bis ſextus*, and *biſſextile.*

The intercalary day, however, among us, is not got in by telling the twenty-fourth of February twice over; but by adding a day after the twenty-eighth of February; which month, that *year*, comes to contain twenty-nine days. See BISSEXTILE.

A further reformation, in this *year*, was made by pope Gregory. See *Gregorian* YEAR.

Lunar YEAR, is a ſyſtem of twelve lunar months. See LUNAR.

Hence, from the two kinds of ſynodical lunar months, there ariſe two kinds of *lunar years*; the one *aſtronomical*, the other *civil.*

Lunar aſtronomical YEAR, conſiſts of twelve lunar ſynodical months; and therefore contains 354 days, 8 hours, 48 minutes, 38 ſeconds, 12 thirds. See SYNODICAL.

Lunar civil YEAR, is either *common*, or *emboliſmic.*

The common Lunar YEAR, conſiſts of twelve lunar civil months; and therefore contains 354 days.

The emboliſmic, or *intercalary* YEAR, conſiſts of thirteen lunar civil months; and therefore contains 384 days. See EMBOLISMIC.

Note, as the difference between the common lunar civil *year* and the tropical *year* is 11 days, 5 hours, and 49 minutes; to have the former keep pace with the latter, there are 34 months of 30 days, and 4 months of 31 days each, to be inſerted in every 100 lunar *years*; which ſtill leave behind them an appendix of 4 hours, 21 minutes, which in ſix centuries make nearly a day more.

Thus far we have conſidered *years* and months, with a view to the principles of aſtronomy, whereon the diviſion is founded.— By this, the various forms of civil *years* that have antiently obtained, or ſtill do obtain, in divers nations, are to be examined.

Antient Roman YEAR, was the *lunar year*, which, as firſt ſettled by Romulus, only conſiſted of ten months; *viz.* 1°. March, containing 31 days. 2°. April, 30. 3°. May, 31. 4°. June, 30. 5°. Quintilis, 31. 6°. Sextilis, 30. 7°. September, 30. 8°. October, 31. 9°. November, 30. 10°. December, 30; in all 304 days; which came ſhort of the true lunar *year* by 50 days; and of the ſolar, by 61 days.

Hence, the beginning of Romulus's *year* was vague, and unfixed to any preciſe ſeaſon; which inconvenience to remove, that prince ordered ſo many days to be added yearly as would make the ſtate of the heavens correſpond to the firſt month, without incorporating theſe additional days, or calling them by the name of any month.

Numa Pompilius corrected this irregular conſtitution of the *year*, and compoſed two new months, January and February, of the days that were uſed to be added to the former *year*.— Thus, Numa's *year* conſiſted of twelve months; *viz.* 1°. January, containing 29 days. 2°. February, 28. 3°. March, 31. 4°. April, 29. 5°. May, 31. 6°. June, 29. 7°. Quintilis, 31. 8°. Sextilis, 29. 9°. September, 29. 10°. October, 31. 11°. November, 29. 12°. December, 29; in all 355 days; which exceeds the quantity of a lunar civil *year* by one day; and that of a lunar aſtronomical *year*, by 15 hours, 11 minutes, 24 ſeconds; but came ſhort of the common ſolar *year* by ten days; ſo that its beginning was vague, and unfixed.

Numa, however, deſiring to have it fixed to the winter-ſolſtice, ordered 22 days to be intercalated in February every ſecond year, 23 every fourth, 22 every ſixth, and 23 every eighth *year*.

But this rule failing to keep matters even, recourſe was had to a new way of intercalating; and inſtead of twenty-three days every eighth *year*, only fifteen were added; and the care of the whole committed to the pontifex maximus; who, neglecting the truſt, let things run to the utmoſt confuſion.— And thus the Roman *year* ſtood till Julius Cæſar made a reformation. See *Julian* YEAR.

For the manner of reckoning the days of the Roman months, ſee CALENDS, NONES, and IDES.

Julian YEAR, is a ſolar *year*, containing, commonly, 365 days; though every fourth *year*, called *biſſextile*, contains 366. See BISSEXTILE.

The months, *&c.* of the Julian *year* ſtand thus: 1°. January, 31 days. 2°. February, 28. 3°. March, 31. 4°. April, 30. 5°. May, 31. 6°. June, 30. 7°. July, 31. 8°. Auguſt, 31. 9°. September, 30. 10°. October, 31. 11°. November, 30. 12°. December, 31.— But, every *biſſextile year*, a day is added after the 28th of February; which month, then, contains 29 days.

The aſtronomical quantity, therefore, of the *Julian year*, is 365 days, ſix hours, which exceeds the true ſolar *year* by eleven minutes; which exceſs, in 131 *years*, amounts to a whole day.— And thus the Roman *year* ſtood, till the reformation made therein by pope Gregory. See *Gregorian* YEAR.

For this form of the *year*, we are indebted to Julius Cæſar; who, in the contrivance thereof, was aſſiſted by Soſigenes, a famous mathematician, called over from Egypt for this very purpoſe; who, to ſupply the defect of ſixty-ſeven days, which had been loſt through the fault of the pontifices, and to fix the beginning of the *year* to the winter ſolſtice, made that *year* to conſiſt of fifteen months, or 445 days; which, for that reaſon, is uſed to be called *annus confuſionis*, the *year of confuſion*.

This form of the *year* was uſed in all Chriſtian nations, till the middle of the ſixteenth century; and ſtill continues to be ſo, not only by ſeveral nations (and, among the reſt, by the Engliſh, Swedes, Danes, *&c.*) but alſo by the modern aſtronomers, and chronologers.— For, ſince the error is known, there is no danger from it.

Gregorian YEAR, is the *Julian year* corrected by this rule; that, whereas on the common footing, every ſecular or hundredth *year*, is biſſextile; on the new footing, three of them are common *years*, and only the fourth biſſextile.

The error of eleven minutes in the *Julian year*, little as it was, yet, by being repeated over and over, at length became conſiderable; and from the time when Cæſar made his correction, was grown into thirteen days, by which means the equinoxes were greatly diſturbed.— To remedy this irregularity, which was ſtill a-growing, pope Gregory XIII. called together the chief aſtronomers of his time, and concerted this correction; and, to reſtore the equinoxes to their place, threw out the ten days that had been got from the time of the council of Nice, and which had ſhifted the fifth of October to the fifteenth.

In the *year* 1700, the error of ten days was grown to eleven; upon which the Proteſtant ſtates of Germany, to prevent further confuſion, accepted the Gregorian correction. See CALENDAR, STYLE, &c.

Yet is the *Gregorian year* far from being perfect; for we have ſhewn, that, in four centuries, the *Julian year* gains three days, one hour, twenty minutes: but it is only the three days are kept out in the *Gregorian year*; ſo that here is ſtill an exceſs of one hour, twenty minutes, in four centuries; which, in ſeventy-two centuries amounts to a whole day. See EASTER.

Egyptian YEAR, called alſo the *year of Nabonaſſar*, is the ſolar *year* of 365 days, divided into twelve months, of thirty days each, beſides five intercalary days added at the end.

The names, *&c.* of the months are as follows: 1°. Thot. 2°. Paophi. 3°. Athyr. 4°. Chojac. 5°. Tybi. 6°. Mecheir. 7°. Phamenoth. 8°. Pharmuthi. 9°. Pachon. 10°. Pauni. 11°. Epiphi. 12°. Meſori; beſide the ημεραι επαγομεναι.

Hence, as the *Egyptian year*, in every four *years*, loſes a whole day of the *Julian year*, its beginning, in the ſpace of 460 *years*, runs through every part of the *Julian year*; which ſpace elapſed, they meet again.

This *year* is uſed by Ptolemy in his *Almageſt*; ſo that the knowledge thereof, is of uſe in aſtronomy, for comparing the antient obſervations with the modern.

The antient Egyptians, we are told by Diodorus Siculus, Lib. I. Plutarch, in the life of *Numa*, and Pliny, Lib. VII. c. 48. meaſured their *years* by the courſe of the moon.— At firſt, they were only one month; then three; then four, like that of the Arcadians; and then ſix, like that of the people of Acarnania.— Thoſe authors add, that it is on this account, they reckon ſuch a vaſt number of *years* from the beginning of the world; and that in the hiſtory of their kings, we meet with ſome who lived 1000, or 1200 *years*. But Herodotus is ſilent on this point: he only ſays, that the Egyptian *year* conſiſted of 12 months, as we have above repreſented it.— Beſides, we learn from ſcripture, that, from the times of the flood, the *year* was compoſed of 12 months: Cham, conſequently, and his ſon Miſraim, the founder of the Egyptian monarchy, muſt have had that cuſtom; and it is no way probable his deſcendants ſhould alter it.— Add, that Plutarch ſpeaks of it with a deal of uncertainty; and as no more than a report: and Diod. Siculus, as only a conjecture of I know not what authors, whom he does not name; and who, in all probability, might have framed this hypotheſis, to reconcile the Egyptian chronology with that of ſome other nations.

F. Kircher, however, maintains, that beſides the ſolar *year*, there were ſome of the names, or cantons of Egypt, who uſed a lunar one; and that, in the remoteſt ages, there were ſome who took a revolution of the moon, that is, a month, for a *year*; and others, who finding the *year* too ſhort, made it two months, others three, and others four, *&c. Oedip. Egypt.* Tom. II. p. 252.

A late author obſerves, that Varro has affirmed of all nations, what we have here quoted of the Egyptians; and adds, that Lactantius takes him to taſk on that ſubject.— We do not know in what places of Varro, or Lactantius, he has ſeen this: all we can ſay, is, that Lactantius, *Divin. Inſt.* Lib. II. c. 13. where he gives Varro's opinion, only repreſents him as ſpeaking of the Egyptians.— However, S. Auguſtin, *de Civit. Dei*, l. 15. c. 14. ſhews, that the *years* of the patriarchs mentioned in ſcripture, are like ours, and not one of ours equal to ten of theirs, as, it appears, had been the opinion of ſome people.

Upon the Egyptians being ſubdued by the Romans, they received the *Julian year*; though with ſome alteration; for they ſtill retained their antient months, with the five ημεραι επαγομεναι, and, every fourth *year*, intercalated another day between the 28th and 29th of Auguſt.— Add, that the beginning of their *year* anſwered to the 29th of Auguſt of the *Julian year*.

This *year*, thus reformed, was called the *annus Actiacus*, as being inſtituted ſoon after the battle of Actium. See ACTIAN.

Antient Greek YEAR, was lunar; conſiſting of 12 months, which at firſt was 30 days a-piece, then alternately 30, and 29 days, computed from the firſt appearance of the new moon; with the addition of an emboliſmic month of 30 days, every 3d, 5th, 8th, 11th, 14th, 16th, and 19th *years* of a cycle of 19 *years*; in order to keep the new and full moons, to the ſame terms or ſeaſons of the *year*. See EMBOLISMIC.

Their *year* commenced at the full moon next after the ſummer ſolſtice.— The order, *&c.* of their months was thus: 1°. Εκατομβαιων, containing 29 days. 2°. Μεταγειτνιων, 30. 3°. Βοηδρομιων, 29. 4°. Μαιμακτηριων, 30. 5°. Πυανεψιων, 29. 6°. Ποσειδεων, 30. 7°. Γαμηλιων, 29. 8°. Ανθεστηριων, 30. 9°. Ελαφηβολιων, 29. 10°. Μυνυχιων, 30. 11°. Θαργηλιον, 29. 12°. Σκιρρωφοριων, 30.

The Macedonians had other names for their months: ſo had the Syro-Macedonians, Smyrnæans, Tyrians; ſo alſo the Cypriots, Paphians; and ſo the Bithynians, *&c.* See *Macedonic* YEAR.

Antient Macedonian YEAR, is a lunar *year*, only differing from the Attic, in the names and order of the months; the firſt Macedonian month, agreeing with the Attic mæmacterion.— The months ſtand thus: 1°. Διος, 30 days. 2°. Απελλαιος, 29. 3°. Αυδυναιος, 30. 4°. Περιτιος, 29. 5°. Δυστρος, 30. 6°. Ξανθικος, 29. 7°. Αρτεμισιος, 30. 8°. Δαισιος, 29. 9°. Πανεμος, 30. 10°. Λωος, 29. 11°. Γορπιαιος, 30. 12°. Υπερβερεταιος, 29.

Modern Macedonian YEAR, is a ſolar *year*, whoſe beginning is fixed to the firſt of January of the *Julian year*, with which it perfectly agrees.

This year was particularly called the *Attic year*; and the intercalary month, after poſideon, was called ποσειδεων β, or *latter poſideon*.

Antient Jewiſh YEAR, is a lunar *year*, conſiſting, commonly, of eleven months, which alternately contain 30 and 29 days.

It was made to agree with the ſolar *year*, either by the adding of 11, and ſometimes 12 days at the end of the *year*, or by an emboliſmic month.

The names and quantities of the months ſtand thus: 1°. Niſan, or Abib, 30 days. 2°. Jiar, or Zius, 29. 3°. Sivan, or Siwan, 30. 4°. Thamuz, or Tamuz, 29. 5°. Ab, 30. 6°. Elul, 29. 7°. Tiſri, or Ethanim, 30. 8°. Marcheſvam, or Bul, 29. 9°. Ciſleu, 30. 10°. Tebeth, 29. 11°. Sabat, or ſchebeth, 30. 12°. Adar, in the emboliſmic *year*, 30. Adar, in the common *year*, was but 29. Note, in the defective *year*, Ciſleu was only 29 days; and in the redundant *year*, Marcheſvam was 30.

Modern Jewiſh YEAR, is likewiſe lunar, conſiſting, in common *years*, of 12 months, but of 13 in emboliſmic *years*; which, in a cycle of 19 *years*, are the 3d, 6th, 8th, 11th, 14th, 17th, and 19th.— Its beginning is fixed to the new moon next after the autumnal equinox.

The names, *&c.* of the months are, 1°. Tiſri, containing 30 days. 2°. Marcheſvan, 29. 3°. Ciſleu, 30. 4°. Tebeth, 29. 5°. Schebeth, 30. 6°. Adar, 29. 7°. Veadar, in the emboliſmic *year*, 30. 8°. Niſan, 30. 9°. Ijar, 29. 10°. Sivan, 30. 11°. Thamuz, 29. 12°. Ab, 30. 13°. Elul, 29.

Syrian YEAR, is a ſolar *year*, having its beginning fixed to the beginning of October in the Julian *year*; from which it only differs in the names of the months, the quantities being the ſame; as follows:

1°. Tiſhrin, anſwering to our October, and containing 31 days. 2°. Latter Tiſhrin, containing, like our November, 30. 3°. Canun, 31. 4°. Latter Canun, 31. 5°. Shabat, 28. 6°. Adar, 31. 7°. Niſan, 30. 8°. Aiyar, 31. 9°. Haziram, 30. 10°. Tamuz, 31. 11°. Ab, 31. 12°. Elul, 30.

Perſian YEAR, is a ſolar *year*, of 365 days, conſiſting of 12 months of 30 days each, with 5 intercalary days added at the end.

The months are as follow: 1°. Afrudia meh. 2°. Ardihaſcht meh. 3°. Cardi meh. 4°. Thir meh. 5°. Merded meh. 6°. Schabarir meh. 7°. Mehar meh. 8°. Aben meh. 9°. Adar meh. 10°. Di meh. 11°. Behen meh. 12°. Affirer meh.

This *year* is called the *yezdegerdic year*, to diſtinguiſh it from the fixed ſolar *year*, called the *gelalean year*, which the Perſians began to uſe in the *year* 1079; and which was formed by an intercalation made ſix or ſeven times in four *years*, and then once every fifth *year*.

The yezdegerdic *year*, it may be obſerved, is the ſame with Nabonaſſar's *year*.— As to the *gelalean year*, it is abſolutely the beſt and juſteſt of all the civil *years* yet invented, as being found, by calculation, to keep the ſolſtices and equinoxes preciſely to the ſame days, and anſwering very accurately to the ſolar motions; which no other civil *year* does, not even the Gregorian, for want of ſo commodious an intercalation.

Arabic, and *Turkiſh* YEAR, is a lunar *year*, conſiſting of 12 months, which contain, alternately, 30, and 29 days.

Though, ſometimes it contains 13 months; the names, *&c.* whereof are as follow: 1°. Muharram, containing 30 days. 2°. Saphar, 29. 3°. Rabia, 30. 4°. Latter Rabia, 29. 5°. Jomada, 30. 6°. Latter Jomada, 29. 7°. Rajab, 30. 8°. Shaaban, 29. 9°. Samadan, 30. 10°. Shawal, 29. 11°. Dulkaadah, 30. 12°. Dulheggia, 29; and in the emboliſmic *year*, 30.— An intercalary day is added every 2d, 5th, 7th, 10th, 13th, 15th, 18th, 21ſt, 24th, 26th, 29th, in a cycle of 29 *years*.

Ethiopic YEAR, is a ſolar *year* perfectly agreeing with the Actian, except in this, that the names of the months are different.— It commences with the Egyptian *year*, on the 29th of Auguſt of the Julian *year*.

Its months are, 1°. Maſcaram. 2°. Tykympt. 3°. Hydar. 4°. Tyſhas. 5°. Tyr. 6°. Jacatit. 7°. Magabit. 8°. Mijazia. 9°. Ginbat. 10°. Syne. 11. Hamle. 12°. Hahaſe. Intercalary days 5.

Metonic YEAR.	See the article	METONIC.
Actian YEAR.		ACTIAN.
Attic YEAR.		*Macedonian* YEAR.
Yezdegerdic YEAR.		*Perſian* YEAR.
Gelalean YEAR.		*Perſian* YEAR.

Nabonaſſar's YEAR. See EGYPTIAN *Year*, and NABONASSAR.

Sabbatic YEAR, *Annus ſabbaticus*, among the antients, was every ſeventh *year*; during which, the Jews let their land lie at reſt. See SABBATH.

Every ſeventh *ſabbatic year*, *i. e.* every 49th *year*, was called the *year of jubilee*; and held with ſolemnity extraordinary. See JUBILEE.

Anomaliſtical YEAR.	See the article	ANOMALISTICAL.
Climacteric YEAR.		CLIMACTERIC.
Emergent YEAR.		EMERGENT.
Enneatical YEAR.		ENNEATICAL.
Holy YEAR.		HOLY.
Platonic, or *great* YEAR.		PLATONIC.
YEAR *of the Hegira*.		HEGIRA.

New YEAR's *day*, or the day wherein the *year* commences, has always been very different, in different nations, and yet in all held in great veneration.

Among the Romans, the firſt and laſt day of the *year* were conſecrated to Janus; on which account it was, that they repreſented him with two faces.

To them we owe the ceremony of wiſhing *a happy new year*; which appears to be very antient.— Before the firſt day was ſpent, they not only viſited and complimented each other, but alſo preſented ſtrenæ, and offered vows to the gods for the preſervation of each other.— Lucian repreſents it as a practice of a very antient ſtanding, even in his time; and refers it to Numa. See STRENÆ, VOW, *&c.*

Ovid intimates the ſame ceremony, in the beginning of his *Faſti*.

> *Poſtera lux oritur, linguiſque animiſque favete:*
> *Nunc dicenda bono, ſunt bona verba die.*

And Pliny, more expreſly, Lib. XXVIII. cap. 1. *Primum anni incipientis diem lætis precationibus invicem fauſtum ominantur.*

The civil, or *legal* YEAR, in England, commences on the day of the annunciation, *i. e.* on the 25th day of March; though the hiſtorical *year* begins on the day of the circumciſion, *i. e.* the firſt of January, on which day the German and Italian *year* alſo begins.— Stow obſerves, that William the conqueror, having been crowned on the firſt of January, that thenceforth became the firſt of the *year* for hiſtorians, *&c.* Though, in all civil affairs, they retained the antient manner of accounting, which began with the 25th of March. See CIRCUMCISION, NATIVITY, &c.

The part of the *year* between thoſe terms is uſually expreſſed both ways, as $172\left\{\frac{4}{5}\right.$ or $172\frac{4}{5}$.— Since the conqueror, the king's patents, charters, proclamations, *&c.* are uſually dated by the *year* of the king's reign.

The church, as to her ſolemn ſervice, begins the *year* on the firſt Sunday in advent, which is always that next S. Andrew's day, or the 30th of November. See ADVENT.

The Jews, as moſt other nations of the eaſt, had a civil *year*, which commenced with the new moon in September; and an eccleſiaſtical *year*, which commenced from the new moon in March.

The French *year*, during the reigns of the Merovingian race, began on the day whereon the troops were reviewed; which was the firſt day of March.— Under the Carlovingians it began on Chriſtmas-day; and, under the Capetians, on Eaſter-day; which, therefore, varied between the 22d of March, and the 25th of April.

And this is ſtill the beginning of the French eccleſiaſtical *year*.— But for the civil, Charles IX. appointed in 1564, that for the future it ſhould commence on the firſt of January.

The Mahometans begin their *year* the minute the ſun enters aries.— The Perſians in the month anſwering to our June. The Chineſe, and moſt of the Indians, begin it with the firſt moon in March.— The Brachmans begin it with the new moon in April; on which day they hold a feaſt called *ſamwat ſaradi pauduga*, *q. d.* feaſt of *New-year's day*.— The Mexicans, according to d'Acoſta, begin the *year* on our 23d of February, when the leaves begin to grow green.— Their *year* conſiſts of 18 months, 20 days each: which making 360 days, the remaining five days are ſpent in mirth, and no buſineſs ſuffered to be done, nor even any ſervice at the temples.— Alvarez relates much the ſame of the Abyſſinians; who begin their *year* on the 26th of Auguſt, and have five idle days at the end, which they call *pagomen*.—At Rome there are two ways of computing the *year*; the one beginning at the nativity of our Lord: this the notaries uſe, dating à nativitate. The other in March, on occaſion of the incarnation; and it is by this the bulls are dated, anno incarnationis.— The Greeks begin their *year* of the world from the firſt of September. See INCARNATION.

Years are alſo diſtinguiſhed with regard to the epocha's whence they are numbered: thus, *years of our Lord*, are thoſe reckoned from the birth of Jeſus Chriſt, which are now 1727.— *Years of the world*, are thoſe elapſed ſince the creation, which Scaliger makes to be 5676.— *Years of Rome*, *of the Hegira*, *of Nabonaſſar*, &c. See the difference between theſe *years*, under the article EPOCHA.

YEAR *and Day*, in law, *&c.* is a time that determines a right in many caſes, and is in ſome an uſucaption, and in others a preſcription. See PRESCRIPTION, &c.

Thus, in the caſe of an eſtray, if the owner, proclamation being made, challenge it not within a *year and day*, it is forfeit. In like manner is the *year and day* given in caſes of appeal, of deſcent, of entry or claim, of non-claim upon a fine, or writ of right, of the death of a man ſore bruiſed, or wounded; of protections, eſſoins in reſpect of the king's ſervice; of a wreck, *&c.* See APPEAL, WRECK, &c.

YEAR *Day and Waſte*, *annus dies & vaſtum*, is a part of the king's prerogative, whereby he challenges the profits of the lands and tenements of perſons attainted for petit-treaſon, or felony, for the ſpace of a *year* and a day; whoſoever is lord of the manour to which they belong.

Not only this, but at the end thereof he may waſte the tenements, deſtroy the houſes, root up the woods, gardens, paſture, and plow up the meadows, unleſs the lord of the fee agree with him for the redemption of ſuch waſte.— After the *year day and waſte*, they are to be reſtored to the lord of the fee.

YEARN, in hunting, ſignifies to bark, as beagles properly do, at their prey. See HUNTING.

YELK. See the article YOLK.

YELLOW *, a bright colour, reflecting the moſt light of any after white. See COLOUR, and LIGHT.

* The word is formed from the Italian *giallo*, or the German *geel*, which ſignifies the ſame; or from the Latin *galbanus*, bright, gay.

There are divers *yellow* ſubſtances that become white, upon wetting and drying them again ſeveral times in the ſun: As wax, linen-cloth, &c. See BLEACHING; ſee alſo HAIR, &c.

The ſame bodies, if they be already white, and continue a long time in the air without being wetted, turn *yellow*.

Paper and ivory applied near the fire, become ſucceſſively *yellow*, red, and black.— Silk, when turned *yellow*, is whitened again with the fumes of ſulphur. See WHITE, WHITENESS, &c.

YELLOW, in dying, is one of the five ſimple and mother colours. See COLOUR, and DYING.

For the fineſt *yellows*, they firſt boil the cloth, or ſtuff, in allum and pot-aſhes; then give the colour with the weld, or would. See WELD.

Turmeric likewiſe gives a good *yellow*, though not the beſt. There is alſo an Indian wood that gives a *yellow* colour bordering on gold.— A fourth ſort of *yellow* is made with ſavory, but this is inferior to them all.

Greens are uſually made of *yellow*, and blue mixed. See GREEN.— With *yellow*, madder red, and goat's hair prepared with madder, are made the golden *yellow*, aurora, panſy, nacarate, iſabella, and chamois-colour; which are all caſts or ſhades of *yellow*.

Painters and enamellers make their *yellow* of maſſicot, which is ceruſs raiſed by the fire; or with yellow oker. See ENAMEL, and ENAMELING.— Limners and illuminers make it with ſaffron, and French berries, orcanette, &c.

Brantom obſerves, it was antiently the cuſtom to paint a man's door *yellow*, and ſtrew his houſe with ſalt; to declare him traitor to his king.

YELLOW, or *French berries*. See the article AVIGNON.

YELLOW *Jaundice*. See the article JAUNDICE.

YELLOWS, a diſeaſe in a horſe, much the ſame with that called *jaundice* in man. See JAUNDICE.

There are two kinds of it, the *yellow*, and the *black*.

The *yellows* is a very frequent diſorder, ſay the farriers, ariſing from obſtructions in the gall-pipe, or the little ducts opening into the ſame, occaſioned by viſcid or gritty matters lodged therein, or a plenitude and compreſſion of the neighbouring blood-veſſels; by means whereof, the matter that ſhould be turned into gall, is taken up by the vein, and carried into the maſs of blood; which it tinctures *yellow*: ſo that the eyes, inſide of the lips, and other parts of the mouth capable of ſhewing the colour, appear *yellow*.

The effect whereof is, that a horſe will be dull, heavy, and low-ſpirited; eaſily jaded by the leaſt labour or exerciſe, &c.

YEOMAN, the firſt or higheſt degree among the commons, or plebeians of England; next in order to the gentry. See COMMONS, and GENTLEMAN.

The *yeomen* are properly the freeholders, who have land of their own; ſo called from the Saxon *gemane*, or *geman*, common.— The word *yongman*, is uſed for *yeoman* in the ſtatute 33 Hen. VIII. and in an old deed it is ſometimes alſo written *jeman*, which, in the German, ſignifies any body.

According to Sir Thomas Smith, a *yeoman* is a free-born Engliſhman, who can lay out of his own free-land in yearly revenue, to the ſum of forty ſhillings ſterling.

The *yeomanry* of England, are capable of holding lands of their own to a good value; are adjudged capable of certain offices, as conſtables, church-wardens, jury-men, to vote in elections to parliament, and to ſerve in the army.

The *yeomen* were famous, in antient times, for military valour, being particularly expert at the management of the bow; whence the infantry was compoſed chiefly of them. See ARCHER.

In many caſes, the law conceives a better opinion of the *yeomanry*, that occupy lands, than of tradeſmen, artificers, &c. See FREEHOLDER.

By a ſtatute, 2 Henry IV. it is enacted, That no *yeoman* ſhall take or wear a livery of any lord, upon pain of impriſonment, and a fine at the king's pleaſure. See LIVERY.

YEOMAN, is alſo a title of office in the king's houſhold, of a middle place, or rank, between an uſher and a groom. See USHER, and GROOM.

Such are the— *Yeoman* of the pantry; *yeoman* of the ſcullery; *yeoman* of the ſtirrop, &c. See HOUSHOLD.

YEOMEN *Warders*. See WARDERS *of the Tower*.

YEOMEN *of the Guard*, properly called *yeomen of the Guard of the king's body*, were antiently 250 men, and of the beſt rank under gentry, and of larger ſtature than ordinary; every one being required to be ſix feet high. See GUARD.

At preſent there are but one hundred *yeomen* in conſtant duty; and ſeventy more not in duty; and as any of the hundred die, his place is ſupplied out of the ſeventy.

They go clad after the manner of King Henry the eighth's times.— They had diet as well as wages, when in waiting, but this was taken off in the reign of queen Anne.

Their attendance is on the ſovereign's perſon, both at home, and abroad; and they have a room allotted for them only, called the *guard-chamber*.

The officers and *yeomen* are at the diſpoſal of the captain, but the captain at the appointment of the king.

YERKING, in the manage, is when a horſe ſtrikes with his hind legs, or flings and kicks back with the whole hind quarters; ſtretching out the two legs nearly together, and even to their full extent. See AIR, SALT, &c.

YEST, or *Barm*, a head, or ſcum riſing upon beer, or ale, while working or fermenting in the vat. See BREWING, MALT-*Liquor*, &c.

It is uſed for a leven or ferment in the baking of bread; as ſerving to ſwell or puff it up very conſiderably in a little time, and to make it much lighter, ſofter, and more delicate.— When there is too much of it, it renders the bread bitter. See BAKING.

The uſe of *yeſt* in bread, is but of late ſtanding among us: it is not above eighty years ſince the avarice of the bakers firſt introduced it; and then it was only done by ſtealth.— Though Pliny witneſſes it to have been uſed by the antient Gauls.

The faculty of medicine of Paris, by a decree of the 24th of March 1688, ſolemnly maintained it noxious to the health of the people; yet could not that prevent its progreſs. See BEER, BREWING, &c.

YEZDEGERDIC *Year*. See *Perſian* YEAR.

YGROMETER. See the article HYGROMETER.

YIELDING *and paying*, a law phraſe, formed by corruption from the Saxon *geldan*, or *gildan*, to pay.— Hence, in Domeſday, *gildare* is frequently uſed for *ſolvere*, *reddere*; the Saxon G being eaſily converted into a Y. See GELD, and GILD.

YNCA, YNCAN, or INCA, an appellation antiently given to the kings of Peru, and the princes of their blood; the word ſignifying, literally, *lord*, *king*, *emperor*, and *royal blood*. See INCA.

The king himſelf was particularly called *capac ynca*, *i. e.* great lord.— His wife, *pallas*, and the princes ſimply, *ynca's*. Theſe *ynca's*, before the arrival of the Spaniards, were exceedingly powerful.— Their people revered them to exceſs, as believing them to be ſons of the ſun, and never to have committed any fault.— If any perſon offended the royal majeſty in the ſmalleſt matter, the city he belonged to was totally demoliſhed.

When they travelled, whatever chamber they lay in on the road, was walled up as ſoon they departed, that no body might ever enter in after them.— The like was done to the room wherein the king died; in which, likewiſe all the gold, ſilver, and precious furniture were immured, and a new apartment built for his ſucceſſor.

His beloved wives, domeſtics, &c. likewiſe ſacrificed themſelves, and were buried alive in the ſame tomb along with him. See the *Hiſtory of the* Yncas, by Garcilaſſo de la Veſia.

YOAK, or YOKE, in agriculture, a frame of wood, fitted over the necks of oxen; whereby they are coupled together, and harneſſed to the plough, &c. See PLOUGH.

It conſiſts of ſeveral parts; as, the *yoke* properly ſo called, which is a thick piece of wood, lying over the neck; the *bow*, which compaſſes the neck about; the *ſtitchings* and *wreathings*, which hold the bow faſt in the *yoke*; and the *yoke-ring*, and *ox-chain*.

The Romans made the enemies they ſubdued, paſs under the *yoke*, which they called *ſub jugum mittere*: that is, they made them paſs under a ſort of *furcæ patibulares*, or gallows, conſiſting of a pike, or other weapon laid acroſs two others planted upright in the ground.— This done, they treated them with humanity enough, and ſent them home again. See FURCA.

The ſame meaſure was ſometimes dealt them by their enemies upon the ſame occaſion.— Thus Cæſar, Lib. II. obſerves, that the conſul L. Caſſius, had been killed by the Swiſs, his army defeated, and made paſs under the *yoak*.

YOAK *of Land*, *jugata terræ*, in our antient cuſtoms, was the ſpace which a *yoke* of oxen, that is, two oxen, may plough in one day. See HIDE, YARD-*Land*, &c.

Sea-YOAK. See the article SEA.

YOIDES*, or HYOIDES, in anatomy, a bone ſituate at the root of the tongue, and compoſed of divers little bones, united by cartilages, which ſometimes oſſify. See HYOIDES.

* It has its name υοειδης, and ſometimes υψιλοειδης, *ypſiloides*, from its reſembling a Greek *υ*, or upſilon.— Some call it *lambdoides*, as reſembling a lambda inverted.

It is not contiguous to the extremity of any other bone, nor has any articulation with them: on which account, it is not ſhewn in the ſkeletons.

Its uſe is to fortify the baſe or root of the tongue, and facilitate the paſſage of the air into the trachea, and the food into the gullet.— It has five pair of muſcles, which move it together with the tongue. See TONGUE.

YOLK, or **YELK**, in natural hiſtory, the yellow part in the middle of an egg. See EGG.

The chicken is formed out of, and nouriſhed by the white alone, till it be grown to ſome bulk: after which, the *yolk* ſerves it for nouriſhment; which it likewiſe does, in part, after it is hatched. — For a good part of the *yolk* remains after excluſion; being received into the chicken's belly: and being there reſerved, as in a ſtore-houſe, is by the ductus inteſtinalis, as by a funnel, conveyed into the guts, and ſerves inſtead of milk. *Willugh. Ornithol.* Lib. I. c. 3.— This was even known to Pliny: *Ipſum animal ex albo liquore ovi corporetur: cibus ejus in luteo eſt.* Lib. X. c. 53.

YOUNG. See GENERATION, CONCEPTION, GESTATION, EMBRYO, FOETUS, DELIVERY, CHILD, &c. ſee alſo STORGE, &c.

In the army, that regiment or officer, is ſaid to be the *younger*, *junior*, which was laſt raiſed, or whoſe commiſſion is of lateſt date, whatever be the age of the man, or however long he may have ſerved in other capacities.

YOUNKERS, among ſailors, are the *younger* ſailors, otherwiſe called *foremaſt-men*; whoſe buſineſs is to take in the top-ſails, furl the ſails, ſling the yards, &c.

YOUTH, *Adoleſcence.* See AGE, and ADOLESCENCE.

YPSILOIDES, ΥΨΙΛΟΕΙΔΗΣ, in anatomy, the third genuine ſuture of the cranium; thus called from its reſembling a Greek *y*, or upſilon. See SUTURE.

Some alſo call it λαμϐδοειδης, *lambdoides*. See LAMBDOIDES.

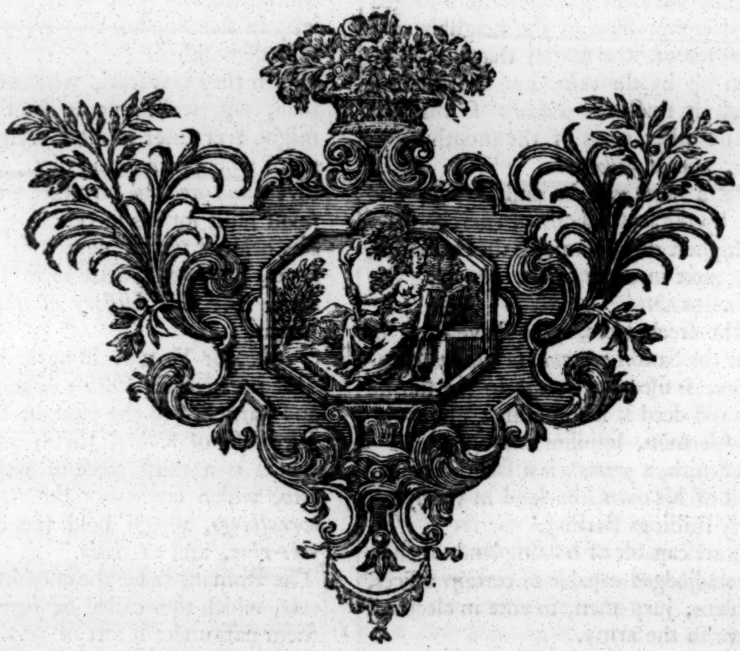
There is alſo a bone at the root of the tongue, called *ypſiloides*, and *yoides*. See YOIDES.

YQUETAYA, in natural hiſtory, a plant in Braſil, long uſed as a medicine in that country; and lately diſcovered to the Europeans by a French ſurgeon.

It has been ſince found in France, where, being cultivated and examined by M. Marchant, it appears to be a kind of ſcrophulary, or blood-nettle.

It has this remarkable property, that it takes away from ſenna all its ill taſte and ſmell; which property of correcting the infuſion of ſenna, was unknown in the ſcrophulary. See SENNA.

To uſe this plant, it muſt be dried ten or twelve days in the ſhade, and afterwards expoſed to the ſun, till quite dry.



Z.

Z, The laſt letter in the alphabet, and one of the double conſonants, both among the Latins and Greeks. See LETTER, and CONSONANT.

Its pronunciation is much more ſoft and obtuſe than the x, which makes Quintilian call it *jucundiſſima*, and *dulciſſima*.— Nevertheleſs, the ſound was not always the ſame as it is now; which is but, as it were, half that of an S. See S.

It had ſomething alſo in it of the d; but only what ſounded very ſmoothly: Thus, *Mezentius* was pronounced, as if it had been *Medſentius*, &c. See D.

The Z had alſo an affinity with the g: Thus Capella; *z à Græcis venit, licet etiam ipſi primo* g *Græcâ utebantur*. See G.

Z was alſo a numeral letter, ſignifying 2000; according to the verſe:

Ultima z tenens, finem bis mille tenebit.

When a daſh was added a-top $\overline{Z}$, it ſignified two thouſand times two thouſand.

ZAIM, a portion of land, allotted for the ſubſiſtence of a horſe-man in the Turkiſh militia; called alſo *timar*. See TIMAR, and TIMARIOT.

ZAIRAGIA, or ZAIRAGIAH, a kind of divination in uſe among the Arabs; performed by means of divers wheels or circles, placed concentric to one another, and noted with ſeveral letters which are brought to anſwer to each other, by moving the circles according to certain rules. See DIVINATION.

This is alſo called *zaraiah*, by reaſon the circles of this machine, which are called *mutazariat*, *laſlak*, &c. correſpond to the orbs of the planets, and the atmoſpheres of the ſeveral elements.

ZAPATA*, or *Sapata*, a kind of feaſt, or ceremony held in Italy, in the courts of certain princes, on S. Nicholas's day, wherein people hide preſents in the ſhoes or ſlippers of thoſe they would do honour to, in ſuch manner, as they ſurprize them on the morrow when they come to dreſs.

* The word is originally Spaniſh, *capato*, and ſignifies a ſhoe, or ſlipper.

It is done in imitation of the practice of S. Nicholas, who uſed, in the night-time, to throw purſes of money in at the windows, to marry poor maids withal.

F. Meneſtrier has deſcribed theſe *zapatas*, their origin, and different uſages, in his treatiſe *des ballets anciens, & moderns*.

ZEAL, ZELUS, ζηλος, the exerciſe of a warm animated affection, or paſſion for any thing. See PASSION, &c.

Some will have *zeal* to be properly a mixt, or compound ſenſation, where one affection is raiſed or inflamed by another. — On theſe principles, it may be defined an affection ariſing from love and indignation, which cannot bear a thing to be given to another, that a perſon deſires for himſelf, or one whom he loves and favours.— Others make it conſiſt in an eager ſtudy, or deſire to keep any thing inviolate; or a fervour of mind, ariſing from an indignation againſt thoſe who abuſe or do evil to a perſon beloved.

The Greek philoſophers make three ſpecies of *zeal*.— The firſt, of *envy*: the ſecond, of *emulation*, or imitation: the third of *piety*, or devotion; which laſt makes what the divines call *religious zeal*. See EMULATION, &c.

Joſephus ſpeaks much of a party or faction, called the *zealous*, or *zealots*, which aroſe among the Jews during the war with Veſpaſian and Titus. Lib. XIV. c. 6. *Antiq.* and Lib. IV. c. 12. *de Bello Judaico*.

ZECHIN, or ZECCHINO. See the article SEQUIN.

ZEDOARY, ZEDOARIA, a medicinal root, belonging to a plant growing in the Eaſt-Indies, whoſe leaves are like thoſe of ginger, only longer and broader. See ROOT.

Zedoary is of an aſh-colour, has an aromatic, bitteriſh taſte; and is ranked in the claſs of cephalics: but it is alſo reckoned, by many, amongſt the alexipharmics, whereupon it comes to have a place in the capitals; and is even ſaid to prevent infection, by holding it only in the mouth. See ALEXIPHARMIC, &c.

On account of its agreeable bitter, it is alſo preſcribed among ſtomachics; and for its ſpicy warmth, is commended in colics, and hyſterical affections, for promoting the menſes, &c. See AROMATIC.

ZENITA, in aſtronomy, the vertical point; or a point in the heavens directly over our head. See VERTEX, and VERTICAL.

Or, the *zenith* is a point, as Z (*Tab. Aſtronomy*, *fig.* 52.) in the ſurface of the ſphere, from which a right line, drawn through the ſpectator's head, paſſes through the centre of the earth. See VERTEX, and VERTICAL.

Hence, there are as many *zenyths* as there are different places on the earth, where the heavens may be ſeen; and upon the changing our place, we alſo change our *zenith*.

The *zenith* is alſo called the *pole of the horizon*, becauſe 90 degrees diſtant from each point thereof. See HORIZON.

It is alſo the pole of all the almucantars, or parallels of the horizon, whereby the altitude of the ſtars is eſtimated. See ALMUCANTAR.

Through the *zenith* paſs the vertical-circles, or azimuths. See VERTICAL-*Circle*, and AZIMUTH.

The point diametrically oppoſite to the *zenith*, is called the *nadir*; which is the point directly under our feet. See NADIR.

The nadir is the *zenith* to our antipodes; as our *zenith* is the *nadir* to them. See ANTIPODES.

ZENITH-*Diſtance*, is the complement of the ſun's, or a ſtar's meridian altitude; or what the meridian altitude wants of 90 degrees. See COMPLEMENT, and ALTITUDE.

ZENSUS, in arithmetic, a name which ſome authors give to a ſquare number; or the ſecond power. See SQUARE *Number*, and POWER.

The higher powers they call *zenſizenſus*, *zenſicubus*, *zenſizenzenſus*, *zenſurdeſolidus*, &c. See POWER.

ZEPHYRUS*, or ZEPHYR, the weſt-wind; a wind blowing from that cardinal point of the horizon oppoſite to the eaſt. See WEST, WIND, and CARDINAL-*Point*.

* The word is Greek, ζεφυρος.— The poets perſonify it.

It is alſo called *favonius*, and *occidens*; and by many confounded with *africus*.

ZEST, the woody, thick ſkin, quartering the kernel of a walnut.— Some phyſicians preſcribe *zeſt*, dried and taken with white-wine, as a remedy againſt the gravel.

The word is alſo uſed for a chip of orange or lemon-peel; ſuch as is uſually ſqueezed into ale, wine, &c. to give it a flavour.

Hence, to *zeſt* an orange or lemon, among confectioners, is to cut the peel from top to bottom into ſmall ſlips, as thin as poſſible.

ZETA*, or ZETECULA, a little cloſet, or withdrawing-chamber, with pipes running along the walls, to receive, from below, either the cool air, or ſteam of warm water. See CALEDUCT, HYPOCAUSTUM, &c.

* The word is formed either from ζειν, to be warm; or of ζην, *vivere*, to live, on account of the uſe made hereof for love and enjoyment.

ZETETICE*, ZETETIC-*Method*, in mathematics, the method made uſe of to inveſtigate, or find the ſolution of a problem. See RESOLUTION, PROBLEM, &c.

* The word is Greek, ζητητικη, formed from ζητεω, I ſeek.

The antient Pyrrhanians were ſometimes called *zetetici*, *q. d.* ſeekers. See PYRRHANIANS.

ZEUGMA*, a figure in grammar, whereby an adjective, or verb, which agrees with a nearer word, is alſo, by way of ſupplement, referred to another more remote. See FIGURE.

* The word is Greek, ζευγμα, which literally denotes a joining together: from ζευγνυω, I join.

Thus Terence, *Utinam aut hic ſurdus, aut hæc muta facta ſit.*— So Virgil, *Hic illius arma hic currus fuit.*— In which caſes, the words *facta ſit*, agreeing primarily with *hæc muta*, are alſo made to agree or extend to *hic ſurdus*: and the verb *fuit*, is not only referred to *hic currus*, which it properly reſpects, but further, to *hic illius arma*.

The Latins, it may be here obſerved, take a liberty in conſtruction, which ſome of the nicer critics among the moderns, particularly the French, will not allow in the modern tongues. See CONSTRUCTION.

ZIBETHUM, or ZIBETTA, in natural hiſtory, *civet*; a perfume like muſk, contained in a kernally bladder, in the groin of a civet cat. See CIVET.

ZICZAC. See the article ALLEY *in Ziczac*.

ZINDIKITES, a ſect among the Mahometans, denominated from their leader Zindik, whom Grotius makes to be one of the magi, and a follower of Zoroaſter. See MAGI.

The *Zindikites* believe no providence nor reſurrection.— They allow no other God but the four elements; and in this ſenſe aſſert, that a man, being a mixture of thoſe ſimple bodies, returns to God when he dies.

ZINK, a kind of metalline ſubſtance, very hard, white, and brilliant; and which, though not ductile enough to denominate it a metal, yet ſtretches a little under the hammer. See METAL, DUCTILITY, &c.

Zink is the ſame with what is otherwiſe called *ſpelter*, and uſed to purge and purify tin; much as lead is to purify gold, ſilver, and copper. See SPELTER, and LEAD.

Founders, toymen, &c. alſo uſe it with turmeric to tinge copper, &c. It gives a fine gold colour, though not a very laſting one. See COPPER, BRASS, &c.

M. Homberg conjectures, with a good deal of probability, that *zink* is no other than a natural mixture of two real metals, *viz.* tin, and iron.— What led him to the opinion was, that *zink* yields preciſely the ſame fumes by the burning-glaſs, as ſuch a mixture does.— Accordingly, he aſſures us, he often ſubſtituted the one for the other; and this always with the very ſame effect.

ZINZIBER, or ZINGIBER. See the article GINGER.

ZIZYPHA, or ZIZYPHUS, a name ſometimes given to a kind of fruit, more uſually called *jujub.* See JUJUB.

ZOCCO, ZOCCOLO, ZOCLE, or SOCLE, in architecture, a kind of ſtand or pedeſtal; being a low, ſquare piece, or member, ſerving to ſupport a buſto, ſtatue, pedeſtal, or the like thing, that needs to be raiſed. – See *Tab. Archit. fig.* 24. *lit. z.* ſee alſo the article SOCLE.

ZODIAC*, ZODIACUS, in aſtronomy, a faſcia, or broad circle, whoſe middle is the ecliptic, and its extremes two circles parallel thereto, at ſuch diſtance from it as to bound, or comprehend the excurſions of the ſun and planets. See SUN, and PLANET.

* The word is formed from the Greek ζωον, animal; by reaſon of the conſtellations therein: others derive it from ζωη, life; from an opinion that the planets have a great influence on animal life.

The ſun never deviates from the middle of the *zodiac*; *i. e.* from the ecliptic; the planets all do, more or leſs. See ECLIPTIC.

Their greateſt deviations, called *latitudes*, are the meaſure of the breadth of the *zodiac:* which is broader, or narrower, as the greateſt latitude of the planets is made more or leſs.— Accordingly, ſome make it 16, ſome 18, and ſome 20 degrees broad. See LATITUDE.

The *zodiac* cutting the equator obliquely, makes an angle therewith of 23 degrees and an half; or more preciſely of 23°, 29′, which is what we call the *obliquity of the zodiac*, and is the ſun's greateſt declination. See OBLIQUITY, and DECLINATION.

The *zodiac* is divided into twelve portions, called *ſigns*; and thoſe diviſions or ſigns are denominated from the conſtellations which antiently poſſeſſed each part. See CONSTELLATION.— But the *zodiac* being immoveable, and the ſtars having a motion from weſt to eaſt, thoſe conſtellations no longer correſpond to their proper ſigns; whence ariſes what we call the *preceſſion of the equinoxes.* See PRECESSION.

When a ſtar, therefore, is ſaid to be in ſuch *a ſign of the zodiac*, it is not to be underſtood of that ſign, or conſtellation of the firmament; but only of that twelfth part of the *zodiac*, or dodecatemory thereof. See SIGN, STAR, and DODECATEMORY.

Caſſini has alſo obſerved a track in the heavens, within whoſe bounds moſt of the comets, though not all of them, are obſerved to keep; which, for this reaſon, he calls the *zodiac of the comets.* See COMET.

This he makes as broad as the other *zodiac*, and marks it with ſigns or conſtellations like that; as Antinous, Pegaſus, Andromeda, Taurus, Orion, the leſſer Dog, Hydra, the Centaur, Scorpion, and Sagittary.

ZONE*, ZONA, in geography and aſtronomy, a diviſion of the terraqueous globe, with reſpect to the different degree of heat found in the different parts thereof. See EARTH, and HEAT.

The word is Greek, ζ ν, q. d. belt, girdle.

A *zone* is the fifth part of the ſurface of the earth, contained between two parallels. See PARALLEL.

The *zones* are denominated *torrid*, *frigid*, and *temperate.*

Torrid ZONE, is a faſcia, or band ſurrounding the terraqueous globe, and terminated by the two tropics, See TROPIC.— Its breadth, therefore, is 46°, 58′. The equator running through the middle of it, divides it into two equal parts, each containing 23°, 29′.

The antients imagined the *torrid zone* uninhabitable. See TORRID.

Temperate ZONES, are two faſciæ, or bands environing the globe, and contained between the tropics, and the polar circles. – The breadth of each is 43°, 2′. See TEMPERATE.

Frigid ZONES, are ſegments of the ſurface of the earth terminated, the one by the antarctic, and the other by the arctic circle.— The breadth of each is 46°, 58′. See ARCTIC, ANTARCTIC, &c.

The difference of *zone* is attended with a great diverſity of phænomena.— 1°. In the torrid *zone*, the ſun paſſes through the zenith twice a year; and his receſs from the equator towards the pole which is above the horizon, is twice a year equal to the heighth of the pole.

2°. In the temperate and frigid *zones*, the leaſt heighth of the pole exceeds the greateſt diſtance of the ſun from the equator; and therefore, to the inhabitants thereof, the ſun never paſſes through the zenith; yet if on the ſame day the ſun riſes at the ſame time to a greater heighth, the heighth of the pole is the leſs, in regard the inclination of the circles of diurnal revolution to the horizon is leſs.

3°. In the temperate and torrid *zones*, the ſun riſes and ſets every natural day, by reaſon the diſtance of the ſun from the pole always exceeds the heighth of the pole; yet every where but under the equator, the artificial days are unequal, and the inequality is the greater as the place is leſs diſtant from the frigid *zone.* See DAY.

4°. Where the temperate *zones* terminate on the frigid, the heighth of the pole is equal to the ſun's diſtance from the pole, when in the neighbouring tropic; and, conſequently, once a year, the ſun, in its diurnal motion, performs an entire revolution, without going down under the horizon.

5°. Every where in a frigid *zone*, the heighth of the pole is greater than the leaſt diſtance of the ſun from the pole; and therefore during ſome revolutions of the earth, the ſun is at a diſtance from the pole leſs than the pole's heighth; and during all that time, does not ſet, nor ſo much as touch the horizon.— Where the diſtance from the pole, as the ſun recedes from it, exceeds the heighth of the pole, or latitude of the place, the ſun riſes or ſets every natural day. See DAY, NIGHT, RISING, SETTING, &c.

ZONNAR*, a kind of belt, or girdle of black leather, which the Chriſtians and Jews of the Levant, particularly thoſe in Aſia, and the territories of the grand ſeignior, are obliged to wear; to diſtinguiſh themſelves from the Mahometans.

* The word is corrupted from the vulgar Greek, a contraction of ζωναριον, of ζωνη, girdle.

It was Motavakkel X. kaliph, of the family of the Abaſſides, that firſt enjoined the Chriſtians, &c. to wear the *zonnar.* The ordinance to this effect was publiſhed in the year of the Hegira 235.

Hence, as moſt of the Chriſtians of Syria, Meſopotamia, &c. are either Neſtorians, or Jacobites; thoſe ſectaries are often called *Chriſtians of the girdle.* See GIRDLE.

ZOOLOGIA*, ZOOLOGY, a diſcourſe, or treatiſe upon animals, or living creatures. See ANIMAL.

Zoology makes a conſiderable article in natural hiſtory; comprehending what relates to the form, ſtructure, method of living, feeding, propagating, &c. of the divers ſpecies of brute creatures. See NATURAL *Hiſtory.*

* The word is Greek, ζωολογια, comprehended of ζωη, life, and λογος, ſpeech, diſcourſe.

ZOOPHORIC *Column*, is a ſtatuary column; or a column that bears or ſupports the figure of an animal. See COLUMN.

ZOOPHORUS, or ZOPHORUS, in the antient architecture, the ſame thing with the *frieze* in the modern. See FRIEZE.

It was thus called in Greek, becauſe antiently adorned with the figures of animals; from ζωον, animal, and φερω, I bear. The Greeks ſometimes alſo call the zodiac, *zoophorus*, becauſe of the ſigns and conſtellations therein. See ZODIAC.

ZOOPHYTON*, ZOOPHYTE, in natural hiſtory, a kind of intermediate body, partaking both of the nature of a ſenſitive, and a vegetable.

* The word is Greek, ζωοφυτον, compounded of ζωον, animal, and φυτον, plant, *q. d.* plant-animal.

Such is the planta pudica commonly ſuppoſed to be; though with little foundation. See SENSITIVE *Plant.*— The antients alſo reputed ſponges to be *zoophytes.* See SPONGE.

The fœtus, while in the womb, appears to be a real *zoophyte*; growing to the mother by the funiculus umbilicalis, as plants do to the earth by their ſtem. See FOETUS, EMBRYO, &c.

Olearius mentions a very extraordinary ſort of *zoophyte*, called *agnus Scythicus*, or *borametz*, growing near Samara on the Volga.— It is a kind of melon ſhaped like a lamb, all the parts whereof it has, and grows to the earth by a ſtem, which ſerves it for a navel-ſtring.— As it grows, it changes place as much as its ſtem will allow of; and it conſumes and dries up all the graſs where it grows.— When ripe, the ſtem withers, and the body, or fruit, becomes covered with a downy ſkin, which may be dreſſed, and uſed as fur.

Olearius was ſhewn ſome of this ſkin, taken off the covering of a bed; which the people ſwore came from the fruit; but he could hardly believe them: it was covered with a ſoft curled wool, like that of a young lamb.— Scaliger adds, that this fruit lives, and grows, till ſuch time as it wants graſs.— But what credit is to be given to moſt of the marvellous in theſe accounts, may be ſeen in *Philoſoph. Tranſ.* n. 247. p. 461. and n. 390. p. 353. The ſkin ſhewn to Olearius was, in all probability, ſuch as thoſe deſcribed by Breynius from Kæmpfer, in the forecited *Tranſact.* n. 390.

ZOOTOMY*, ΖΩΟΤΟΜΗ, the art or act of diſſecting animals, or living creatures. See DISSECTION.

* The word is compounded of ζωον, animal, and τεμνω, *ſeco*, I cut.

Zootomy amounts to the ſame with *anatomy*, or rather *comparative anatomy.* See ANATOMY, and COMPARATIVE.

ZOPHORIC. See the article ZOOPHORIC.

ZOPHORUS. See the article ZOOPHORUS.

ZOPISSA*, ΖΩΠΙΣΣΑ, *Naval-pitch*; a kind of mixture of pitch and tar, ſcraped off ſhips that have been a long time at ſea. See PITCH, and TAR.

* The word ſeems formed from ζεω, *bullio*, I boil, and πισσα, pitch; *q. d.* boiled, or concocted pitch

This matter, by being gradually penetrated by the ſalt of the ſea, becomes partaker of its qualities; and being applied to the body externally, is found reſolutive and deſiccative.

ZUINGLIANS, a branch of antient Reformers or Proteſtants; denominated from their author Uldric, Huldric Zuinglius. See REFORMATION.

This eminent divine was born at Wildehauſen, in the county of Toggenbourg in Switzerland, in 1487.— After having finiſhed his ſtudies in theology, and received the doctor's cap at Baſil, in 1505, he applied himſelf to preaching; and with good ſucceſs.

Soon after Luther had taken up arms againſt Rome, Zuinglius, being then miniſter of the chief church in Zurich, fell in with him; preached openly againſt indulgencies, then againſt the interceſſion of the ſaints, then againſt the maſs, the hierarchy, the vows, and celibacy of the clergy, abſtinence from fleſh, &c.

As to the euchariſt, interpreting *hoc eſt corpus meum* by *hoc ſignificat corpus meum*, he maintained, that the bread and wine were only bare ſignifications, or repreſentations of the body and blood of Jeſus Chriſt; in which he differed from Luther, who held a conſubſtantiation. See LUTHERANS, EUCHARIST, CONSUBSTANTIATION, &c.

In a conference held with the deputies of the biſhop of Conſtance, in 1523, he procured moſt of the external ceremonies of religion to be aboliſhed.— As to matters of grace, Zuinglius ſeemed inclined to Pelagianiſm; giving all to free-will, conſidered as acting by the mere ſtrength of nature; in which he differed from Calvin. See CALVINISM, GRACE, PELAGIAN, &c.

ZYGOMA*, ΖΥΓΩΜΑ, in anatomy, a bone of the head, otherwiſe called *os jugale*. See BONE.

* The word is formed from ζευγνυμαι, I join; ſo that *zygoma*, properly ſpeaking, is the juncture of thoſe two bones

The *zygoma* is no ſingle bone, but an union or aſſemblage of two proceſſes, or eminences of bones; the one from the os temporis, the other from the os malæ.— See *Tab. Anat. (Oſteol.) fig.* 2. *lit. c*; ſee alſo the article *Os* TEMPORIS.

Theſe two eminences, or apophyſes, are joined together by a ſuture, thence called *zygomaticus*. See ZYGOMATICUS.

ZYGOMATICUS, a muſcle of the head, which has its origin in the proceſſus jugalis, or zygoma; and paſſing obliquely, is inſerted near the angle of the lips.— It helps to draw the lips obliquely upwards.— See *Tab. Anat. (Myol.) fig.* 1. *n.* 9. *fig.* 6. *n.* 4. *fig.* 7. *n.* 2; ſee alſo LIPS.

ZYGOMATICUS, is alſo an epithet given to the ſuture that binds the two proceſſes of the *zygoma* together. See ZYGOMA, and SUTURE.

ZYMOSIMETER*, an inſtrument propoſed by Swammerdam, in his book *de Reſpiratione*, wherewith to meaſure the degree of fermentation occaſioned by the mixture of different matters; and the degree of heat which thoſe matters acquire in fermenting; as alſo the heat or temperament of the blood of animals. See FERMENTATION, HEAT, &c.

* The word is formed from ζυμωσις, fermentation, and μετρον, meaſure.

ZYTHUM, or ZYTHOS, a ſort of malt-liquor, in uſe among the antient Germans. See MALT-*Liquor*.

Matthiolus repreſents the antient *zythum*, and curmi, as the ſame with our beer and ale. See BEER, and ALE.
